ARNOLD, BENEDICT, was born in Connecticut in North America, of parents in very humble life. He is said to have received little education, and to have been at first a dealer in horses. Having been unfortunate in business, he was the more ready, when the revolutionary war broke out, to take up arms, for which he was well fitted both by inclination and capacity. He threw himself into the contest with great ardour, and raised a company of volunteers at Newhaven, in his native state. His activity, boldness, and skill, soon brought him into notice; and when in the summer of 1775 it had been determined to attempt the capture of Quebec, he and General Montgomery were fixed upon by Washington to conduct the expedition. The march of Arnold across a then unknown and pathless region at the close of the year, is one of the boldest military exploits on record. The troops, consisting of about 1100 men, set out about the middle of September from Boston for Newbury Port, at the mouth of the Merrimack; from which point they were conveyed by water to the mouth of the Kennebeck in New Hampshire, a distance of forty leagues. On the 22d they embarked in 200 boats on the Kennebeck at Gardener's Town, and made their way up the river in the face of such a variety of difficulties, that their progress was never more than ten, and sometimes not more than four miles a day. After reaching the head of the river, they had a work of nearly as great fatigue and difficulty still before them—the passage of the mountainous ridge which now divides the territory of the United States from Canada. It was only after crossing these desolate heights that they reached the river Chaudière, down which they proceeded to the St. Lawrence, into which it falls. When they at length reached a house, on the 3d of November, they had been thirty-one days without the sight of a human habitation.

Arnold distinguished himself greatly in the military operations that followed; and was severely wounded in the leg in the unsuccessful assault upon Quebec on the 31st of December, in which General Montgomery fell. On his return from this enterprise he continued in active service, and gave on many occasions the highest proofs of bravery and military talent. In one of the actions which immediately preceded the surrender of General Burgoyne at Saratoga on the 16th of October, 1777, his wounded leg was struck, while he was on horseback, by a cannon-ball; and this accident rendering him unable for some time to take the field, he was appointed by Washington to the command of Philadelphia, which the English had recently evacuated. In this situation the vices of his character soon began to display themselves; and he was guilty of such acts of rapacity and oppression, in order to support the ostentation and luxury in which he indulged, that on a representation being made to congress he was ordered to be tried by a court-martial. The result was, that on the 20th of January, 1779, he was sentenced to be reprimanded by the commander-in-chief. On this dishonour Arnold threw up his commission. The embarrassment of his affairs, however, was so great, and the demands of his creditors became so pressing, that he soon found it necessary to attempt something to repair his broken fortunes. In these circumstances he appears to have formed the deep and atrocious design for which his name is now chiefly remembered, and by which it has

been covered with infamy. He resolved to make an offer to the British General, Sir Henry Clinton, of his services in betraying his country and the cause for which he had hitherto fought. His proposals were accepted, and it was agreed that he should employ all his art and interest in order to obtain the command of the important fort of West Point on the Hudson, with the view of delivering it up to the enemy. By a show of strong patriotism, which he resumed, he was not long in accomplishing this object. Washington, generously forgetting his former delinquencies, was prevailed upon to appoint him to the station in question. This was in July, 1780. We refer to the article *ANDRÉ*, for an account of the manner in which this treasonable scheme miscarried. Major André was the person intrusted by Clinton with the active management of the negotiation with Arnold; and the British officer having been sent up the Hudson in a sloop of war from New York, the head-quarters of the army, had an interview with the American General on the bank of the river, near West Point, on the morning of Friday the 22d of September. The next day, on his return to New York by land, he was taken by two Americans when he had nearly reached the British lines, and the plot was detected by the discovery in his boots of the plans and other papers which he had received from Arnold. By the irresolute and inconsiderate conduct of Colonel Jameson, the officer to whom André was carried, he found means to convey an intimation of his capture to Arnold, by whom it was received on the morning of the 25th, just in time to permit him to make his escape. Taking a hurried leave of his wife and infant child, he instantly rushed to the river, and leaping on board a barge which he had in readiness, he ordered himself to be rowed to the English sloop, which he reached in safety. A minute and interesting account of all the circumstances of this affair may be found in the notice of Arnold in the *Encyclopædia Americana*. He was allowed to retain in the British army the rank of brigadier-general, which he had held in that of the United States; but it is asserted by the writer to whom we have just referred, that he did not receive the whole of the sum (30,000*l.*) which was promised him as the reward of his treachery. He attempted to do something to deserve what he got by publishing certain addresses and proclamations, with the view of inducing his countrymen to lay down their arms; but these attempts were not more successful than one of a different description by which they had been preceded. In the beginning of the following year he was sent with an expedition into Virginia, where he committed great devastation. After this he made a still more destructive incursion into Connecticut, his native state. Having taken Fort Trumbull, near New London, he barbarously put the unresisting garrison of the fort to the sword, and set the town on fire. He served afterwards in Nova Scotia, and also in the West Indies, where he was taken prisoner by the French, from whom, however, he made his escape. After the conclusion of the war he took up his residence in England. We find pensions to the amount of 400*l.* granted in 1792 to the children of a Benedict Arnold, whom we presume to be the subject of the present notice. In July of that year a duel was fought near Kilburn Wells, between General Arnold and the present Earl of Lauderdale, in consequence of certain expressions which the latter had used at a public meeting, and would not retract. Arnold was attended by Lord Hawke, and Lord Lauderdale by Mr. Fox. His lordship declined to return his adversary's fire, but said, that if he was not satisfied he might fire on till he was. On this the parties separated. Arnold died in Gloucester Place, London, in 1801.

ARNOLD, SAMUEL, Doctor in Music, was born in 1740, and patronised from his birth by the princess Amelia, daughter of George II., who placed him among the choristers of the royal chapel, under Mr. Bernard Gates: he afterwards completed his musical studies under Dr. Nares. His first production was an air, 'If 'tis joy to wound a lover,' which immediately spread itself far and wide, and, though a mere trifle, at once made the author popular. At the early age of twenty-three he became composer to Covent-garden theatre, and in 1766 also undertook to fill the same office at the Haymarket, then the property of the senior Colman. In the discharge of these duties, he produced about forty musical pieces, the most popular of which were, *The Maid of the Mill*, *The Son-in-law*, *The Castle of Andalusia*, in which are 'Flow, thou regal purple stream,' and 'The hardy Sailor' *Inkle and Yarico*; *The Battle of Hexham*; *The*

Surrender of Calais; *The Children in the Wood*; *The Mountaineers*, &c.; each containing beauties that never can be entirely forgotten. Of music of the graver cast, he composed Dr. Browne's sacred ode, *The Cure of Saul*, which was allowed to be the best work of the kind since the time of Handel. This was followed by the oratorios of *Abimelech*, *The Resurrection*, and *The Prodigal Son*, which were performed at Covent-garden and the Haymarket theatres for several years, during Lent. The latter was chosen for performance at the installation of Lord North, as chancellor of the University of Oxford, when the composer was honoured with the degree of Doctor in Music. In 1769 an enterprising spirit led him to purchase Marylebone Gardens, then a place of very fashionable resort, for which he wrote many songs, &c.; but, confiding too much in the honesty of those whom he employed, he abandoned this speculation with the loss of ten thousand pounds. In 1783 he was appointed organist and composer to the King. In 1789 he succeeded Dr. Cooke as conductor of the Academy of Antient Music; and in 1793 became organist of Westminster Abbey, on the presentation of his friend, Dr. Horsley, Bishop of Rochester. In 1786 Dr. Arnold commenced publishing an edition in score of Handel's works, encouraged by George III., who liberally supported him in his arduous undertaking, which proceeded to the extent of about forty volumes. He also printed, in four large volumes, a collection of sacred music, as a continuation of Dr. Boyce's admirable work, to which it has proved a most valuable addition. During many years he carried on the oratorios at Drury-lane theatre, and while these were in his hands, he produced *The Redemption*, a compilation from Handel's works, which met with the greatest success; and *The Triumph of Truth*, selected from various composers, but which has not kept its ground so well as the former, though by no means inferior in point of effect. Dr. Arnold died in 1802, and was interred in Westminster Abbey, with more than usual marks of respect. A simple tablet, near Purcell's monument, marks the place where he remains. He married a lineal descendant of the illustrious Baron of Merchiston, and left a son (who has distinguished himself by his dramatic productions, and by his able management of the English Opera House), and two daughters.

ARNOTTO, or **ARNATTO**, the inspissated extract from the fruit of the *Bixa Orellana* [see *BIXA*], is used by dyers principally to give a bright orange colour to silk goods. It is also employed as an auxiliary to give a deeper shade to simple yellow colours. It is further used in many of our dairies to give a reddish colour to cheese, which it does without adding any disagreeable flavour or unwholesome quality.

The Arnotto of commerce is brought to us from South America. It is moderately hard, brown on the outside, and of a dull red within. It comes in cakes of about two or three pounds weight each, and is generally enveloped in large flag-leaves previous to being packed in casks. In this state it receives the name of flag arnotto, to distinguish it from another preparation which is a harder and more concentrated extract from the fruit pods of the same plant, and which contains a larger proportion of colouring matter than flag arnotto. This superior description, of which but little is imported, is known as roll arnotto.

Arnotto is with difficulty dissolved in pure water; it is usual, therefore, to add some alkaline substance, usually potass, which not only facilitates the solution of the extract but improves the quality of the colour. The liquid sold under the name of Nankin dye is a solution of arnotto in potass and water. A solution is also sometimes made in alcohol, which is used for lacquering and by varnishers.

It is believed that the method employed for making this extract in the country of its production, which is by the application of a high degree of heat in combination with a process of fermentation, is injurious to its colouring properties, an opinion which is confirmed by the fact of the superiority of the colouring matter when procured from the fresh pods. There is reason to suppose that means might be used for precipitating the colouring matter without subjecting it to so great a risk of carbonization by heat as it is usually made to undergo, and without having recourse to the process of fermentation. Some experiments made with this view by Vauquelin seem to confirm this supposition.

The consumption of arnotto has been much increased in this country of late years. In 1820 the quantity brought to use but little exceeded 50,000 pounds. We now use more

than three times that quantity. It pays a duty on importation of 2*d.* per pound, and sells, including the duty, at from 10*d.* to 20*d.* per pound, according to its quality. (*Ann. de Chimie*, tome 47; Berthollet, *Elémens de l'Art de la Teinture*, tome ii.; *Library of Entertaining Knowledge* (Vegetable Substances, Materials of Manufacture); *Government Statistical Tables*.)

ARNSBERG (or Arensburg), the largest of the three circles, or governments, which form the Prussian province of Westphalia. In 1803, subsequently to the dissolution of the electorate of Cologne, it was united with the territory of Hesse Darmstadt, from which it was transferred to Prussia in the year 1813. It is bounded on the north-west by the circle of Münster, and on the north-east by that of Minden; on the east, by the principality of Waldeck, and Hesse Darmstadt; on the south-east and south, by the duchy of Nassau; on the south-west by the circle of Coblenz; and on the west, by those of Cologne and Düsseldorf. According to the latest measurement, its superficial extent is 2952 square miles; and its population, which the census of 1818 stated to be 383,405, amounted at the close of 1831 to 462,065 souls, of whom the majority are of the Protestant faith; the number of Catholics being in the proportion of 17 in 39 individuals. It contained, at that period, 38,147 horses and colts, 171,536 oxen and cows, and 160,938 sheep and goats. Arnberg comprehends the mediatised sovereignties of Witgenstein-Berleburg, Witgenstein-Witgenstein, and Hohen-Limburg; and, according to Schlieben's statement, 55 towns, 3420 villages and hamlets, 60,420 houses, 854 churches, chapels, and synagogues, and 5129 manufactories, mills, &c.

ARNSBERG, a minor circle in the government of Aa, 252 square miles in superficial extent, which had a population of 27,397 souls at the close of 1831, and contains 7 towns and 122 market-towns, villages, &c. The northern part of the circle, a considerable portion of which is occupied by the great forest of Arnberg, consists of valleys hemmed in by high hills and mountains; but its southerly districts have a more even surface. The soil is stony, but produces a sufficiency of grain, flax, and potatoes, for the consumption of the inhabitants; its more lucrative growth is the timber, which is felled in the forest of Arnberg, and exported in considerable quantities to the adjacent provinces, particularly the circle of the Mark, which has little wood of its own. The principal river in the circle of Aa, is the Ruhr, which rises at Winterberg, within its borders, and flows into the Rhine between Duisburg and Ruhrort. Its mineral resources consist of iron, marble, salt, and brick-earth; but its manufacturing industry is limited to the production of inconsiderable quantities of linens and woollens, together with utensils and articles of wood.

ARNSBERG, the capital both of the larger and lesser circle, is situated on a hill, surrounded on-almost every side by the Ruhr; it commands a delightful prospect of the mountainous and picturesque scenery around it, in which the ruins of the ancient castle in the old town, where the Westphalian barons used to meet in secret tribunal, form a striking feature. Arnberg is ill provided with water, its whole supply being derived from an hydraulic work which forces it up to the town from the river. It was a more thriving place in former times, when it was associated with the Hanseatic League; at the present day its chief dependence is on the production of potashes, and the manufacturing of brandy, beer, and a few linens and woollens. The principal buildings in the town are the government offices, two Catholic churches, a Protestant seminary for teachers, and a Catholic gymnasium: it has also an agricultural society. At the close of 1831, the number of inhabitants was 3805: which gives an increase of 1172 since the year 1817. 51° 22' N. lat. and 8° 2' E. long. of Greenwich; about forty miles in a direct line S.W. of Paderborn.

ARNSTADT, a seignior in Thuringia, forming part of the principality of Schwarzburg-Sondershausen. It contains 216 square miles, two towns (Arnstadt and Plauen), forty-two villages, and 23,000 inhabitants. Arnstadt (in 50° 49' N. lat., and 10° 57' E. long.) is the chief town and seat of government of the seignior, and is situated on both banks of the Gera, in the heart of a highly picturesque country, eleven miles south of Erfurt. It was formerly the residence of the earls, afterwards princes of Schwarzburg-Anhalt, but upon the extinction of the last of that line in 1716 it fell into the hands of its present possessors. It is embellished with a palace, in which are a

valuable cabinet of porcelain and a small picture-gallery. There are four churches in the town, the oldest of which goes by the name of the 'Early Church' (Früh-kirche), the service being performed in it at an earlier hour in the morning than in any other place of worship in the neighbourhood. The other public buildings consist of the ruins of a palace built in 1557, the government offices, a cemetery chapel, an orphan and a lunatic asylum, a gymnasium or grammar school, a seminary for the townsmen's sons, a house of correction, and several woollen and brass-ware manufactories. Its inhabitants, who are Lutherans, and in number nearly 5000, are actively engaged in trade: beer, leather, and linen are its staple. It is one of the most considerable marts for fruit, grain, and timber, in this quarter of Germany, and abounds in oil and flour mills, one of which, the 'Günther-mill,' has thirty sets of grindstones. A profusion of gardens and orchards lie scattered round the town; and the remains of two antient burghs, the Käfernburg and Altenburg, are striking features in its environs. The latter, which stands upon a hill commanding the delightful valley that spreads from its base, is said to have been the spot on which a Thuringian nobleman erected a house for the residence of our fellow-countryman, St. Boniface, the 'Apostle of the Germans,' in the seventh century. Plauen is a small town lying on the Gera, in the bosom of a beautiful valley. Its population is under 800.

ARNSWALDE, in the New-Mark, one of the eighteen circles of the Prussian government of Frankfurt, in the province of Brandenburg. Its area is 487 square miles, and its population at the close of the year 1831 was 28,185 souls. At that period it possessed 3,515 horses, 10,044 horned cattle, and 78,930 sheep and goats. It is bounded on the north and north-west by Pomerania, is watered by the Drage and some smaller rivers, and contains several small lakes. It has an abundance of forests, and a sandy soil, the poverty of which has been overcome by the industry of its possessors, and yields much grain and timber, besides feeding numerous herds and flocks.

ARNSWALDE, the capital of this circle, lies about 120 miles N.E. of Berlin, contains 3,550 inhabitants, a parochial church and two hospitals; it manufactures linens and woollens. It stands between three lakes, which are well-stocked with fish.

AROIDEÆ, an order of monocotyledonous plants, which approach dicotyledons in the form and veining of their

Arum maculatum.

1. A spatha with the point of the spadix seen within it; 2. the spadix separated; 3. the ripe fruit; 4. an ovary; 5. the same cut perpendicularly; 6. one of the little fruit cut perpendicularly; 7. a seed.

leaves, but agree with the former in everything else of importance. They are readily known by their flowers being placed very closely upon a cylindrical, or lengthened, axis, called technically a spadix (*fig. 2*), which is itself enclosed in a leaf of a peculiar figure, the edges of which are curved inwards till they meet, forming a sort of hollow sheath, which botanists name *spatha* (see *fig. 1* in the accompanying cut).

The fruit is generally a cluster of little berries, each of which contains a small number of seeds. The flowers themselves are extremely variable in structure; sometimes having neither calyx nor corolla, and sometimes possessing both those parts; sometimes furnished with anthers opening in a singular manner by little lobes, or having anthers of the commonest construction. Many of the species grow upon the trunks of trees, clinging to them, in tropical countries, like ivy; a very few are found in Europe, and those are always little stemless herbs; a small number are small erect shrubs. They are all acrid in a high degree, some of them so much so as to be dangerous poisons, as, for example, the dumb-cane of the West Indies, which paralyses the mouth if only chewed. Nevertheless this acrid principle is so far removed by roasting or boiling, that the underground stems may, in some cases, be used as food. The colocasia of the tropics, and some other species, are common articles of food among the negroes; but they are said not to agree very well with Europeans. In this country only one kind of aroidesous plant, the *Arum maculatum*, represented in the wood-cut, is found wild. The root of that species, which is vulgarly named the cuckoo flower, is eatable when properly prepared, just as those which have already been mentioned; but it is never used except by the poor in times of famine.

Aroides are also remarkable for the heat which some of the species give out when flowering (see Lindley's *Introduction to Botany*, p. 259), and for the exceedingly offensive odour of others at that time.

AROLSEN, on the Aar, twenty-three miles S. of Cassel, is the residence of the princes of Waldeck, who are among the oldest constitutional sovereigns in Germany. The town is regularly built, possesses woollen, leather, and iron-ware manufactories, a grammar-school, three churches, and about 2000 inhabitants. The palace is a handsome structure of spacious dimensions; it contains a gallery of choice paintings (amongst which is West's 'Death of General Wolfe'), a numismatic cabinet, which is richer in the series of Greek coins than almost any other in Europe, a valuable museum of antiquities from Herculeanum and Pompeii, collected in Italy by the uncle of the present prince, and a library of 30,000 volumes, besides some very rare MSS. The surrounding country is well-wooded, and there is a handsome avenue of six rows of antient oaks, 2000 paces in length, close upon the town. Stein states the latitude to be 51° 25' 17" N.

AROMA is the supposed principle of odour in plants, formerly called by Boerhaave *Spiritus Rector*. This quality generally resides in the essential oil; but there are some vegetables that have a strong odour which yield but little or no essential oil, as the jessamine and the violet; or when an oil in small quantity is procured from them, it has not the powerful smell which, considering the smallness of its proportion compared with the fragrance of the plants, it might be expected to possess. As plants exhale their odour when exposed to the air, and communicate it to water at a lower temperature than that at which it could be distilled, it has been imagined that some principle of a more subtle nature exists, in which the odour resides, and that it is this which imparts smell to the oil. In fact, however, the property of odour belongs to proximate vegetable principles of different kinds, in which there is no reason to suppose the existence of any common principle; essential oil is unquestionably the most usual cause of its production, and it is capable of being volatilized in small quantity at a low temperature, and thus diffused through the atmosphere or communicated to water.

AROMATARI, JOSEPH OF, a learned physician and naturalist, was born about the year 1586 at Aasisi, a town of the duchy of Spoleto, in the ecclesiastical states. His father was a physician, and was competent to determine, as well as eager to bestow on his son, the kind of education most suited to fit him for the same profession. His studies were begun at Perugia, and continued at Padua, where he studied successively logic, philosophy, and medicine. He

obtained his degree of doctor of medicine in his eighteenth year, and immediately afterwards established himself as a physician at Venice, where he remained practising for fifty years; nor could he be prevailed upon to quit it by the most tempting offers and solicitations made to him by the Duke of Mantua, the King of England, and Pope Urban VIII. He died at Venice on the 16th of July, 1660.

During this long period he devoted himself to his profession, to the study of the mode of generation or re-production of plants and animals, and to polite literature. He accumulated an immense library, extremely rich in manuscripts. His only publication connected with polite literature was, *Riposte alle Considerazioni di Alessandro Tassoni sopra le Rime del Petrarca*. Padua, 1611, 8vo. To which Tassoni having replied under the assumed name of Crescenzo Pepe, Aromatari answered under a fictitious name, in the following work: *Dialoghi di Falcidio Melampodio in risposta agli Avvertimenti dati sotto nome di Crescenzo Pepe a Giuseppe degli Aromatari*. Venice, 1613, 8vo. His contributions to medicine and natural history consist in *Disputatio de Rabie Contagiosa, cui preposita est Epistola de Generatione Plantarum ex Seminibus*. Venice, 1625; and Frankfort, 1626, 4to. The Epistle has been repeatedly reprinted; 1st, in *Epistolæ Selectæ* of Richt, Nuremberg, 1662; 2nd, in the *Philosophical Transactions*, vol. xviii. p. 150. Lond. 1694; and at the end of Jungius's *Opuscula Botanico-Physica*, at Saxe-Cobourg, in 1747.

This Epistle, addressed to Dr. Bartholomew Nant, gave only the outline, or heads of chapters, of a large work which he intended to write on generation, but which his numerous professional engagements and delicate health prevented his accomplishing. The views, however imperfectly developed, are more in accordance with those held in the present day by our most distinguished vegetable anatomists and physiologists, than many of those entertained for a long period subsequent to the time in which he lived. He taught that the so-called seeds of plants were not, as a whole, the new plant, but that a very small portion of a seed possessed the principle of life, the rest being intended for the nourishment of this part. This corresponds to the embryo and albumen of modern writers. The existence of this embryo in a seed rendered it fertile; its absence caused it to be unfertile. The development of this embryo took place in a two-fold direction, a portion of it ascending, and constituting the *plumule*, the other descending, and constituting the *radicle*.

He asserted the analogy between seeds and the eggs of animals, and even designated seeds the *eggs of plants* both in the early stages of their growth receive their nourishment from the albumen by which they are surrounded, but afterwards the chicken takes up its nourishment by its mouth, a plant by its roots. In both cases the young embryo existed previous to hatching or germination, being by these processes only developed, and not then formed.

His principles respecting the generation of animals were known to, and adopted, and promulgated at full length by Harvey in his treatise *De Generatione*. His views respecting seeds would appear to have been overlooked, except by a very few. It is right, therefore, that the well-founded claims of this learned physician should be brought fairly and distinctly forward.

AROMATICS are agents obtained from the vegetable kingdom, exercising a peculiar influence over the digestive powers, and possessed of more or less odour or fragrance. Of this odour, by which they can at all times be recognized, the most usual vehicle is an essential or volatile oil, as stated in the article AROMA. Indeed volatile oil exists in all aromatic plants, and in every part except the cotyledons, save in the nutmeg and a very few other seeds; but this aromatic oil does not reside in the same part in every kind of plant. In umbelliferous plants we find it mostly in the fruits (and chiefly in the *vittæ* of them), yet in angelica, celery, and parsley, it is diffused through the whole structure. Labiate plants, such as mint, balm, rosemary, and lavender, have it in the leaves and stem; cinnamon in the bark; all terebinthinate plants in their young branches. The iris florentina (*orris*) and others have it chiefly in the root, the scitamineæ equally in the root (ginger) and the seeds (cardamoms): the rose and chamomile have it in the petals; yet it is not equal in all the petals of the chamomile, being greatest in the yellow florets of the disk; hence, doubling the flowers of the chamomile, by which the yellow florets of the disk are diminished, and the white florets of the ray increased, lessens the virtues of the flowers.

The power of medicines is frequently judged of by their sensible qualities, that is, by the impression which they make on the organs of smell and taste, aromatics affect both of these senses in a very perceptible and sometimes extraordinary manner. Scarcely any one is insensible to the odour of particular flowers, and some are affected by them to an extraordinary degree. The approach to Ceylon can be determined by the fragrance of the air, at the distance of many miles; the *magnolia glauca* (beaver-tree or swamp magnolia) diffuses an odour, by which it can be recognized at the distance of three miles, among the swampy districts, and consequently moist atmosphere, in which it grows. This powerfully affects many persons while travelling or hunting; and the magnolia tripetala causes sickness, headach, and an aggravation of fevers or rheumatism, among those near it who are labouring under these complaints. The odour of the jonquils and other fragrant plants raised in Holland is so great, when brought into a room or close apartment, as to be quite overpowering. In such countries or places as have a very humid atmosphere, the odour of plants is most readily diffused as well as most potent; of this we may satisfy ourselves by calling to mind the greater fragrance of flowers early in the morning, in the evening, or after a shower. This accounts for the violent action of the plants in the countries just mentioned; but even many plants of Britain affect some individuals, endowed with a peculiar and excessive sensibility, to an extreme degree. The sweet-scented violet has such an effect on certain persons as to occasion headach, convulsions, and apoplexy. (See Triller, *Dissertatio de Morte Subita ex nimio Violarum Odore.*)

Aromatics are seldom applied to the organ of smell for the purpose of influencing the system in a remedial manner, except in the form of aromatic vinegar, in threatened or actual fainting: we shall therefore proceed to consider their action upon the palate and stomach. As all aromatics contain volatile oil, their action is generally referred to this principle; but there cannot be a doubt that the more fixed principles which they contain contribute greatly to their effect. Volatile oils, when separated, act chiefly on the nervous system; but aromatics influence more particularly the digestive organs, the function of assimilation, and the generation of animal heat. They are themselves digested, but previous to this process commencing, or going any length, they produce, by direct contact with the internal surfaces, a peculiar effect, which we perceive beginning at the lips and palate, and accompanying them in their progress to the stomach. They scarcely excite any general action of the system, but expend their power chiefly upon the stomach, and, in a less degree, upon the intestinal canal; increasing the vital force of the former, and quickening the muscular action of the latter. They also communicate to the stomach a greater power of resistance to unpleasant sensations, as under their influence many articles can be borne by it which would otherwise be rejected; and this happens equally with regard to food and medicines.

The mixture of aromatics renders them more agreeable than when given singly; and this is exemplified both in their medical and culinary employment, as no good cook will use only one spice if she can procure more. The *aromatic powder* and *aromatic confection* are compounded on this principle for medical use, and Dr. Kitchener's Zest for culinary purposes.

The necessity for the employment of aromatics is greater in warm climates and weather than in cold; and we find the plants which furnish them grow in the greatest abundance in hot countries. The pepper tribe (piperaceæ), for example, is confined to the hottest parts of the world; such as tropical America and the Indian Archipelago; forty species of pepper are met with in the island of Java alone. Throughout the East Indies the natives restore the powers of the stomach by chewing betel, which consists of slices of the areca nut, sprinkled with fresh lime, wrapped up along with some other aromatic in a leaf of the *piper betel*. The Indians of South America use the *erythroxylum Peruvianum* (called *cacca*) along with the leaves of the *chenopodium Quinoa*, mixed with quick-lime, to stimulate the impaired powers of the stomach during their long and toilsome journeys over the heights of the Andes. (See Humboldt, *Tableau Physique de la Nouvelle Espagne.*) On the same principle, the Europeans who visit tropical countries use curry and other hot dishes. But in every quarter of the globe we find condiments used along with all articles difficult

of digestion, especially vegetables, fish, and young meats, such as veal. Aromatics are therefore employed both to prevent and cure diseased states of the stomach, and to assist the action of other remedies.

In simple loss of appetite, without any other obvious disease, or in slow digestion, they may be employed in the form of the warmer pickles during dinner, or preserved ginger after dinner.

In many cases of fever in warm climates, the stomach is so powerless that it cannot extract from cinchona bark, or other febrifuge medicines, the principles fitted to cure the disease, unless aided by aromatics. Hence Cayenne pepper is added to them; and indeed Cayenne pepper will often cure the fever without any bark. Lately piperin (the active principle of pepper) has been recommended as a means of curing fevers in Europe; and certain it is that some lingering fevers, of the intermittent character, occurring in old or feeble persons, cannot be cured without the assistance of aromatics. [See AGUE.] It may be stated, however, that piperin when pure has no aromatic property.

The preparation of iron (carbonate) which is found to be so useful in curing tic-douloureux, can rarely be borne by the stomach for such a length of time, or in such large doses, as are necessary, without adding aromatics to it. They are also very beneficially added to aloëtic purgatives, for the treatment of indigestion and constipation, occurring in literary and sedentary persons. Aromatics are frequently used to disguise the unpleasant taste of many medicines. The disagreeable taste of aloes is concealed by adding the aromatic or compound spirit of lavender, and the intensely bitter taste of the sulphate of quinia is nearly covered by mixing one part of it with ten or fifteen parts of powdered valerian, fennel, aniseed, or orange-peel.

Aromatics are most suited to persons of a phlegmatic constitution, or those advanced in life; less so to the young, or those of very irritable constitutions. They are to be altogether prohibited in certain states of the stomach, or system generally. When there exists any inflammatory condition of the stomach, they would be very improper. And it is necessary to observe, that in all degrees and stages of inflammation of the stomach, debility more or less is felt by the patient, which might seem to indicate their use; but under such circumstances they are extremely hurtful. The same observations apply to the aromatic teas, such as balm and sage, in common use among the people.

In certain affections of the brain, such as when there is a tendency to apoplexy, they are improper. Cullen mentions the case of a gentleman, who having taken by mistake two drachms of powdered nutmeg, in about an hour became drowsy, and fell from his chair. Being laid in bed, he dropped asleep, but awoke from time to time, and was quite delirious. He thus continued alternately sleeping and delirious for several hours: even the following day he still complained of headach and drowsiness. In the East such cases are of frequent occurrence. Persons predisposed to affections of the brain should abstain from such articles, especially mulled wine at bed-time.

ARONA, a town of Piedmont, in the division of Novara, on the western shore of the Lago Maggiore, and near its southern extremity. It stands on the Simplon road from Switzerland to Milan, from which another post-road branches out at Arona, leading to Novara, Vercelli, and Turin. Diligences and mails are established on both roads. Arona is seven miles from Sesto Calende, which is the frontier town of Austrian Lombardy, on that side. The river Ticino forms the boundary between the Austrian and the Sardinian States. Arona is a neat and bustling little town, with a small harbour on the lake; it carries on a considerable transit trade between Piedmont and Switzerland. Goods coming from Genoa and Turin are embarked at Arona, and sent across the lake to the Swiss canton of Ticino, from whence they pass by the new road over Mount Bernardin into the Grisons, and thence into Germany. The population of Arona is between two and three thousand inhabitants. Its situation is delightful, just within the last range of hills above which the snowy Alps are seen towering, and at the opening of the wide plains of Lombardy. The country near Arona produces good wine. S. Charles Borromeo, the celebrated archbishop of Milan, was born in the castle adjoining Arona, which is now in ruins. An enormous colossal statue was raised to him, on a hill above the town, in 1697. It is sixty-six feet high, and stands on a granite pedestal, forty-six feet in height, and is a conspi-

enous object for miles around. The head, hands, and feet, are cast, the body is made of large stones, and is covered with sheets of hammered copper. (Bertolotti, *Viaggio da Milano a Ginevra*.) The proportions of the statue are very good. The Saint appears holding his breviary under his left arm; the right is extended, in the act of bestowing his benediction on the country. A staircase is made through the inside of the colossus leading into the head of the statue. Arona lies thirty-six miles N.W. of Milan, in 45° 47' N. lat. and 8° 28' E. long.

ARPEGGIO, in music (Ital. *to play on the harp*), is, when applied to keyed instruments, the striking the notes of a chord in rapid succession, as in the manner of touching the harp, instead of playing them simultaneously, the notes, when struck, being held out the full remainder of the time. Example—

This spot was signalized by the battle fought here on St. Matthew's day, September 21, 1589, between the army of Henry IV. of France and that of the League under the Duke of Mayenne. The engagement was not remarkable either for its fierceness or for the heavy loss sustained by the defeated party; but Henry's success at so critical a period was of the greatest importance to him, and perhaps he might ascribe his subsequent settlement on the throne in no small degree to the victory at Arques.

ARRACACIA is a genus of umbelliferous plants which comprehends a species of as much importance in the tropical parts of America as the parsnip and carrot are in Europe. This plant, the *Arracacia esculenta* of botanists, is cultivated in great quantities in the neighbourhood of Santa Fé de Bogota, in the cooler districts among the mountains, and in other parts of the state of Colombia, where it is called Arracacha. It resembles the common hemlock in appearance, but the leaves are much broader, the stems are not spotted, and the flowers are of a dingy purple colour; it is also of smaller stature.

The root is of the same nature as the tuber of a potato, only it is forked, or divided into several lobes, each of which is about the size of a large carrot. These, when fit for eating, are boiled like the potato, and become of a firm but tender consistence, not at all mealy, and have a flavour intermediate between a chestnut and a parsnip. It appears that an immense produce of arracacha is obtained in the South American provinces, where it has long been as much the staple nutriment of the population as the potato or the yam in other places; and as it will only thrive in the colder districts, it was once expected to form an important agricultural plant in Europe. It has, however, been found upon trial unable to accommodate itself to our uncertain climate, and to perish as soon as the cold nights and damp weather of autumn approach, without having been able during the summer to perfect its tubers. It is therefore only cultivated now in botanical collections. For an excellent

account of this plant, see Hooker, in *Botanical Magazine* tab. 3092.

ARRACK. [See **ARACK.**]

ARRAGON. [See **ARAGON.**]

ARRAGONITE, called by Mohs the prismatic lime-haloide, is a mineral substance, admitting of cleavage in planes parallel to the faces of a right rhombic prism of $116^{\circ} 5'$ and $63^{\circ} 55'$, which may therefore be considered as its fundamental form (fig. 1). The most general modifications which occur, consist either in the removal of the four acute angles at A by planes *a* intersecting each other in the short diagonal B B, and inclined to each other at an angle of $108^{\circ} 18'$, by which the face P being entirely removed, the form of fig. 2 is produced; or the change may be effected by the truncation of the acute lateral edges of the prism by planes parallel to the axis of the crystal, and therefore inclined to the faces, L, at $121^{\circ} 57'$, giving rise to the form seen in fig. 3. These modified forms usually present themselves in twin crystals, in which the short diagonals of the prism B B are placed at right angles to one another, when only two crystals are present, thus producing a very simple cross. It is usual, however, that three of the crystals of fig. 3 cross each other, producing a crystal of the appearance of fig. 4, which, at first sight, may be mistaken for an hexagonal prism, but on a closer inspection it will be found that what appeared to be a single face, is really composed of two planes, making a re-entrant angle.

The intersections of the individual crystals with each other are visible both in the lateral and terminal faces, and are indicated in fig. 4 by the dotted lines. These crystals have been found abundantly in a ferruginous clay in Aragon in Spain, where they occur accompanied by sulphate of lime. From this circumstance the mineral has derived its name. It has also been found very beautifully crystallized in a vein of a massive variety of the same mineral traversing basalt at Bilin in Bohemia. (Mohs.) Fine specimens have been found at the following places in England—in the Dufton lead-mines; in a cavern of grauwacke near Merridge, Somersetshire; and also in several parts of Devonshire, &c

Arracacha.

1. A barren flower; 2. a fertile flower; 3. a stamen; 4. a petal; 5. a ripe fruit; 6. the same cut across.

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

In an old coal-mine six miles south-west of Cockfield, Durham, it is remarkable as occurring depending from a roof of claystone and accompanied by tubular calcareous stalactites. (Phillips.) Varieties of this mineral are also common in beds of iron-ore in the mines of Eisenerz in Styria, and in several other iron-mines of Hungary, of Transylvania, &c., consisting of numerous fibrous crystals, of a satin-like lustre, radiating from a centre, and to these the name of *flos ferri* has been applied.

In a chemical and crystallographical point of view, Arragonite is peculiarly interesting, as presenting to us carbonate of lime differing in its system of crystallization from that of the common Calc-spar, and thus affording us an instance of the influence of any difference in the aggregation of matter in changing its physical properties, as will be seen by comparing this substance with the rhombohedral Calc-spar, with which it agrees in chemical constitution. In the scale of Mohs, its hardness (see **HARDNESS**) varies from 3.5 to 4, while that of Calc-spar is 3. The specific gravity of

Arragonite is	2.931
Calc-spar	2.721

They act also differently on light, the index of ordinary refraction of

Arragonite being	1.693
Calc-spar	1.519

Attempts have been made to account for these differences by considering them the effects of small quantities of carbonate of strontia, which Professor Stromeyer first discovered to be contained in many specimens of Arragonite; but the conclusion is unfounded, as will be seen by the results of two analyses given by Stromeyer.

	First.	Second.
Carbonate of lime . . .	95.2965	99.2922
Carbonate of strontia . .	0.5090	4.1043
Water	0.1544	0.5992

where the carbonate of strontia is in small and varying proportion, and must therefore be considered as an accidental impurity.

ARRAIGNMENT. This word is derived by Sir Matthew Hale from *arraisonner*, *ad rationem ponere*, to call to account or answer, which, in ancient law French, would be *ad-resoner*, or, abbreviated, *a-resner*. Conformably to this etymology, arraignment means nothing more than calling a person accused to the bar of a court of criminal judicature to answer formally to a charge made against him. The whole proceeding at present consists in calling upon the prisoner by his name, reading over to him the indictment upon which he is charged, and demanding of him whether he is guilty or not guilty. Until very lately, if the person accused pleaded that he was not guilty, he was asked how he would be tried; to which question the usual answer was, 'By God and my country.' But by a late statute (7 and 8 Geo. IV. c. 28. sec. 1) this useless form was abolished; and it was enacted, that 'if any person, not having privilege of peerage, being arraigned upon an indictment for treason, felony, or piracy, shall plead "Not guilty," he shall, without any further form, be deemed to have put himself upon the country for trial, and the court shall, in the usual manner, order a jury for the trial of such person accordingly.'

The arraignment of a prisoner is founded upon the plain principle of justice, that an accused person should be called upon for his answer to a charge before he is tried or punished for it. That this was a necessary form in English criminal law at a very early period appears from the reversal in parliament of the judgment given against the Mortimers in the reign of Edward II., which Sir Matthew Hale calls an 'excellent record.' One of the errors assigned in that judgment, and upon which its reversal was founded, was as follows: 'that if in this realm any subject of the king hath offended against the king or any other person, by reason of which offence he may lose life or limb, and be thereupon brought before the justices for judgment, he ought to be called to account (*poni rationi*), and his answers to the charge to be heard before proceeding to judgment against him; whereas in this record and proceedings it is contained that the prisoners were adjudged to be drawn and hanged, without having been arraigned (*arrenati*) thereupon, or having an opportunity of answering to the charges made against them, contrary to the law and custom of this realm.' (Hale's *Pleas of the Crown*, book ii. c. 28.)

The ceremony of the prisoner holding up his hand upon arraignment is merely adopted for the purpose of pointing out to the court the person who is called upon to plead. As it is usual to place several prisoners at the bar at the same time, it is obviously a convenient mode of directing the eyes of the court to the individual who is addressed by the officer. In the case of Lord Stafford, who was tried for high treason in 1680, on the charge of being concerned in the Popish plot, the prisoner objected, in arrest of judgment, that he had not been called on to hold up his hand on his arraignment; but the judges declared the omission of this form to be no objection to the validity of the trial. (Howell's *State Trials*, vol. vii. p. 1555.)

ARRAN, an island of Scotland, forming part of the shire of Bute. It lies in the bay formed by the peninsula of Cantire [see *ARVLE*] and the Ayrshire coast; and is separated from the former by the sound of Kilbrannan, and from the latter by the Firth of Clyde. The distance between the nearest points of Arran and of the island of Bute is above five miles; and from the nearest point in Arran to Skipnish Point in Cantire is about four. From the Ayr-

shire coast the least distance of the island is about eleven miles. (*Map of Scotland*, published by the Society for the Diffusion of Useful Knowledge.) The greatest length, measured from near Loch Ranza in the N.N.W. to Kildonan in the S.S.E., is more than twenty miles, and the greatest breadth from Drumodune Point to the headland between Brodick and Lamlash bays, about twelve*. The coast is less broken by lochs than that of most of the Hebrides. Loch Ranza on the north side, and on the east the bays of Brodick and Lamlash, are the chief inlets. Lamlash Bay is sheltered by Lamlash or Holy Island, which lies across the entrance, and is nearly two miles long from north to south, with an average breadth of half a mile. The cliffs of Lamlash Island are chiefly basalt, in rude columns, resting on sandstone, and some parts of the island rise to the height of above 1000 feet. The harbour thus enclosed has good holding-ground, sufficient depth for the largest vessels, and room enough for the largest navy to ride at anchor. Brodick Bay is a little to the north of Lamlash Bay (from which it is separated by a headland), and is of an irregular shape, having on the north side an old ruinous castle (Arran Castle) inhabited occasionally by the duke of Hamilton. Behind this castle rises Goatfell, the highest eminence in the island. The bay affords good anchorage-ground and has about five fathoms water; but it is only in moderate weather that vessels can ride in safety. Loch Ranza extends perhaps a mile inland, and has three fathoms water even at the lowest ebb. The approach to the island at this point is striking; at the extremity of a small point of land jutting into the loch are the ruins of a castle of some magnificence, said to have been inhabited by the kings of Scotland when they came to hunt in Arran; beyond is a little plain, or glen, embosomed in hills, watered by a stream, and inhabited by the people of a small village. Besides the island of Lamlash already mentioned, another small island, called Pladda, lies off the south coast of Arran, about a mile distant; it is low and flat, about a mile long, with ten acres of excellent pasture. There is a lighthouse upon it.

The surface of Arran is in general high, particularly towards the north end, where the scenery is terrific and sublime. The mountains here present peaked summits, and are arranged in groups. Goatfell, the highest, is estimated by Professor Playfair to be 2945 feet high; but in the Society's *Map of Scotland* it is marked at 955 yards or 2865 feet; which is also Dr. Macculloch's statement. The lower part of the mountain is composed of red sandstone, but after an ascent of several hundred feet, mica-slate, separated from it by a bed of breccia, rises from under it, and continues till it reaches a kind of irregular plain, from which arises a mass of granite, different from that of the central highlands, in the form of an obtuse pyramid. The side of the mountain is covered with debris of mica-slate and granite, and towards the summit by large blocks of granite, which materially impede the ascent, and the rude appearance of which is increased by the absence of all vegetation, excepting a few lichens. The view from the summit is very extensive, comprehending the south part of Arran, the island of Bute and the Cumbray islands, backed by the mainland of Scotland; the peninsula of Cantire; the mountains of the far-distant Isla, Jura, and Mull; and the coast of Ireland from Fairhead to Belfast Lough. The name of this mountain in Gaelic is *Gaoth Bhein*, 'Mountain of Winds.' The name of Goatfell has been given by the strangers who have visited the island. It is sometimes incorrectly called Goatfield.

The geology of Arran, from its interesting character, has attracted much attention. The prevailing line of the coast is low, although it occasionally rises into precipitous cliffs. Red sandstone is the predominant rock, extending with little interruption from near Loch Ranza on the north side of the island, along the eastern and southern shore, to Slid dery water, near the S.W. extremity of the island. From hence it occurs alternating with claystone and porphyry to Drumodune; and extends, with one interruption, from Drumodune to the river Iorsa, where it finally disappears. Schistose rocks, mica-slate on the west and clay-slate on the north coast, occupy the remainder of the circuit to the point where the sandstone commences.

* It is surprising to observe the difference in the statements given by different writers of the dimensions of this island, an integral part of Great Britain, and a place which, from its geological features, has attracted much notice. The measurements given above are from the Society's Map of Scotland. In Headrick's *View of the Mineralogy, &c. of Arran*, the length is given at 34 or 35 miles and the breadth at from 15 to 20. Jamieson's *Outline of the Mineralogy of the Shetland Islands and of the Island of Arran*, gives 28 miles and 12

The interior of the island may be mineralogically divided into two parts, separated from each other by an irregular line drawn from Brodick Bay to the mouth of the river Iorsa. North of this line, mica-slate, clay-slate, and granite occur. The schistose rocks rise from beneath the sandstone on the eastern coast, and form, as already noticed, the western coast north of the Iorsa. The centre is occupied by the granite, which forms the lofty and craggy mountains of Goatfell and Kidvoo towards the east; of Caim-na-Caillich, Ben Huish, and Ben Breach, in the centre; and Ben Vearau on the west. The granite approaches the sea so nearly on each side as to reduce the space occupied by the clay-slate and red sandstone on the east, and the mica-slate on the west, to narrow belts. The granite rises into spiry forms, frequently bare of vegetation, and is intersected by deep and rugged hollows, through which mountain-torrents, almost perennial, take their course.

The districts occupied by the different kinds of rock in the southern division of the interior are not so easily determined, owing to the nature of the rocks themselves, and the accumulation of soil on the surface, which renders it difficult to ascertain or lay down their position with any accuracy. All those which are not sandstone are varieties of trap, syenite, porphyry, and other unstratified rocks of the same family, overlying the sandstone. Veins of claystone, clinkstone, or porphyry, traverse the sandstone, and even in some places the granite. (M'Culloch's *Description of the Western Islands of Scotland*.)

The island, from its small dimensions, cannot be supposed to have any extensive lake or important river. Loch Tana or Tannoch or Tanadh (the length of which is vaguely estimated at a mile or a mile and a half, and its breadth at a quarter or half a mile) is several hundred feet above the level of the sea. A small stream, the Iorsa (pronounced Eersa), flows from it into Machry Bay on the west coast. Other rivulets, some of them forming cascades, flow from the hills and through the deep glens into the sea. These are more numerous and more permanent than the size of the island and their character of mountain-torrents would lead us to expect. One, bursting from an orifice in the Dipping Rocks, which are rudely columnar basaltic cliffs about 300 feet high, near the south-east corner of the island, falls into the sea at some distance from the base of the rocks.

At Cory or Corry, on the north-east coast, are quarries of sandstone of a beautiful white colour, well suited for building. The stone from them was used in the construction of the Crinan Canal. [See ARGYLESKIRE.] Slates were once procured near 'the Cock of Arran' (an enormous mass of sandstone lying loose on the north shore of the island, and forming a well-known sea-mark), and some vain attempts to work coal were made many years ago in the same neighbourhood, and also near the bay of Lamash. Transparent stones, known to the jewellers as Arran stones, Cairngorms, and Scotch topazes, are found on Goatfell.

The climate of Arran is temperate. There is no sultry heat in summer, and the snow-storms in winter are not heavy. Snow lies long on the granite mountains, but only a few hours on the lower lands, and on the sea-shore it is speedily dissolved. The height of the mountains and the position of the island render it very subject to rain.

The island was originally a royal domain mostly clothed with wood; stocked with roes, red-deer, wild-boars, and other animals of the chase, and used much by the kings for hunting. Marks of the ancient woods still remain, and extensive coppices of birch, ash, and oak, spring up amidst the cliffs. The earliest creations of private property were in favour of monastic establishments, from which, upon the dissolution of the religious houses, the lands came to the dukes of Hamilton as chiefs of the island, and have continued ever since in that family, by which the greater portion of the island is still possessed. The land which admits of cultivation is not fertile, and is of small extent compared with the surface of the island. Oats, bear or big, potatoes, peas, and beans, are grown. Till of late years the farmers were in a wretchedly depressed condition, owing to the nature of the tenure of land, and the consequent bad methods of farming.

The native breed of horses is small, patient of hunger and fatigue, and remarkably sure-footed. Horses of a larger size are imported from Argyleshire. Hogs were only introduced about 1770. Of wild animals the island produces hares and rabbits: Mr. Pennant, in his *Tour to the Hebrides*, adds the otter and wild cat. The birds are blackcocks, grouse,

ptarmigans, plovers, &c. The red-deer and wild goat, formerly abundant, are now nearly if not quite extinct. The eagle and other birds of prey have been nearly extirpated, from the care taken to preserve the game. Serpents, including the common adder, and toads, are found in Arran.

Kelp, till of late, was made in considerable quantity. Most of the woollen cloth used in the island is made by the women. The herring fishery is the only one in which the natives engage. Shoals of these fish often frequent the coast, or the fishermen repair to Loch Fyne [see ARGYLESKIRE], or other places. The basking shark or sail-fish is occasionally taken: they are sometimes near forty feet in length, and yield a good quantity of oil. The roads in the island owe their origin to Ann, duchess of Hamilton, in the seventeenth century, and little seems to have been done from her time till about twenty years since, when roads were made, partly at the expense of government, from Lamash to Brodick Bay, and from the last to Blackwater on the south-west coast.

The population of Arran, which contains two parishes, Kilmorey and Kilbride, was, in 1831, 6427. It had rather declined during the preceding ten years. Most of the people understand English, though the spoken language is Gaelic. Arran, the island of Bute, and the Cumbray islands, make up the shire of Bute. It is in the presbytery of Cantire and the synod of Argyle. Brodick is the principal village.

This island was early subdued by the Norwegians, and it afterwards formed part of the domains of the Lords of the Isles, vassals of the Scotch king. It subsequently formed an earldom, which was held successively by the families of Boyd and Hamilton, and it was not till the reign of James V. (in the sixteenth century) that it was really reduced to obedience to the Scottish crown. It afforded a temporary asylum to Robert Bruce in his adversity, and there is a cave on the west side of the island in which he sought refuge.

Immense cairns, rough obelisks, monumental stones, and other antiquities, supposed to be Druidical, are found in different parts. There are two or three Danish forts, and the remains of a mound of doubtful origin at Drummoduin, or Drumodune, on the west side. On Lamash island are some vestiges of a religious house. Besides Arran Castle and Loch Ranza Castle, there are the ruins of another old castle (Kildonan) on the south coast. A garrison of eighty men, which had been placed in Arran Castle by Oliver Cromwell, having provoked the indignation of the islanders, was massacred by them. (Headrick's *View of the Mineralogy, &c. of Arran*; Jameson's *Outline of the Mineralogy of the Shetland Islands and the Island of Arran*; Pennant's *Voyage to the Hebrides*; *Transactions of the Geological Society*, &c.; Macculloch's *Highlands and Islands of Scotland*.)

ARRAN, ISLES OF, a cluster at the entrance of Galway Bay on the west coast of Ireland, sometimes called the South Isles of Arran, to distinguish them from the island of Arranmore off the coast of Donegal, which is sometimes called North Arran.

These islands are three in number, lying in a line N.W. and S.E.; Arranmore, the largest, being to the N.W., that of Inismain next to it, and then that of Inishere. Arranmore is between six and seven English miles long, and about two miles across in the broadest part. The N.E. coast of these islands presents a sloping shingly beach; the opposite side has fine romantic cliffs, abounding with puffins, on whose eggs, in time of scarcity, the inhabitants subsist. They contain about 7000 acres, are very fertile, and produce a small kind of oat without any husk. The stoutest calves in the county of Galway (in which these islands are included) are reared here.

Each island is an ecclesiastical parish, and forms part of the extensive union of Ballinakill in the archdiocese of Tuam. The population, in the year 1821, was 3079. Many, or indeed most, of the inhabitants are engaged in fishing, and use a *corragh*, or boat made of a frame-work of willow covered with tarred linen, and provided with a rudder. In these rude vessels three or four hardy sailors embark, and trust themselves out far from the shore. A pier, nearly 245 feet long, and a landing quay, 326 feet in extent, have been erected under the direction of the late board of commissioners for the Irish fisheries, at Killeeny, in Arranmore, the largest village in this group of islands, which has a population of 974 persons. This has caused an extension of the number and an improvement in the class of the fishing vessels. A number of vessels rendezvous here during

the herring season. The number of pupils at school in the year 1821 in these islands was 214, viz. 161 boys and 53 girls.

Arranmore was also called *Arran a Noim* or *Arran Naomh*, i.e. 'Arran of the Saints,' a number of churches having been erected in it, in which the bodies of many Irish saints repose. It is said that there were antiently on this island ten churches, and five on the two smaller ones. On a high cliff in Arranmore, over the sea, is Dun-Angus, a large circle of huge stones, formed without cement, and capable of holding two hundred cows. A Franciscan friary was founded on one of these islands in 1485.

The inhabitants long retained, and perhaps still retain, the persuasion, that, on a clear day, they can see from this coast *Hy Brasil*, or the Enchanted Island, the paradise of the pagan Irish.

In 1334, these islands, with the neighbouring island of Boffin, were plundered by Sir John D'Arcy, Lord Justice of Ireland. They give the title of earl to the family of Gore. (Seward's *Topographia Hibernica*; *Letters from the Irish Highlands, &c.*)

ARRAS, a strong and important town in France; the capital formerly of the province of Artois, and now of the department of Pas-de-Calais. It is on the south bank of the river Scarpe, 108 miles N. by E. of Paris through Senlis and Peronne, or 113 miles through Beauvais and Amiens. 50° 17' N. lat., 2° 45' E. long.

Arras may be regarded as consisting of three parts. The *Cité*, or what may be termed the old town; the *Ville*, or the new town; and the Citadel, which was erected by Vauban, and is one of the strongest in this part of France. Modern authorities separate the town into upper and lower, but it is not clear whether these divisions correspond respectively to the *Cité* and *Ville* of older writers, though it is probable they do. The *Cité* and *Ville* were formerly separated by a ditch and wall; there was also between them a narrow valley, through which the little stream, the *Crinchon*, flowed. The handsome stone houses and large *places* (squares) of Arras entitle it to rank among the finest cities in France, as far at least as regards the lower town, which is comparatively of modern erection. The cathedral, a Gothic edifice in a bold style of architecture; the town-hall, another Gothic building; and extensive barracks, contribute to adorn the city. The *Petite Place*, of which the town-hall forms one side, is surrounded with a colonnade, as well as the *Grande Place*. In some of the highest spots in the city, chalk-pits have been excavated, some of the hollows of which serve as wine-cellars. Part of the surrounding country can be laid under water in case of need.

Arras appears in the Roman writers under the name of Nemetacum, but it afterwards took that of Atrebatas, from the people who possessed the town with the surrounding territory. From this name Atrebatas, both the town (Arras) and the country (Artois) receive their designation. It appears from the writings of St. Jerome, who lived during the close of the fourth century and the beginning of the fifth, that in his time it was a manufacturing town, and had been pillaged by the barbarians.

When the Franks first established themselves in the N.E. part of France, Arras formed part of their dominions; and, by the earlier kings of France, the lordship of the town was placed in the hands of the bishops of Arras, who retained it till the time of the Emperor Charles V., notwithstanding the power of the dukes of Burgundy, who were counts of Artois. Charles V., having compelled the kings of France to give up the right of sovereignty over that part of the Burgundian dominions which had come to him by inheritance, made them yield at the same time the city of Arras, which he then subjected to the temporal power. It came again under the dominion of France by the treaty of the Pyrenees, in 1659; and the bishops seem to have been re-established in their seigniorial rights. The magistrates of the *Cité* were still nominated by them in the early part of the eighteenth century.

Arras is the see of a bishop, whose diocese comprehends the department of Pas-de-Calais. The population, in 1826, was about 22,000. The Scarpe is navigable from this town; the trade consists both in the agricultural produce of the neighbourhood and in the manufactures of Arras itself, which are cottons and woollens, lace, soap, and beet-root sugar. There are also many oil-mills.

Among the literary and scientific institutions are the High

School, the Royal School of Fortification and Military Engineering (*École Royale du Génie*), the Drawing School, the Deaf and Dumb School, the Secondary School of Medicine, the Societies of Agriculture, Commerce, Science, and Arts, a public library of 34,000 volumes, a collection of paintings and antiquities, and a botanical garden.

Arras was the birth-place of Francis Baudouin, a writer of repute on politics, law, history, and divinity, who died in 1573; and of the two Robespierres and Joseph Lebon, of revolutionary notoriety. (Balbi; Malte-Brun; Martinière *Dict. Universel de la France*.)

Two treaties were concluded at Arras in the fifteenth century: one in 1435, between France and Burgundy, by which several towns were annexed to the latter; and one in 1482, between Maximilian of Austria and Louis XI. of France, whereby Margaret, daughter of Maximilian, was to have been given to the dauphin, with Artois and Burgundy, as a dowry.

The arrondissement of Arras contains 219 communes, and 143,615 inhabitants.

ARREOY, a remarkable institution, which formerly subsisted in Otaheite, and the other islands of the Society group. The first notice of the existence of this institution was brought to Europe by Cook, on his return from his first voyage in 1771. The account given in the narrative of the voyage published the following year was however generally supposed to have received a colouring from the florid pen of Hawkesworth, by whom the book was written. In the narrative of his second voyage, which he wrote himself, Cook appears inclined to soften down certain of the features of the former representation. Subsequent statements were given by Dr. Forster and others, for the most part differing from each other in important particulars. The fullest account, we believe, that has appeared, and at the same time the latest, is that given in Ellis's *Polynesian Researches*, vol. i. pp. 311-344.

Hawkesworth's account would lead us to suppose that the distinguishing characteristic of the Arroy societies was, a community of women among the members. Upon this point it appears clearly that he was mistaken. Forster thinks that a rigid celibacy was the original law of the institution; and this notion receives considerable countenance from the mythological tradition of its origin which is given by Mr. Ellis. To the last, according to Ellis, each member continued to have his own wife, who was watched with extreme jealousy. It is certain, however, that these societies sanctioned and encouraged the greatest licentiousness of manners.

It is now understood that the fundamental law of the Arroy institution was that no children born to any of the members should be suffered to live. Even upon this head, however, there is a great deal of contradiction in the various accounts, and the information we have is upon the whole very unsatisfactory. Forster states that it was a rare thing for a child ever to be born to a member of the Arroy, and that consequently infanticide was very seldom resorted to. They chose their wives, he intimates, from among a class of females whose habits rendered it unlikely that they should have families. This however does not appear to be very consistent with the statements of other authorities as to the jealousy with which they were accustomed to preserve the honour of their wives. It appears also that infanticide used to be commonly practised in these islands by all classes of the people, and quite as much by those who were not, as by those who were, members of the Arroy. Mr. Ellis gives it as his opinion, founded upon all the facts which he had been able to learn, that two-thirds of all the children born used to be thus sacrificed; and, according to his account, the murder was almost always committed by the parents themselves, neither of whom, as a general rule, evinced the least repugnance to the horrid act, or the least shame in acknowledging it. Forster, again, was told by Omai that the mother generally endeavoured to save her offspring, and that the deed was always perpetrated in such a manner as to show the general feeling to be, that it was one which ought to be hidden from the light of day. Without attempting to reconcile these contradictions, we may here merely remark that it seems at any rate difficult to understand how a practice, which thus appears to have prevailed universally, should have been at the same time, as we are told it was, the chief bond of the particular association we are now considering.

The persons who formed this society are described as having been held in the greatest honour by their countrymen, and as having been accustomed to spend their time in the enjoyment of all the abundance and luxury which the general admiration could shower upon them. They travelled about in companies consisting of many hundreds; and wherever they made their appearance, gaiety and dissipation became the order of the day. From some of the accounts it might almost be supposed that they were really an order of public players. They appear to have collected large audiences around them, whom they amused with dances and other exhibitions. Another conjecture, for it can scarcely be called more, is, that the members of the *Arreoy* were the body of the national soldiery, and that the privileges they enjoyed, and the high estimation in which they were held, were the inducements offered by the state to engage them to defend their country. In general these associated ibertines certainly appear to have been among the most eminent warriors of the nation.

Some accounts make these societies to have consisted exclusively of members of the chief families in the country; but, according to Mr. Ellis, they comprehended persons of all classes. If so, there must have existed some barrier against indiscriminate intrusion, the nature of which has not been stated. For if we are to believe the descriptions given of the advantages enjoyed by the members of the *Arreoy*, it is plain that nothing but the impossibility of obtaining admission into the association could have induced any person to decline entering it. Besides the ease, enjoyment, and honour, which were the lot of its members in the present life, their religion, we are informed, promised them the continuance of the same superiority over their fellow-countrymen in the next. There is no reason to suppose that the necessity imposed upon the members of destroying their children would alone have operated with any material effect to deter persons from seeking the high and tempting privileges which the association conferred; for, as we have seen, infanticide was a custom of universal prevalence among the inhabitants of those islands. It is probable either that the number of the members and the description of the individuals eligible were regulated by some law of the state, or at least that there was some form of election which gave the power of admission and rejection to the society itself. A circumstance which favours this last supposition is, that there are known to have been different classes of the initiated, rising above each other in rank, from one to another of which an individual could only raise himself by his meritorious conduct, and after having belonged for a certain time to the inferior class. Mr. Ellis enumerates seven of these classes. It is not likely that, while each subsequent step was thus made the reward of service and exertion, the attainment of the first degree should have been a matter of course and open to all. It is stated that the more fatiguing work of the public exhibitions was usually left to the novices, or at least to the younger members.

Women as well as men were members of the *Arreoy*. When it happened, as it sometimes did, that a child born to any of the members was spared by the pity of its parents, both were expelled from the society, and the mother received the reproachful name of *whannownow*, signifying 'bearer of children.' The children are said to have been commonly destroyed by suffocation; but various other methods were in use.

One of the happy consequences of the introduction of Christianity into the island of Otaheite has been the entire abolition of those profligate associations, as well as of the practice of infanticide generally. What effect this change may have upon the progress of population remains in great part still to be ascertained. Mr. Ellis states, that when the missionaries arrived at the islands, the natural proportion of the sexes had been so deranged, that there were four or five men to one woman. Mr. Malthus has given it as his opinion that the *Arreoy* was in all probability originally instituted with the view of preventing the inconvenient increase of population; and he seems to think that, from the unsparing rigour with which the fundamental law of the association appears to have been observed, it probably had that effect. But this opinion is in opposition to the general fact which, as he notices, had been before remarked by Mr. Hume, that the existence in any country of a law permitting infanticide had usually, from its tendency to promote marriages, by diminishing the fear of their consequences, been attended with the opposite result.

ARREST is the apprehending or restraining a man's person by authority of law.

In criminal matters the object of an arrest is to secure the person of one who has, or is supposed to have, committed an offence, in order that he may be brought before a magistrate; and then, if there appears sufficient ground of suspicion against the party to justify his being put upon his trial, the magistrate takes measures for securing his presence before the proper court, either by committing him to prison, or by taking bail for his appearance.

An arrest may be made either by virtue of a warrant, or, where the law authorizes it, without warrant. A warrant may be granted in extraordinary cases by the privy council, the secretaries of state, and some other public officers; but the only warrants which occur in the ordinary administration of the law are such as are issued by justices of the peace.

When a charge is made before a magistrate, it is his duty to examine the witnesses upon oath, and to take down their statement in writing; and then, if he see any probable ground of suspicion against the party charged, he issues a warrant for his apprehension. The person to whom the warrant is directed,—generally some constable or other peace-officer,—is bound to execute it as far as the magistrate's jurisdiction and his own extends, but if the party to be arrested escapes into another county, the warrant cannot be executed without being *backed*, that is, signed by a justice of the peace for that county. [See WARRANT.]

But in many cases an arrest may be made without a warrant; particularly by officers connected with the administration of justice. A constable, for instance, may arrest, in case of felony, if there is reasonable ground of suspicion; and for any breach of the peace actually committed in his view.

An officer may, upon a criminal charge, break open doors, if, upon demand of admittance, it cannot be otherwise obtained; he may likewise, in apprehending a person charged with felony, use any degree of force that may be necessary; and if the person charged attempt to save himself by flight or resistance, and is killed by the officer (there being no other means of preventing an escape), the homicide is justifiable; but if he kill the officer with the intent to oppose him in the execution of his duty, it is murder.

Private persons also are not only authorized, but required, to apprehend any person who commits a felony in their presence; and in pursuing such felon, they will be justified in breaking open doors and in using force, as much as an officer. A private person may likewise arrest upon reasonable suspicion of felony; but inasmuch as this is not a duty enjoined by the law, he is not armed with the same privileges as where he saw the offence committed: he cannot justify breaking open doors, or using the same degree of force; if he kill the supposed offender, he will be guilty of manslaughter; and if he be killed, the offence will be the same, and not murder: besides this, he acts at his own peril, and is liable to an action unless he can show that a felony had been actually committed, and that there was reasonable ground to suspect the person whom he arrested.

There are also several cases where private persons have the power of arresting given them by act of parliament. Any person whatsoever is authorized to apprehend for any offence against the Vagrant Act, 4 and 5 Geo. IV. c. 83. And where persons are found committing any offence against the Larceny Act, or the Malicious Injuries Act, 7 and 8 Geo. IV. c. 29 and 30, they may be apprehended, without warrant, by any peace-officer, or by the owner of the property, or by his servant, or any person authorised by him.

When an officer has arrested any one, he ought to take him before a magistrate to be examined as soon as possible. Where a private person has made the arrest, he will in general be justified either in taking the party arrested before a justice of the peace, or delivering him over to a constable of the place, and this alternative is expressly given him by the Vagrant Act; but the Larceny Act and the Malicious Injuries Act require that the person arrested should be forthwith taken before a justice of the peace. But if a person be apprehended in an attempt to commit a felony at night, he may lawfully be detained, even by a private person, till he can be carried before a magistrate.

There is likewise another mode of arrest for felony, and that is upon *hue and cry* raised; but though this was once

in ordinary practice, it has now fallen into disuse. [See *Hux and Cry.*] Hale's *Pleas of the Crown*, vol. i. p. 375, vol. ii. p. 72-120; Stephen's *Summary of the Criminal Law*, p. 239-244.

Arrest in civil cases is of two kinds: 1. that which takes place before trial, and is called arrest on mesne process; 2. that which takes place after trial and judgment, and is called arrest on final process, or arrest in execution. [See *Process.*]

The primary object of arrest on mesne process is to secure the defendant's appearance in court, so as to enable the plaintiff to proceed with his action against him. This compulsory mode of proceeding, being penal in its nature, was originally allowed by our law in such injuries only as are accompanied by force: its use, however, was gradually extended, partly by Acts of Parliament, partly by the fictitious proceedings of the courts, to almost every species of complaint; and by later regulations it has nearly been confined to cases of debt.

When it is intended to proceed by arrest, the plaintiff, after making an affidavit that the cause of action amounts to 20*l.*, which by stat. 7 and 8 Geo. IV. c. 71, is now the lowest sum for which a party can be held to bail, commences his action by suing out a writ, called a *capias*, directed to the sheriff, who, on its being delivered to him, grants a warrant to his inferior officers or bailiffs to execute it on the defendant. Upon making the arrest, the officer is required forthwith to deliver to the defendant a copy of the writ, and is not allowed to take him to gaol within twenty-four hours, unless, upon request made, he refuses to go to any place of safe custody. He is in general taken to the house of the officer (vulgarly called a 'spunging-house'), where (if not sooner lawfully discharged) he may be confined until the expiration of the eight days limited for the putting in of special bail.

When arrested, the defendant is in custody of the sheriff; but by stat. 43 Geo. III. c. 46, s. 2, he may obtain his discharge by depositing with the sheriff or his officer the sum sworn to, together with 10*l.* to answer for the costs, or by giving bail for his appearance to defend the action: this being what most commonly occurs, the process upon which an arrest is founded is called *bailable* process. For further information on this subject, see *BAIL*.

Arrest on final process, or arrest in execution, is one of the means by which a party who has succeeded in an action may compel performance of the judgment.

Arrest in execution may in general be resorted to in any case where, before trial, bailable process might issue; when execution has been taken out against the property, and there is not enough to satisfy the judgment, execution against the person may afterwards be resorted to; but if the person has once been taken in execution, no process can in his lifetime issue afterwards against the property. [See *Execution.*]

An arrest is made by *seizing* or touching the defendant's person. The officer is not justified in breaking open the defendant's house in order to arrest him; but, when once the arrest is made, he may break into any house in pursuit of him.

In France, imprisonment seems to have existed from the earliest ages as a means of execution to compel the payment of a debt, though its application was originally restricted to cases where the property of the debtor had been previously seized and found insufficient. In the reign of Louis XIV. a principle was introduced, which at the present day constitutes one of the characteristics of French jurisprudence; debts of a commercial nature being distinguished from debts purely civil, and arrest being allowed as of course in the former, but, in the latter, only in a few specified cases.

An arrest, by the law of France, cannot take place without being authorized by the sentence of a court. The cases in which this authority is exercised in matters not of a criminal nature may be classed under four heads:

I. In all cases of commercial debt to the amount of 200 francs (8*l.* sterling), arrest forms part of the sentence as a matter of course. The object of imprisonment is to compel the debtor to give up any property which he may be supposed to have concealed: after a certain length of confinement, it may be presumed that, if he has given nothing up, it was because he had nothing to give; and thus the reason for detaining him ceases to operate. The debtor is, therefore, in all cases discharged from prison, after a certain length of time, varying according to the amount of the debt.

In commercial cases, the length of imprisonment varies from one year to five.

II. In actions of a purely civil nature, arrest takes place only in those cases which are specified by the laws. The civil code (*Arts.* 2059, 2060) contains an enumeration of the cases in which it is pronounced as a matter of course. They are chiefly such as imply either gross fraud, or a breach of official duty. The length of imprisonment varies from one year to ten.

There are other cases in which the court have a discretionary power to pronounce sentence of imprisonment if they think fit; the length of confinement varies in this instance from one year to five. In all civil cases, 300 francs, or 12*l.* sterling, is the lowest sum for which a person can be arrested.

III. All public servants are liable to arrest in respect of any sum of money to the amount of 300 francs, 12*l.* sterling, due, by virtue of their office to the state, or any public establishment. The duration of imprisonment varies from one year to ten.

IV. With respect to foreigners not domiciled in France the law is peculiarly severe. As their property is presumed to be in their own country, the confinement of their persons is considered to be the only means by which they can be compelled to satisfy their creditors; they are, therefore, liable to arrest for all debts, whether civil or commercial, provided the sum amounts to 150 francs, or 6*l.* sterling. And for this sum a foreigner may be arrested, not only after final judgment, but as soon as the cause of action has arisen. In the latter case, however, he may obtain his discharge by finding sureties, or by proving that he is possessed of sufficient property in France to pay the debt: when arrested on final judgment, the duration of his imprisonment varies from two years to ten.

A debtor who has entered his 70th year cannot be arrested on final process, except in the case *stellionat*, the *stellionatus* of the Roman law; a fraud committed by a party in falsely representing property as being his own or as being free from incumbrance. And with the same exception, a debtor who is in prison is, on entering his 70th year, entitled to be discharged. The debtor likewise obtains his discharge in the following cases:—1. If the creditor give his consent thereto; or 2. If he neglect to advance the sum which the law requires him to pay for the support of the debtor. This sum is now fixed at 25 francs, 1*l.* sterling per month, except in Paris, where it is 30 francs; 3. By payment of the debt, costs and expenses; or, in cases not commercial, by payment of one-third thereof, and finding sureties for the remainder; or 4. By being allowed the benefit of cession, answering to a discharge under the Insolvent Act in English Law. [See *CASSIO BONORUM.*]

See *Code Civile*, *Arts.* 2059-2070; *Code de Procédure Civile*, *Arts.* 780-805; law of 17th of April, 1832; *Fœhl's Commentaire sur la Contrainte par Corps*.

ARRHIDÆUS, a bastard son of Philip III. of Macedonia, who, on the death of his half brother Alexander (B.C. 323) was named his successor by acclamation of the Macedonian troops (Diod. xviii. 2) and consent of Alexander's generals. His title was strengthened by marrying Eurydice, grand-daughter of Perdicas, Philip's elder brother. Being of weak intellect, he was a mere tool in the hands first of Perdicas, then Antipater, and finally of Polysperchon, who, in conjunction with Olympias, set up as a rival to him Alexander, son of Alexander the Great by Roxana, who was born after Alexander's death. Eurydice called in the assistance of Cassander; but falling into the hands of Olympias, was, with her husband Arrhidæus, put to death, B.C. 317. [See *ANTIGONUS*, p. 102. *ANTIPATER*, *PERDICA*.]

ARRI'ANUS, FLA'VIUS, a native of Nicomedia in Bithynia, and one of the most prolific Greek writers of the second century. The date of his birth is unknown, though it was probably during the reign of Domitian, or of Nerva, but we can only infer it generally from the following fact. In the twentieth year of the reign of Hadrian B.C. 136, the successor of Trajan, Arrian was governor of Cappadocia, and in this capacity he addressed a letter to the emperor, containing an account of his voyage from Trapezus (Trebisond) on the Black Sea, along its eastern coast as far as Dioscurias or Sebastopolis. The chief object of the voyage was to inspect the garrisons on this coast. The letter of Arrian to Hadrian is written in Greek, and contains, besides an account of the governor's own voyage, a complete Periplus, or description of the chief places all round the coast of the Black Sea.

(See Hudson's *Minor Geographers*, vol. i.) We cannot well suppose Arrian to have been under forty years of age at this time. Dodwell is inclined, for various reasons, to suppose that he might have been more than fifty when he was governor of Cappadocia. (See his *Dissertation*.) This is the only date in his life that can be fixed with any probability, and such as it is, must be used for his previous and subsequent life. In his youth Arrian was a pupil of Epictetus, who then resided at Nicopolis in Epirus, having been banished from Rome in the reign of Domitian, together with the whole body of philosophers. Epictetus died probably in the earlier part of Hadrian's reign, and Arrian commenced his career as a writer by publishing the *Encheiridion*, or 'Manual,' which is still extant, and contains the moral doctrines of his master. [See EPICTETUS.] He wrote also eight books, of which four are extant, entitled 'The Philosophical Disquisitions of Epictetus,' which, as he tells us in his preface, addressed to L. Gellius, contain the very words of his master. In addition to these he wrote a work entitled 'Dialogues of Epictetus,' and another, 'On the Life and Death of Epictetus,' both now lost. Hadrian, who aspired to the character of a philosopher, was on terms of intimacy with Epictetus, and probably saw him during his stay at Athens in A.D. 123 and 124; and it is not an unlikely conjecture that Arrian, the favourite pupil of Epictetus, was introduced by him to the emperor. Arrian, in his 'Life of Alexander,' seems to attribute his own rise in the world to his literary reputation. After the death of Epictetus and the publication of his philosophical works, Arrian acquired the privileges of a Roman citizen and the Roman name of Flavius; we may presume also the rank of senator, as he was the governor of so important a province as Cappadocia: whether he ever enjoyed the consular dignity does not appear quite certain. Suidas (*Ἀρριανός*) says, on the authority of Heliconius, that he attained the consulship. That he was governor of Cappadocia with full powers is evident from the *Periplus* of the Euxine Sea and other authorities. Honours and emoluments in his native city of Nicomedia were also conferred upon him, for we learn from Photius, that he held the priesthood of Ceres and Proserpine, a function to which, no doubt, considerable profits were attached, as we may see from other similar examples.

In A.D. 137 a disturbance broke out in the neighbourhood of Trapezus. Arrian's head-quarters, headed by a chief called Pharasmanes. (Dion. Cassius, lib. 69, cap. 15.) The activity of the governor appears to have checked this rising without any further measures than a vigorous display of force; and the war, such as it was, is only curious from the name of the people headed by Pharasmanes. They are called Alani, possibly a mistake for Albani. (See Dion.) We still possess a fragment by Arrian, entitled 'The Order of Battle against the Alans,' probably a part of a larger work on the Alan war; and also a Treatise on 'Military Tactics,' written in the 20th year of Hadrian. (See the conclusion of the *Tactike*.) Gibbon's remark (note, chap. i.), 'that with the true partiality of a Greek, Arrian rather chose to describe the phalanx of which he had read, than the legions which he had commanded,' is not correct, if the fragment on the Alan war was written by him.

After the death of Hadrian (B.C. 138), Arrian probably retired from public life, but he was by no means idle. He wrote a history of 'Trajan's Parthian wars,' in seventeen books; the 'History of Dion of Syracuse;' the 'History of Bithynia,' his native province, in eight books; and, to give a little variety to his occupations, he favoured the public with the biography of the robber Tilliborus, a fellow who for some time annoyed the neighbourhood of Mount Ida. (Lucian, *Alexander*.) A work on comets and meteors, known only by some extracts in Stobæus, is attributed to an Arrian; but whether the author was Arrian of Nicomedia cannot be determined. The work by which he is now best known to us is the 'History of Alexander's Campaigns in Asia,' in seven books, founded principally on the histories of Ptolemy the son of Lagus, King of Egypt, and Aristobulus the son of Aristobulus, both of them the companions of Alexander in his wars. This is almost the only source for the history of Alexander's conquests that we can now use with any confidence, and, indeed, without it we should be utterly unable to form any judgment at all on the military operations of the Macedonian king. Arrian's narrative, however, is often incomplete, and occasionally obscure; the obscurity sometimes, though rarely, arises from the language of the writer, but mainly from the

difficulties which he must have experienced in reconciling conflicting authorities (see Arrian's *Preface*). Arrian's history, however, is often the best source that we can appeal to for illustration of the comparative geography of Asia. A general tone of good sense is found all through, but, as was usual with those who undertook to write the Life of Alexander, the faults and vices of his hero are touched with a lenient hand. There is no absolute proof to show at what period Arrian wrote this work. St. Croix tells us, on the authority of Photius, that he wrote it when very young: Dodwell believes it was one of his later productions, written during his retirement and the decline of his life. The following passage in his History of Alexander may help to decide:—he speaks of himself as well known (i. 12), and makes allusion to his honours; but he prides himself still more on his literary labours, which he had prosecuted from his youth upwards. He concludes by telling us, that as Alexander was the best captain, so he himself was the best master of the Greek language, and the fittest person to write about him.—All this savours more of an old than a young author.

As a continuation to his History of Alexander, he wrote a little work, still extant, entitled 'On India,' which contains a great deal of curious matter on the natural productions of that country, and the manners of its inhabitants. It contains also an extract from the 'Voyage of Nearchus,' (cap. 20, &c.) who conducted the fleet of Alexander from the Delta of the Indus to the Euphrates. Arrian's work on the History of Alexander's successors, in ten books, would have formed a valuable commentary on that busy but obscure period; it is now only known by an extract from Photius.

Another valuable little treatise, which bears the name of Arrian, is entitled 'The Periplus of the Erythrean Sea,' that is, the coast description of part of eastern Africa, Arabia, Persia and India: it is by some critics assigned to a period somewhat later than that to which Arrian's life can with reasonable probability be extended. This interesting monument of the early commerce of the Indian Ocean has been illustrated by Dr. Vincent. (*Periplus of the Erythrean Sea*.)

Arrian in general affected to imitate the Attic Greek of Xenophon, but the little treatise on India is written in a kind of Ionic dialect.

Arrian, as we may see from his letter to Hadrian, was no unskilful courtier, and from the rest of his works we may judge him to have possessed a large share of vanity. The model that he proposed to himself was Xenophon the Athenian, and certainly the pains which he took to assimilate himself to his prototype are not a little curious and amusing. Xenophon was an Athenian by birth; Arrian contrived to get himself made one. Xenophon wrote on the philosophical doctrines of his master, Socrates; so did Arrian on those of Epictetus. Xenophon wrote an account of the Expedition of the younger Cyrus, and gave it the appropriate name of the Anabasis or Ascent; Arrian also gave to his History of Alexander, the less appropriate name of the Anabasis of Alexander. Xenophon wrote his Hellenica, or History of Grecian Affairs, a kind of supplement to the Peloponnesian War; Arrian wrote a History of Alexander's successors. Xenophon wrote a Treatise on Hunting; so did Arrian. Both works still remain. Finally, Arrian very modestly calls himself the younger Xenophon, and sometimes simply Xenophon. It is unnecessary to pursue the parallel farther; the following quotation from his book on Hunting will show his character:—'This I shall say, being of the same city with Xenophon, and having the same name, and from my youth up having had the same pursuits—hunting, military science, and philosophy.' Xenophon was a good judge of a horse and a dog, and Arrian also shows by his remarks that he was a true lover of field sports, and had practical knowledge on these matters. He endeavours to supply some of Xenophon's omissions, which he says 'were not caused through any negligence on the part of Xenophon, but from his being unacquainted with the Celtic breed of dogs, and with the Scythian and Libyan breeds of horses.' Arrian's description of his favourite dog Horne (*Ὀρμή*), his constant companion and friend, is written with the feeling of a sportsman, and gives us also a favourable opinion of his character. How long the second Xenophon, huntsman, general, historian, and philosopher lived, we do not know; it is possible that he lived till the beginning of the reign of Marcus Aurelius, B.C. 161, which would fail to complete the parallel between him and Xenophon, who

lived to be above ninety years old. (Lucian, *Macrobi.*) Dion Cassius (see Suidas) is said to have written a life of Arrian. (See St. Croix, *Examen Critique*, &c.; Dodwell's *Dissertations* in vol. i. of Hudson's *Minor Geographers*.)

There are many editions of separate parts of Arrian, but only one, as far as we know, of all his works; that by Borheck, 3 vols. 8vo. Lemgo, which is very incorrect. The latest edition of Arrian's History of Alexander and his India that we have seen, is by Schmieder, Leipzig, 1798. The Periplus of the Euxine and Erythrean seas is in Hudson's *Minor Greek Geographers*, vol. i. A translation of Arrian's book on Coursing was published by J. Bohn, London, 1831, with classical and practical annotations, and with an appendix and twenty-four embellishments from the antique: only 250 copies were printed. Dr. Dibdin calls this book a 'dear delight.' An English translation was published in 1729, in 2 vols. 8vo., by Mr. John Rook, of the History of Alexander's Expedition, with notes, historical, geographical, and critical. To this translation is prefixed, M. Le Clerc's Criticism upon Quintus Curtius; Arrian's Indian History; his Account of the Division of the Empire after Alexander's Death; Raderus Tables; a Catalogue of the Authors who have written upon his History; a Chronology of the whole; and a complete Index. There is also a translation of the Periplus of the Euxine Sea, by Dr. William Falconer, published in London, in 4to. in 1805. The latest translation of the Anabasis that we have seen noticed is, *Histoire des Expéditions d'Alexandre*, par P. Chaussard, 3 tom. 8vo., Paris, 1802.

ARRIE'GE, or **ARIE'GE**, a river in France, one of the tributaries of the Garonne. It rises deep in the recesses of the Pyrenees, in the ridge which separates France from the valley of Andorra in Spain. It flows N.E., N., and N.W., forming an arc, to the town of Tarascon, receiving on both sides a number of streams, which descend from the lofty ridges, and drain the secluded valleys of the Pyrenees. From Tarascon, which is thirty-one miles from its source, it flows due N. about thirty-one miles farther, by Foix and Pamiers, to near Saverdun; from thence its course is N.N.W., by Cintegabelle (where it receives the Lers, its principal tributary, which falls into it on the right bank), to Auterive, about eleven miles. Here the navigation commences, and the stream flows, still in the same direction, about twelve miles, to its junction with the Garonne, about six miles above Toulouse. Its whole course is about eighty-five miles.

This stream is noted for the excellence of its fish, especially salmon-trout; and also for the gold which is found in its bed. This first occurs at Crampagnac, about four miles and a half N. of Foix, in small quantity; but, following the course of the stream towards the north, it becomes more abundant, and the village of Varilhès, which is nearly two miles below Crampagnac, serves as the southern limit of the gold-searchers; Pamiers may be considered the centre. It is between Varilhès and Pamiers that the largest grains are found; these have, in some very rare instances, weighed half an ounce troy. The gold district continues as far down as Saverdun, fourteen or fifteen miles below Crampagnac, at which it commenced. The subsoil of the neighbourhood and the banks of the river in this district consist of pebbles of all sorts and sizes, more or less firmly united by a softish, easily crumbled, calcareous cement. The gold, however, is found detached from the pebbles with which it is intermingled. The soil above the pebbly stratum produces excellent crops.

The brooks which fall into the Arriège within the limits above described have gold in their channels, but the whole quantity gathered, whether in the river itself or its feeders, is at present inconsiderable.

Some have supposed that this stream derived its name from the gold found in it, asserting that it was antiently called *Aurigera* (gold-bearing); but we are not aware that any antient author gives support to this assertion, and the etymology itself is disputed. (*Encyclopédie Méthodique*; Pignaniol's *Descript. de la France*; Malte-Brun.)

ARRIE'GE, a department of France on the Spanish frontier, comprehending the former county of Foix, and parts of the province of Languedoc, and of the district of Couserans in the province of Gascony. It includes a considerable part of the range of the Pyrenees, which form its southern boundary. On the N. and W. it is bounded by the department of Haute Garonne (Upper Garonne), on the N.E. and E. by that of Aude, and on the S.E. by that of

Pyénées Orientales (Eastern Pyrenees). Its greatest length is, from W.N.W. to E.S.E., 67 miles, and its greatest breadth is 48 miles. Its superficial contents are 2169 square miles, according to M. Balbi; or 2193, according to M. Malte-Brun. The population is 248,000, giving 114 inhabitants to the square mile, according to the first mentioned calculation of surface; or 113, according to the second.

This department is traversed by numerous streams which descend from the Pyrenees, and which flow northward forming by their union the Salat, the Volp, the Arize, and the Arriège, which fall successively into the Garonne. Of these the Arize is remarkable for its waters passing underground in two places. The Leze and the Lers, streams of considerable length, are feeders of the Arriège. Several of the brooks westward from the Arriège yield gold; they traverse a soil similar in its nature to that through which the Arriège flows in the gold district.

The mountains are very lofty. The following are the principal summits, with their altitude in English feet. Montcalm, 10,663; Peak of Estats, 10,611; both near the head of the valley of the Vic-de-Sos, a feeder of the Arriège. Peak of Serrere, 9646; Peak of the Port (or Pass) de Siguier, 9613; Peak Pedrons, or Pedrous, 9511; Peak of Mountouléon, 9492; Peak of Fonte Argente, 9370; Peak Lanoux, 9370; Peak of Monvallier, 9249; Prigue, or Peyrie, 9121; Mount Carbere, 8655; and Roc-Blanc, 8320. The Port-de-Rat, at the head of the valley of Vic-de-Sos, is 7473 feet high; that of Puy Moreins, to the east of the last, is 6299 feet.

The mineral wealth of the department is considerable. Iron, lead, copper, and silver, are procured; the last, however, not in any great quantity. There are mineral waters at Ax, a little town on the Arriège near its source; and coal, slates, marble, and jasper are wrought. Turquoises are found in some places.

The southern part of this department is of great elevation, and therefore very cold. It affords fire-wood and pasture. A considerable quantity of cattle is reared. Medicinal plants are numerous, and the vivid colours of the flowers add to the beauty of the country; a century ago the tulips were in high esteem with the florist. The northern and lower part of the department has a far higher temperature, and great fertility of soil; suited, however, for corn rather than for the vine. The fruit is excellent.

The chief trade of the department is in iron—which is wrought in considerable quantity, especially in the valley of Vic-de-Sos—cork, resin, and wool; and in mules, which are in estimation for their strength. Some manufactures are carried on, as of hats and hosiery, at Foix and Pamiers; of cottons, woollens, and linens, in the latter town; and of woollens, hats, leather, and paper, at St. Girons. The inequality of the ground forms a great obstacle to the transport of goods, which is chiefly effected by means of horses and mules.

The chief towns are Foix, the capital, on the Arriège (population 5000); Pamiers, also on the Arriège below Foix (population 6000); and St. Girons on the Salat (population 4500). Pamiers is a bishopric, and comprehends the whole department in its diocese. It is under the jurisdiction of the archbishop of Toulouse and Narbonne. [See FOIX, GIRON, ST., and PAMIERS.] Ax, on the Arriège, near its source, has a lead-mine (in the town), and some warm springs, much recommended in some diseases. The population of Ax, at the beginning of the present century, was about 1500. Mirepoix, on the Lers, about fifteen miles east of Pamiers, and Tarascon on the Arriège, had each nearly double the population of Ax at the same period.

The department sends three deputies to the chamber. It is judicially subject to the *cour royale* (assize court) of Toulouse.

ARRIS, in French *Arête* and *Arête*, is a term employed in building. It may be defined as the intersection or line in which the two straight or curved surfaces of a body, forming an exterior angle, meet each other. The term *arris*, synonymous with edge, is constantly employed by workmen engaged in buildings, especially in the formation of mouldings, whether of stone, wood, or plaster. In parallelopipedal bodies, on which the length and thickness may be measured, as in planks, bond timbers, shutters, &c., the term edge only is used. In Gothic architecture, owing to the numerous lines and angles, the *arris* is of frequent occurrence; for example, in the mullions and transoms (see **MULLION** and **TRANSOM**) of windows, where there are many mouldings, every

edge is an arris, whether formed by square mouldings or by the intersection of curves. In Grecian architecture, the raised edge between two flutes of a Doric column, and in both Grecian and Roman architecture, the lines bounding every flat moulding are so many examples of the arris.

ARRIS FILLET, a small triangular piece of wood, used to raise the slates of a roof against the shaft of a chimney or a wall, to throw off the rain more effectually; it is used for the same purpose also in forming gutters round skylights, which have the same inclination as the roof, and are slightly raised above it.

ARROBA, a Spanish measure, both of weight and of capacity, and used as one or other both in Portugal and the Canaries. It exists in Morocco, under the name of Kroba, but with great local variations of value. It is also found to be different in different parts of Spain.

Weight Arroba in Pounds Avoirdupois.

Spanish standard	25.36
Alicant	27.38
Valencia	28.25
Aragon	27.76
Majorca	22.93
Lisbon	32.38

Measure Arroba in Imperial Gallons.

Spanish standard	Greater Arroba	3.54
	Lesser Arroba	2.78
Malaga		3.49
Valencia		2.59
Canaries		3.54

The standard greater arroba (used for wine) is also 981 cubic inches, and the lesser (used for oil) is 771 cubic inches.

ARROE is a Danish island off the eastern coast of Schleswig, due south of the island of Funen, and at the southern entrance into the Little Belt, from which it extends in an oblong form about fourteen miles from N.W. to S.E. Its superficial area is thirty-two square miles; it is divided into five parishes, contains a town and market-village, and has between 7000 and 7600 inhabitants. The surface of the island is a continued level, interrupted only by a lake called the 'Wilt-See': the soil is very rich and productive, but has no wood. The inhabitants breed considerable quantities of cattle, and raise grain, peas and beans, vegetables, aniseed, and cummin seed: they are actively engaged likewise in fishery and navigation. The landvoegt, or bailiff, exercises the executive and judicial powers in all but civil causes, the latter of which are under the cognizance of a local tribunal. Arrøeskioebing, at the eastern side of the island, in 54° 53' N. lat. and 10° 35' E. long., is the capital; it has a convenient harbour, formed by the opposite shore of the island of Deyerbe, with which Arrøe is connected by a bridge. The town consists but of four streets, and has a church, three schools, two of which are for the education of navigators, and 1400 inhabitants, who are the owners of above fifty vessels, and depend chiefly upon trade and shipping for their maintenance. The market-village is called Marstall; it is situated on the western side of the island, and contains about 1480 inhabitants, wholly mariners and fishermen. The island itself forms part of the Duchy of Schleswig.

ARROO, a large island, or, more strictly speaking, a group of islands, in the eastern seas, situated to the south and west of Papua or New Guinea, and north-east from Timor-laut island. The cluster consists of five islands, divided from each other by such narrow channels that the whole have been sometimes considered as one island. The centre lies nearly in 6° S. lat. and 135° E. long. The length of the whole from north to south is about 140 miles, and the average breadth about one-fourth of that measure.

Arroo has never been explored by Europeans, and little or nothing is known of either the interior of the country or the character of the inhabitants. What little knowledge we have of the place has been obtained through the report of Chinese merchants settled at Banda, who carry on a traffic between the islands, procuring from Arroo pearls, tortoise-shell, edible birds'-nests, and an aromatic bark named missoy, which resembles cinnamon, and is much used among the Eastern islands, although never, or but very rarely, imported into Europe.

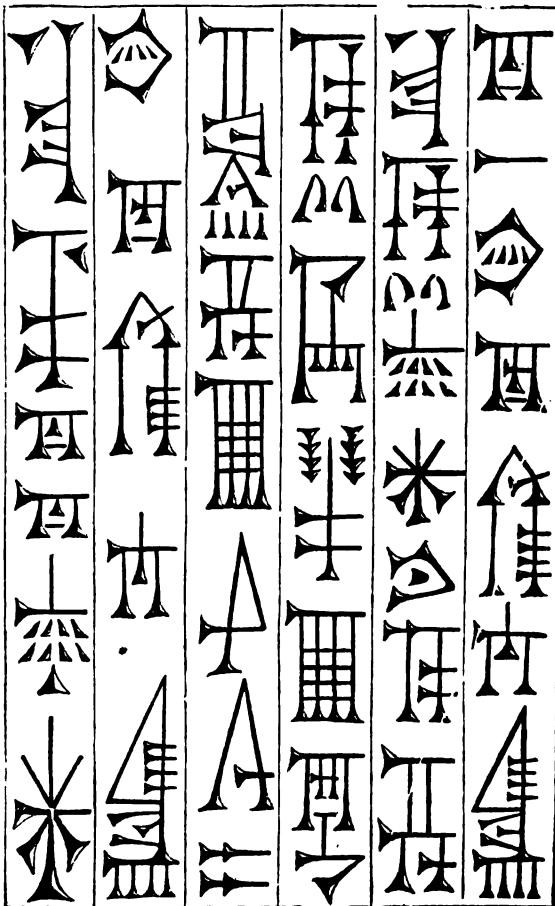

This cluster of islands is likewise remarkable as being much resorted to by birds of Paradise, which breed here in

large numbers. These birds are caught for the sake of their beautiful plumage by the natives, who first cut off their legs, and then drawing their entrails, preserve the remainder by means of fumigation. Valentyn has described seven varieties of these birds, of one of which specimens are sometimes found thirty inches in length. In this dried state these birds likewise form an article of commerce between the natives and the Chinese traders. (See Malham's *Naval Gazetteer*, and Hamilton's *East India Gazetteer*.)

ARROW, see **ARCHERY** and **ARMS** (Weapons).

ARROW-HEAD. [See **SAGITTARI**, Constellation.]

ARROW-HEADED CHARACTERS, a name particularly given to those marks which have been found stamped on the bricks of Babylon, and cut upon the marble monuments at Persepolis. They have been found also at Nineveh, on some rocks near Argish on the lake Van in Armenia, at Shus (the site of the ancient Susa), and more rarely in Egypt. The arrow-headed characters have also been called in Latin *cuneiformes*, and in German *keilformig*, or *die Keilschrift*; meaning wedge-shaped, and wedge-shaped characters. The arrow-headed character is formed from a very simple element, an isosceles triangle or wedge. Two of these are sometimes joined so as to form a figure not unlike an extended pair of compasses, or very open barbed arrow-head. Some writers on this subject have considered that the characters of Babylon differ essentially from those of Persepolis; but more accurate observation has led others to the conclusion that the cause of the variation lies merely in the difference of the materials on which they occur. Those of Babylon are coarsely stamped upon brick; the Persepolitan inscriptions are

sculptured upon marble. The Babylonian characters on account of their ruder shape, are often called nail-headed.

The Persepolitan have a more distinct form, and therefore the term arrow-headed more peculiarly applies to them.

The tablet given in p. 397 is a copy, somewhat reduced, of one of the bricks brought from Babylon, and now in the museum of the East India House. Beneath is a representation very much diminished of one of the bricks: the inscription is on the upper side, and surrounded by a broad plain margin.

It is remarkable that neither the Greek nor Latin classical writers make any very distinct mention of the arrow-headed character, though it has been conjectured that the *Ἀσσυρία γράμματα* of Herodotus, iv. 87, and of Thucydides, lib. iv. 50, as well as the *Litteræ Assyriæ* of Plinius, lib. vii. c. 56, refer to Babylonian inscriptions in this character.

Sir William Ouseley, in his *Oriental Collections*, has communicated from a Mohammedan manuscript what professes to be a Persepolitan alphabet; but, like other alphabets which that manuscript contains, it is a mere fiction.

Della Valle saw the supposed ruins of the tower of Babel in the year A.D. 1616. Pietro Della Valle (*Voyage*, Paris, 1747, tome v. p. 320, &c.) and Figueroa, ambassador to the court of Spain, were the first European travellers who are known to have formed any conjecture respecting the interpretation of the arrow-headed characters. They supposed that the direction of the wedges and angles on the Persepolitan monuments favours the conclusion that the inscriptions are to be read from left to right. Chardin inclined to the same view, but added, that they might also be read perpendicularly.

Mandelslo, one of the most intelligent early travellers, who visited the ruins of Persepolis about A.D. 1638, describes the characters which he found there as *triangular, pyramidal, or like obelisks* (i. p. 11, Leyden ed.)

Chardin, Le Brun, and Kämpfer, towards the close of the seventeenth century, visited the magnificent ruins of Tchelimînâr or Tchelimînâr, which is the modern name of Persepolis. But the travellers of that age seldom took the trouble to copy inscriptions which they did not understand; or, if they attempted a transcript, it was generally inaccurate.

Hyde (*de Relig. Vet. Pers.* pp. 527, 528) and others supposed that the arrow-headed characters at Persepolis owed their origin merely to the capricious whim of the architect, and were placed as mere ornaments round the doors and windows. Others took them for talismans and charms.

In the *Archæologia* (vol. xiv. p. 55) of the London Society of Antiquarians, there is an account, by Dr. Hulme, of a sun-baked Babylonian brick which has the figure of a lion impressed upon it, with an inscription in a different, probably a later, character, of which Mr. Henly, in the same volume, p. 206, discovered the meaning to be *IN 73Y, a brick baked in the sun.*

Niebuhr, after his return from the East, published the earliest exact copies of the arrow-headed inscriptions; and thus gave rise to some attempts to explain them; although, owing to the silence of antient writers, little or no external help could be obtained.

Olaus Gerhard Tychsen of Rostock published in 1798, his *Lucubratio de Cuneatis Inscriptionibus Persepolitianis*, and was followed by Münter at Copenhagen (who lately died Archbishop of Zealand) in an Essay published in Danish in the year 1800, and in German in 1802. Tychsen and Münter thought they had ascertained that the arrow-headed characters are alphabetical, that the words are separated by a character placed obliquely, and that they are to be read from right to left, like the Indian and European alphabets. They endeavoured to prove that a certain group of arrow-headed characters frequently recurring must signify 'king.'

Dr. Joseph Hager published in the *Monthly Magazine* for August, 1801, a fac-simile of one of the bricks stamped with arrow-headed characters, which had been sent to the East India Company; and, in the same year, a dissertation on the newly-discovered Babylonian inscriptions. Dr. Hager supposed the characters to be monograms, formed and combined arbitrarily, and designed to express, not letters or syllables, but either whole sentences or whole words. (Dr. Hager, *Dissertation on the Babylonian Inscriptions*, London, 1801, 4to.) He was of opinion that the characters on the bricks indicated the brick-maker's name. The fac-simile published by Hager excited the inquiries of Lichtenstein. Lichtenstein maintained these characters to be a variety of the antient Arabic or Cufic character, which is derived from the Syriac Estranghelo, and is, with few alterations and modifications, still used in Africa, principally in the

empire of Morocco. Led by this supposition, Lichtenstein read, or fancied that he read, some passages of the Koran, or at least imitations of the Koran. He then proceeded to form an alphabet from the fac-simile, which he applied to some Persepolitan inscriptions given by Niebuhr on plate xxiv. under C. E. and L.; and he produced as the result some Persian words, the Persian characters being, he believed, exchanged for the corresponding signs in the Persepolitan alphabet. Several other arrow-headed inscriptions he has declared to be convertible, by the substitution of the Persepolitan signs for the alphabetic letters which they represent, into pure Arabic words. One inscription he considers to be, by a similar process, reducible into words in the Chaldee, or rather in the Aramaic language. Several other arrow-headed inscriptions he has declared to be in pure Arabic, and one in Chaldee, or rather in Aramaic. This writer asserts that the arrow-headed characters are to be read from left to right. He refers the inscriptions in the ruins of Babylon to the seventh or eighth century after Christ.

The interpretations of Lichtenstein are made upon the supposition that in the various combinations of arrow-headed characters one only is essential, and that the rest are added without either necessity or rule. Thus various groups of characters, however different, obtain the same value, according to his interpretation. The resemblance of some strokes of the arrow-headed characters to the Cufic is the only ground for the interpretation which he has offered.

The present director of the gymnasium at Hanover, Dr. Grotefend, has published several treatises on cuneiform characters. It is said that he was led to make it the object of his peculiar attention in consequence of a trifling dispute with one of his friends; in the course of which he laid a wager that he would decipher one of the Persepolitan inscriptions. His dissertation under the title *Prævia de Cuneatis, quas vocant, Inscriptionibus Persepolitianis legendis et explicandis Relatio*, was read before the Royal Society of Göttingen in the year 1800; it was reviewed by Tychsen in the forty-ninth number of the *Göttingischen Gelehrten Anzeigen*, September 18, 1802; and the manuscript, revised and improved by the author, is now in the possession of the London Asiatic Society, and will soon appear in an English translation. Grotefend has also published dissertations on the same subject in various numbers of the *Fundgruben des Orients*.

The leading points of Grotefend's views are,

1. That the arrow-headed characters are not simple ornaments or numerical figures, but real alphabetic characters.
2. That there are on the inscriptions of Persepolis three different systems of arrow-headed or cuneiform writing; that every inscription is triple, so that whosoever is able to decipher one will know the sense of the two others. This triplication of inscription Grotefend finds also on a vase belonging to the National or Royal Library at Paris. In this opinion the late Professor Tychsen of Rostock agreed.
3. That the arrow-headed characters are not syllabic; otherwise there would be words of ten syllables.
4. That all the Persepolitan arrow-headed inscriptions are to be read from left to right.
5. That in the first of the arrow-headed systems there are forty signs; that among these signs are included separate characters representing both the long and the short related vowels. This opinion Grotefend supports by the analogy of the Zend. Tychsen and Münter say nearly the same.
6. That the inscriptions of Persepolis are in Zend.
7. That these inscriptions belong to the period between Cyrus and Alexander. Grotefend thinks that he has discovered in every inscription which he has examined the name of either Darius Hystaspis or Xerxes.

In the *Lettre de M. Silvestre de Sacy à M. Millin sur les Inscriptions des Monumens Persepolitains, extraite du Magasin Encyclopédique, Année VIII.* (1803), tome v. p. 438, this great orientalist points out the inconsistencies in Lichtenstein's statements published in the *Braunschweigischen Magazin*. De Sacy expressed his doubts if Lichtenstein would be able to substantiate his assertions in the more elaborate work which he had promised. This work appeared in quarto under the title *Tentamen Paleographiæ Assyriæ*, 1803, and fully confirmed the predictions of De Sacy. Though De Sacy was more inclined to favour the system of Grotefend, he objects to the grounds on which he maintains that the characters are not syllabic; for De Sacy observes, that in the Sanscrit, Basque, and Greenland languages there are words of more than ten syllables. To the opinion of

Grotefend that the forty signs must contain long and short vowels, because there would otherwise be too many for the purposes of an alphabet, De Sacy objects that the Sanscrit has more than forty consonants, and that in various Shemitic alphabets the shape of the characters is altered according to their position, so that there seem to be more consonants than actually exist. Compare the Arabic and Syriac alphabets.

Dr. Hager, professor of Oriental languages in the University of Padua, published at Milan in 1811, his *Illustrazione d'un Zodiaco Orientale*, which contains matter bearing upon our present subject. The work of Maurice on the *Ruins of Babylon and Persepolis*, London, 1816, contains some observations which coincide with those lately published in the *Morning Watch*, which will be noticed at the conclusion of this article. Proceeding in chronological order, we have next to notice an 'Account of the Progress made in Decyphering Cuneiform Inscriptions,' by Mr. C. Bellino, read on the 13th June, 1818, and published in the *Transactions of the Literary Society of Bombay*. Sir William Ouseley's *Travels*, 1819-1823, as well as the second volume of Ker Porter's *Travels*, 1822, p. 418-426, contain remarks on cuneiform characters, and several fac-similes of them. Several arrow-headed inscriptions are exhibited and explained in *A Dissertation upon the Antiquities of Persepolis*, by William Price, F.R.S.L., Assistant-secretary to Sir Gore Ouseley, Ambassador to the Court of Persia, London, 1825. One of these inscriptions contains a combination of hieroglyphics and arrow-headed characters on a scroll, found in the case of an Egyptian mummy. The *Mémoire relatif aux Antiques Inscriptions de Persépolis lu à l'Académie des Inscriptions et Belles Lettres*, by M. J. St. Martin, 1823, contains some modifications of the opinions of Grotefend. Kenrick's treatise on the 'Antient Inscriptions of Persepolis,' in the *Philosophical Magazine*, 1829, gives an historical survey of the explanations attempted up to that time, and communicates the fact of Schulze having found more than forty arrow-headed inscriptions near the lake Van in Armenia. This has been confirmed by Colonel Monteith's tour through Azerdibijan, &c. (*London Geog. Journ.* 1833). He remarks, that five miles from the fortress of Argish, on the banks of the lake Van, are some remarkable rocks covered with arrow-headed inscriptions. This place is frequented by pilgrims of all religions. The Mohammedans even consider them sacred, though they allow their date to be anterior to the existence of their religion. Colonel Monteith procured an impression of some of the arrow-headed characters on the rock, but they are not given in the *Geographical Journal*.

In each of the last four numbers of the *Morning Watch* there is a dissertation by the editor, on the 'Records and Science of Babylon' in general, and on the arrow-headed characters in particular. These dissertations treat principally of the Babylonian inscriptions, and of the bricks found in the ruined buildings more especially; but we understand that the writer has since directed his attention to the Persepolitan remains; and proposes to give a further development of his system. He considers that the arrow-headed characters were first used to symbolise the heavenly bodies; that they are neither alphabetic nor syllabic in their nature, or primary application, though there are instances of their occasional employment to express proper names, as they would be written by an alphabet; that they are not intended, like the Egyptian hieroglyphics, as representations, but simply as symbols.

The editor of the *Morning Watch* believes that the specimens of cuneiform writing found at Nineveh, Persepolis, and Babylon, differ from each other in the individual characters; the elementary characters in the Ninevite inscriptions being different from those of Persepolis; and the Babylonian writing, including the characters of the two others, with some in addition peculiar to itself; that they differ also in the modes of combination; the characters of Persepolis always stand detached and never come into contact, being grouped by juxta-position only; while the Babylonian characters are scarcely ever combined without contact, forming stars, crosses, squares, and triangles in great variety.

This writer divides the Babylonian inscriptions into four classes—calendal, astronomical, genealogical, and magical, or talismanic; noticing a difference either in the elements, or the use, according to the class. He considers that the first two classes have the same elements, but that they differ

in the length and arrangement of the series; the calendal inscriptions, containing at the most thirty-five, and usually only thirty groups, arranged in either ten, seven, six, four or three lines, and that the astronomical series contain an indefinite number both of lines, and of groups in each line and in the whole. The inscription on the stone in the museum of the East India Company, which was obtained by Sir Harford Jones, and presented to the Company by Sir Hugh Inglis, contains nearly 600 lines, and more than 680 varieties of grouping. The calendars, for such he has been led to consider the bricks to be by arguments deduced from the order and recurrence of the signs, he states to have contained inscriptions corresponding to the periods of solar and lunar time, so arranged as to admit of a ready comparison of the two; the character employed for these two classes of inscription nearly resembled a straight horn.

'The genealogical character,' he says, 'avoids the horn-shape, and is made up of combinations of two elementary characters; one of which is very narrow, the other very broad; one like a mace or the handle of a lance, the other like a funnel or a pyramid hollowed out to make its point more taper. A series of such combinations runs along the top of these inscriptions in regular order as long as a dynasty lasts, and clusters of such characters hang down to indicate the descent or passage to another dynasty; indications of the date or period seem to occur at the bottom.' The talismanic, or magical character, he states to be 'very uniform, though very abundant, and never designed to have a meaning, being merely a confused medley of forms somewhat similar to those which were known, but so arranged as to be wholly unintelligible. The form of known characters was so far preserved as to have the appearance of a meaning in order to keep alive interest and induce the belief of hidden mystery; while the disorderly clustering and crowding of random forms and the monotonous repetitions of the same form from the very same stamp, demonstrate the design to mystify and deceive by opposite means. The talismans or amulets themselves are found in great abundance, and are of two descriptions; one kind has *indented* characters, the other *raised* characters. 'These,' he says, 'must not be confounded with the seals, whether cylindrical or flat, as these last contain seal characters which throw light on the other inscriptions.'

This writer entertains expectations that the interpretation of the Babylonian inscriptions according to his system will throw much light both on the history of astronomical science and on the dates of antient chronology.

ARROW-ROOT. An article of commerce, which is imported in considerable quantities from both the West and the East Indies. It is a farinaceous substance, prepared from the roots of certain plants. That which is brought from America is made from the root of the *Maranta Arundinacea*; the arrow-root imported from Asia is extracted from the tubers of the *Curcuma Angustifolia*. [For the botanical descriptions of these plants, see *MARANTA* and *CURCUMA*.]

The English name of this preparation is derived from the use to which the Indians of South America were accustomed to apply the juice extracted from another species of *Maranta*—the *Maranta galanga*, which was employed as an antidote to the poison in which the arrows of hostile tribes were dipped.

The method of preparing the arrow-root of commerce is the same from whichever of the two plants it is extracted. The root, or tuber, as the case may be, must first be carefully washed, in order to remove the adhering particles of earth, and then it is either grated or beaten to a pulpy consistence in a mortar, which should be formed of wood. The pulp is next intimately mixed with a considerable quantity of pure water, by which operation the fibrous portion is separated from the farina, which remains mechanically suspended in the water. This fibrous portion is then removed, the larger parts by the hand and the minuter parts by straining through a hair-sieve. The remaining milk-like fluid is then left for subsidence, after which the water is drawn off. A second and sometimes a third washing in fresh water, and straining through finer sieves of the pulpy residuum, are then employed; after which the starchy matter is collected in a state of purity, and its moisture thoroughly evaporated by exposure to the sun and air. When perfectly dry it is packed in casks or boxes, and will retain its nourishing property unimpaired for many years.

Arrow-root may be used with advantage as the food of

young children or of persons in delicate health, since its nutritive property is great, and it is of very easy digestion. It is used either mixed with hot water or boiling milk, or in the form of puddings. The powder is frequently adulterated by the admixture of common starch or the farina of potatoes, and it is therefore advisable to purchase it in the package in which it is imported, or from some dealer of respectability. That which is the most esteemed for purity is imported from the Bermudas and New Providence; but within the last few years the arrow-root of Ceylon has acquired some celebrity: this is made from the American plant the *Maranta Arundinacea*, which was conveyed from the West Indies to Ceylon.

When imported from any British possession arrow-root is subject to the merely nominal duty of one shilling per hundred weight. The quantity consumed in the United Kingdom is about 400,000 pounds weight in the year. (*Library of Entertaining Knowledge, Vegetable Substances*, vol. ii.; *Porter's Tropical Agriculturist*; *Government Statistical Tables*.)

ARROW-ROOT. [See MARANTA.]

ARSACES, the founder of the great Parthian monarchy, which afterwards proved the most effectual bar to the extension of the Roman empire in the East. His birth is doubtful; and it is probably the flattery of courtly writers which traced it to the royal and antient Persian family of the Achæmenidæ. Justin speaks of him as being 'of doubtful origin, but tried valour, used to live by robbery; who, in the belief that Seleucus (Callinicus) was conquered by the Gauls in Asia, attacked Andragoras, the governor of the Parthians, and took possession of the empire of the nation.' (xli. 4.) According to Arrian (ap. Phot. *Bibl.* No. 58), a personal and family quarrel led him to raise the standard of revolt from the Syrian empire, B.C. 250, during the reign of Antiochus Theos, father of Seleucus, who, busied with his Egyptian wars, neglected this new source of disturbance until Arsaces had gathered a sufficient party to resist him successfully. Nor was Seleucus Callinicus more fortunate. He made two expeditions into Parthia: the first failed, and the second was still more unfortunate; for he was defeated in a great battle, taken prisoner, and died in captivity. The day of that defeat was long observed by the Parthians as the commencement of their independence. This is the reason that some writers have set down the revolt as first occurring in the reign of Seleucus; but it is certain that it took place under Antiochus. Arsaces reduced the neighbouring district of Hyrcania, and died, according to Justin, in a ripe old age. He seems, from the very meagre accounts which we possess, to have been a successful, and probably, therefore, a prudent and able prince; and, as a token of respect, the Parthian monarchs, to the end of their em-

pire, assumed from him the general title of Arsacidæ. He is said, in the *Anc. Un. Hist.*, to have been killed in battle against Ariarathes IV., king of Cappadocia; which may be true for anything we know to the contrary, but is not warranted by the authorities there quoted.

The small coin which we here give must rather be considered as a specimen of the coinage of the dynasty than as one which can with certainty be referred to any indi-

[From Visconti.]

vidual of the Arsacidæ. Eckhel (*Catalog. Mus. Cæsar. Vindob.* &c. i. p. 253) attributes this small coin to Arsaces I. or II.; Frölich assigns it to Arsaces I. Visconti (*Iconographie Grecque*) assigns the large silver medal (which is magnified to twice its linear measure) to Arsaces VII., and the small one to Arsaces II. The inscription which Eckhel gives on the reverse of the large coin differs from that in the British Museum, in having *Θεοκάρπος* instead of *Θεοκάρπος*.

ARSA/CIDÆ, a name given to the Parthian kings, from Arsaces, their progenitor. [For their history, see PARTHIA.]

ARSENAL, a public establishment where naval and military engines, or warlike equipments, are manufactured or stored. Toulon, Marseilles, Rochefort, and Brest, are naval arsenals.

In the arsenal of Paris, great guns or cannons are cast: in that of Woolwich, all the brass guns used in the British service are manufactured; gun-carriages, Congreve-rockets, all sorts of ammunition, and numerous articles of military equipment, are also both made and warehoused there.

ARSENIC. The term Arsenic is derived from the Greek *ἀρσενικόν*, which is found first in the works of Dioscorides, and of some other authors who wrote about the beginning of the Christian æra. It denotes, in their works, the substance called *σανδαράκη* by Aristotle, and *ἀρρηνικόν* by Theophrastus (although Pliny, lib. xxxiv. 18, seems to make a distinction between *σανδαράκη* and *ἀρσενικόν*), and is said to be the *auri pigmentum*, the well-known paint, orpiment.

Arsenic is a peculiar metal, which, though long known was first examined with tolerable precision by Brandt in 1733; it is very frequently met with in nature; sometimes in its pure metallic state, but more commonly combined with other metals, as iron and cobalt, or with sulphur, and frequently united with oxygen. It may be artificially obtained from its natural compounds in a mode which will be presently pointed out.

Arsenic has a steel gray colour and considerable brilliancy; its density is 5.700 according to Berzelius, and 5.884 by Turner's experiments; when sublimed, Dr. Thomson states that its density is only 5.235; the native metal is granular, and the artificial crystalline; it is extremely brittle, and consequently easily powdered. When arsenic is exposed to the air, it soon loses its lustre, and becomes black on the surface; the artificially obtained metal not only suffers these changes, but falls to powder by the action of the air: in this state it is known on the continent by the name of *fly-powder*, and is supposed by Berzelius to be a peculiar oxide of arsenic; most chemists, however, regard it as a mere mixture of arsenious acid and the metal. When kept under water, arsenic undergoes no change; if heated to 356° Fahrenheit, it is volatilized, without previous fusion: the vapour has a strong smell, resembling that of garlic and this, to a certain extent, is relied upon as proof of its presence; the vapour readily condenses in small brilliant crystals of metallic arsenic, the form of which it is difficult to determine.

Arsenic and oxygen combine in two proportions, and both compounds possess acid properties; that which contains the smaller quantity of oxygen is termed *arsenious acid*; according to Berzelius it consists nearly of—

2 atoms of arsenic	$38 \times 2 = 76$	or 1 atom	$\cdot \cdot = 38$
3 atoms of oxygen	$8 \times 3 = 24$	$1\frac{1}{2}$ atom	$\cdot \cdot = 12$
atomic weight	$\cdot \cdot = 100$	combining weight	$= 50$

As a natural product, arsenious acid is extremely rare;

Obverse.

Reverse.

[British Museum. Silver.]

it may be artificially prepared by heating the metal in atmospheric air, when, being very combustible, it burns and combines with oxygen; the white vapour of arsenious acid formed, speedily condenses, and frequently in the form of the regular octahedron; this acid may also be procured by heating the metal in very dilute nitric acid, which being decomposed yields oxygen. These processes are, however, needless, for arsenious acid is met with abundantly, and very pure, as an article of commerce; being formed and volatilized during the roasting of cobalt ores, it is first condensed in an impure state, and purified by a second sublimation in an iron vessel. Arsenious acid (oxide of arsenic, the white arsenic of the shops, and of the *London Pharmacopœia*) has the following properties: it occurs in compact masses of various sizes, which are externally colourless and opaque, but internally, when recently broken, frequently yellowish and transparent, and of a glassy appearance and fracture; by exposure to the air the transparency is lost; the density of the opaque kind is 3.706, and that of the glassy 3.699. Arsenious acid is volatilized at 380° Fahrenheit; the vapour has not the garlic smell, like that of metallic arsenic. According to Dr. Christison, arsenious acid has little or no taste; it is well known as a most virulent poison, which does not appear to be the case with the metal. Arsenious acid is soluble in water; at about 60° Fahrenheit it probably dissolves about 1-100th of its weight, and when boiling nearly 1-13th; on cooling to 60°, a considerable portion is deposited in octahedral crystals, so that only about 3-8ths of that taken up remains dissolved; the solution reddens litmus paper but slightly, and though it acts feebly as an acid in this respect, and does not decompose the alkaline carbonates when cold, yet it expels their carbonic acid when they are heated together in solution. The nature of the saline compounds will be presently mentioned.

Arsenic acid, that containing the larger quantity of oxygen, exists in nature much more commonly than the arsenious acid; sometimes it is found combined with lime, and frequently with various metallic oxides, as those of copper, iron, and lead; the arseniates of copper constitute, indeed, a most beautiful and extensive variety of the ores of that metal. Arsenic acid consists of, very nearly, according to Berzelius—

2 atoms of arsenic	$38 \times 2 = 76$	or 1 atom	$= 38$
5 atoms of oxygen	$8 \times 5 = 40$	or $2\frac{1}{2}$ atoms	$= 20$
atomic weight	$= 116$	combining weight	$= 58$

Arsenic acid may be formed artificially by heating either the metal or arsenious acid in nitric acid, or, which is preferred, in a mixture of nitric and muriatic acid; the mixture is to be distilled in a glass retort until it has acquired the consistence of a syrup; afterwards it is to be heated nearly to redness in a platina crucible, until all the nitric acid is expelled. The properties of arsenic acid thus prepared are—that it is of a milk-white colour; it contains no water, but when exposed to the air attracts it until a solution of specific gravity 1.935 is obtained; when water is added to the anhydrous acid it dissolves only a part of it for a long time, leaving a white powder, which is, however, eventually taken up; by evaporation a syrupy liquid of specific gravity 2.55 is obtained, which, when concentrated till the temperature rises to 248°, begins to deposit solid matter. The anhydrous acid has not a very strong taste, but the aqueous solution is extremely sour, acts strongly as an acid on litmus paper, and decomposes alkaline carbonates when cold. It is extremely poisonous. Its salts, termed arseniates, will be mentioned hereafter.

Arsenic and azote do not unite.

Arsenic and hydrogen combine; indeed it is one of the few metals which forms a permanent compound with this gas. Arsenuretted hydrogen may be prepared by fusing equal weights of arsenic and zinc, and dissolving the alloy in muriatic acid; the gas may be received in air jars filled with and inverted in water, in which it is insoluble. The properties of this compound are—that it is gaseous at the usual temperature of the air; but when subjected to intense cold, it is condensed into a limpid liquid resembling æther. The gas has an extremely fetid smell; its specific gravity is 2.695; it is fatal to animals when it forms only 1-10th of the air which they breathe. When exposed to atmospheric air, it is decomposed; metallic arsenic, mixed with some arsenious acid, is deposited, and water is formed. It is composed of 3 volumes of hydrogen gas, and 2 of the vapour of arsenic, condensed into 2 volumes, or

3 atoms of hydrogen	$= 3$
2 atoms of arsenic	$= 76$
atomic weight	$= 79$

There is also a solid compound of arsenic and hydrogen; it is obtained by employing arsenic as the negative conductor, when water is decomposed by electricity; the hydrogen of the water, instead of being evolved, combines with the arsenic, and the compound is detached from the metal in brown-coloured flocks. It is probably composed of 1 atom of hydrogen = 1 + 1 atom of arsenic = 38: its atomic weight is therefore 39.

Arsenic and chlorine combine to form chloride of arsenic. When the metal in powder is thrown into chlorine gas, it burns, owing to the rapidity of the combination; when also a mixture of 1 part of arsenic and 6 parts of perchloride of mercury is distilled, a thick, smoking, colourless liquid condenses in the receiver: it is very volatile, and does not become solid at a low temperature. If water and chloride of arsenic are mixed, both are decomposed, and arsenious and muriatic acids are formed. When heated, chloride of arsenic dissolves sulphur and phosphorus, but they separate on cooling; it combines with oil of turpentine and of olives. Chloride of arsenic is probably composed of—

3 atoms of chlorine	$36 \times 3 = 108$
2 atoms of arsenic	$38 \times 2 = 76$
atomic weight	$= 184$

Another method of preparing chloride of arsenic is, to put 1 part of arsenious acid and 12 parts of sulphuric acid into a retort, heat the mixture nearly to 212°, and then gradually add small fragments of fused common salt; pure chloride of arsenic, which is to be condensed by artificial cold, passes over into the receiver. A little water frequently comes over with the chloride towards the end of the operation, and this hydrated chloride does not mix with, but floats on, the anhydrous chloride first distilled.

Arsenic does not appear to unite with carbon; it combines with bromine, iodine, fluorine, selenium, and phosphorus; but the resulting compounds are not important.

Arsenic and sulphur may be made to combine in four different proportions; two of these sulphurets, and the more important, exist in nature, and these only will be described at any length. The first is the red sulphuret of arsenic, commonly called *realgar*; this is found native in several parts of Europe, and sometimes crystallized. It is of a deep-red colour, brittle, easily reduced to powder, inodorous, tasteless, and insoluble in water: its specific gravity is about 3.338. It may be artificially formed by melting a mixture of arsenic and sulphur in a covered crucible, or the arsenious or arsenic acid may be used. In the latter cases, sulphurous acid is formed and evolved, owing to the oxygen of the acid combining with a portion of the sulphur. In close vessels, it sublimes unchanged. It appears to be poisonous, but less so than arsenious acid. It is sometimes used as a paint, and is composed of—

1 atom of sulphur	$= 16$
1 atom of arsenic	$= 38$
atomic weight	$= 54$

The second is the yellow sulphuret of arsenic, usually called *orpiment*. This sulphuret is also a natural product, occurring rarely crystallized: it is commonly composed of thin plates, which are of a very fine yellow colour, and flexible to a considerable degree: its specific gravity is 3.452. It is insoluble in water, and inodorous. Acids do not dissolve it, but nitric acid and chlorine decompose it. When heated in close vessels, it melts, and then sublimes; when heated in the air, it burns with a pale blue flame, and gives a white smoke, and a smell of sulphurous acid. It may be formed artificially by passing a current of sulphuretted hydrogen gas into a solution of arsenious acid. It is sometimes used as a pigment, and is a sesquisulphuret composed of—

3 atoms of sulphur	$16 \times 3 = 48$
2 atoms of arsenic	$38 \times 2 = 76$
atomic weight	$= 124$

The two other sulphurets of arsenic are unimportant.

Arsenic and metals in general combine with great facility: those which are malleable it renders brittle, and those which are difficult to melt, it renders fusible.

The combination of arsenic with potassium and sodium is attended with the disengagement of much heat. The

resulting arseniurets are decomposed by water, the potassium and sodium are oxidized, while the hydrogen of the water converts the arsenic into the brown arseniuret of hydrogen already noticed.

The metallic arseniurets are not of sufficient importance to require a more minute description.

We have now to notice the salts that contain the arsenious acid, and which are termed *arsenites*.

Arsenite of ammonia may be prepared by dissolving arsenious acid in solution of ammonia. It cannot be obtained in a solid form, for by evaporation the salt is decomposed, ammonia is evolved, and octahedral crystals are obtained, which are mere arsenious acid, without a trace of ammonia.

Arsenite of potash is procured by digesting the acid in a solution of the alkali. By evaporation, a saline mass is left, but no crystals of the salt are formed. This compound is employed in the preparation of arsenite of copper, sometimes called *mineral green*. It is also the basis of the *liquor arsenicalis* of the *London Pharmacopœia*.

Arsenite of soda is prepared as the last mentioned. By evaporation, a viscid mass is obtained; and when the evaporation has been continued till the solution has acquired the consistence of a syrup, small granular crystals are obtained as it cools.

Arsenite of lime may be readily procured by mixing an aqueous solution of the acid with lime water; the arsenite being nearly insoluble in water, is precipitated in the state of a white powder: it contains water, is soluble in acids, and even in some saline solutions.

Arsenite of barytes is a white powder, slightly soluble in water.

Arsenite of strontia is soluble in water.

The *metallic arsenites*, strictly so termed, are not in general an important class of salts. We shall notice only two of them.

Arsenite of copper.—This compound was first prepared by Scheele, and by him proposed as a pigment; and it has been long and extensively used as such, under the name of *mineral green*. It is formed by adding a solution of arsenite of potash to one of bipsulphate of copper (blue vitriol). By double decomposition, arsenite of copper is formed, and is precipitated of a fine green colour. The exact composition has not been determined: indeed, it is probable that more than one compound may be formed, or one may be mixed with variable quantities of hydrate of copper.

Arsenite of silver may be made by mixing a solution of nitrate of silver with one of arsenite of ammonia, potash, or soda. It is of a fine yellow colour; and the soluble salts of silver, like those of copper, are occasionally used to afford corroborative evidence in cases of poisoning by arsenic.

The *arsenates* are in several cases presented to us by nature. Thus, in Cornwall, arseniate of iron occurs in small green cubic crystals, and also several beautiful varieties of arseniate of copper. Arseniate of lime, called *pharmacolite* by mineralogists, is sometimes, though rarely, met with.

The alkaline and earthy arseniates are generally procured either by direct combination or by double decomposition; and the metallic arseniates usually, if not always, by the latter method. We shall describe the arseniates in the same order as the arsenites.

Arseniate of ammonia.—This salt is prepared by adding the alkali to a rather concentrated solution of the acid, until a precipitate appears. If this and the solution be exposed to spontaneous evaporation, large rhombic crystals are obtained. These crystals, when exposed to the air, lose half of their base, and are converted into *biarseniate of ammonia*. When subjected to distillation, the arseniate of ammonia decomposes as it becomes dry, ammonia, water, and azotic gas, are obtained, and the arsenic is reduced.

The *biarseniate of ammonia* may not only be obtained, as above-mentioned, by exposing the neutral salt to the air, but also by adding acid to it. By slow evaporation, large octahedral crystals are formed: when heated, it yields arsenious acid, but no ammonia.

Arseniate of potash.—It may be procured by saturating the acid with the alkali. It is an uncrystallizable deliquescent mass, and may also be obtained by fusing a mixture of arsenious acid and hydrate of potash. The arsenious acid acquires oxygen from the decomposed water, hydrogen gas being evolved, and sometimes a portion of the arsenious acid is reduced.

Biarseniate of potash may be formed by adding arsenious

acid to the neutral arseniate. It is usually prepared by heating a mixture of arsenious acid and nitrate of potash. The nitric acid yields oxygen to the arsenious, so as to convert it into arsenic acid, which uniting with the potash, the biarseniate is formed. The mass, when dissolved in hot water, yields transparent crystals of the salt. The solution reddens litmus paper, showing the excess of acid. The salt suffers no change by exposure to the air: its taste is cooling and saline, somewhat like that of nitrate of potash. It consists of two atoms of arsenic acid, and one atom of potash. The crystals contain water.

The *arseniate* and *biarseniate of soda* are crystallizable salts, but which do not require any particular notice. The *earthy arseniates* are not of importance.

Arseniate of barytes and *arseniate of strontia* are both soluble salts: they are entirely artificial compounds, and applied to no use. With respect to the metallic arseniates, we have already stated that the arseniates of iron and copper occur in Cornwall: they may also be formed artificially. The *arseniate of silver* is of a brick-red colour, while, as already noticed, the *arsenite* is yellow. Some use is made of this difference in processes for detecting the presence of arsenic. Most metallic arseniates are insoluble in water, but dissolved by acids. As to the general properties of arsenical acids and salts, we shall merely remark that both the acids are precipitated yellow by sulphuretted hydrogen: the arsenites are precipitated yellow by the salts of silver, and green by those of copper; while the arseniates are thrown down red by the silver salts, and blue by the copper ones.

ARSENIC, DETECTION OF. Of all substances, arsenic is that which has most frequently occasioned death by poisoning, both by accident and design; we shall therefore briefly state the methods of ascertaining its presence.

Supposing a white powder to have been found under suspicious circumstances, the process to which it is to be subjected is that of reduction to the metallic state and sublimation, and for this purpose we employ a small glass tube, a spirit lamp and black flux, or fresh burnt and powdered charcoal. The tube should be thin, closed at one end, about one-fourth of an inch in diameter, and three to four inches long; those known by the name of *test tubes* answer the purpose extremely well. Black flux is a mixture of charcoal and carbonate of potash, prepared by deflagrating two parts of bitartrate of potash and one part of nitrate in a crucible. It is to be powdered, and immediately put into a well-stopped bottle to prevent its acquiring moisture from the air; the charcoal which it contains is derived from the decomposition of the tartaric acid, and the potash from that of the bitartrate and nitrate. Mix a small portion, a grain or two, or even less, of the suspected powder with twice its quantity of the black flux, and convey the mixture to the bottom of the tube by means of a trough of smooth writing paper, taking care that none remain adhering to the sides of the tube. Put a paper plug loosely into the tube, and twist a piece of paper round the upper end of it, to serve as a handle; then expose the mixture to the flame of the spirit lamp. The potash of the flux retains the arsenious acid until it is sufficiently heated to be decomposed by the charcoal. If the quantity of arsenious acid be extremely small, then it is better to drop it into the tube, and to let fall a little powdered charcoal upon it. In a very short time the charcoal combining with the oxygen of the arsenious acid, the reduced metal rises in vapour, and condenses in the upper and cool part of the tube; it has a metallic appearance, and is of a brilliant dark steel-grey colour.

Although this effect may be regarded as evidence of the presence of arsenic, Dr. Turner has improved upon it by showing that the metal may be easily re-converted to arsenious acid, and exhibit the characteristic form and properties of that substance, although its weight may not exceed one-hundredth of a grain. This change is effected by holding that part of the tube which contains the arsenic about three-fourths of an inch above a very small flame of the spirit lamp; the metal again sublimes, re-combines with the oxygen of the air in the tube, and well-defined crystals of arsenious acid are formed.

If no solid arsenious acid should be found, but is suspected to exist in solution, either in the food or in the contents of the stomach, then a solution of sulphuretted hydrogen should be added to the suspected fluid, or a current of the gas should be passed into it. This gas is very easily procured by heating powdered sulphuret of antimony and

muric acid in a flask furnished with a bent tube; or sulphuret of iron may be formed by melting in a crucible a mixture of equal weights of sulphur and iron filings; this sulphuret may be decomposed by diluted sulphuric acid, without heating the mixture. By the action of sulphuretted hydrogen on the arsenious acid a yellow solution is first formed, and by heat, or after exposure to the air, the excess of sulphuretted hydrogen is got rid of, and yellow sulphuret of arsenic is thrown down; this is to be collected, dried, heated in the tube with black flux, and metallic arsenic will sublime, as already described. The same treatment may be adopted with any substance which may be suspected to be either yellow or red sulphuret of arsenic (orpiment or realgar), supposing them to have occasioned poisoning.

If the suspected liquid be tolerably free from colour, then various fluid tests may be used to prove the presence of arsenic previous to the process of reduction just described; many of these tests have been proposed, but there are two only which require particular notice: these are the ammoniuret of copper and the ammoniuret of silver. The former is prepared by adding a solution of bipersulphate of copper (blue vitriol) to one of ammonia, nearly as long as the alkali continues to re-dissolve the oxide of copper at first precipitated; this compound is of a well-known azure-blue colour, and when mixed with a solution of arsenious acid, a green precipitate is formed, which is arsenite of copper. It is to be observed that arsenious acid, added to a solution of bipersulphate of copper, occasions no precipitate; it is requisite either that the arsenious acid should be combined with an alkali, or the oxide of copper with ammonia, and the use of the latter, which is in fact the ammoniuret of copper, is probably the best process.

Ammoniuret of silver is prepared by adding a pretty strong solution of nitrate of silver to a solution of ammonia, taking care that the ammonia is but slightly in excess; this ammoniuret is colourless, and when added to a solution of arsenious acid in water, a yellow precipitate is formed, which is arsenite of silver, and which becomes dark brown by exposure to light.

In the above methods of using sulphuretted hydrogen and the copper and silver tests, but little ambiguity can arise. It is, however, well known that the salts of cadmium give a yellow precipitate with sulphuretted hydrogen; but these can scarcely be confounded with or mistaken for a mere aqueous solution of arsenious acid. The ammoniuret of copper will also turn green when added to a yellow solution of most substances; there are, however, but few bodies which, when merely dissolved in water, will give a green precipitate with this test; the silver test may, under peculiar circumstances, give a precipitate with muriatic acid and muriatic salts; this, however, is colourless, and insoluble in nitric acid. If, therefore, any chloride of silver should have been thrown down with the arsenite, so as to mask the properties of the latter by diluting its yellow tint, add nitric acid to the suspected mixture of chloride and arsenite of silver; the former will remain unacted upon, while the latter will be dissolved, and may, by the cautious addition of ammonia to the nitric solution, be precipitated of its characteristic yellow colour.

It is to be understood that the arsenite of copper and of silver, obtained in the above-mentioned experiments, may, after drying, be reduced by the black flux in the mode already described.

It is to be observed that sulphuretted hydrogen does not precipitate arsenious acid when it is dissolved in alkali, as potash or soda; but on adding a little acetic acid, so as to saturate or supersaturate the alkali, precipitation readily occurs.

Arsenic acid and arseniates have been but rarely taken either by accident or design: sulphuretted hydrogen throws down from a solution of the former yellow sulphuret of arsenic, as with arsenious acid; but with ammoniuret of silver it gives a peculiar reddish precipitate of arseniate of silver, which may be reduced in the tube already mentioned, by means of black flux. The biarsenates give immediately arseniate of silver on the addition of the ammoniuret of silver; but the neutral arseniates require a little acetic acid to produce this effect.

ARSENIC, MEDICAL USES OF. As metallic arsenic has no effect upon the human system, we will confine our observations to the employment and mode of action of the white oxide or arsenious acid, and its compound, the

arsenite of potash. The characters of arsenious acid have been given above, but one remarkable circumstance connected with these requires to be noticed here: the degree of solubility depends on the degree of transparency or opacity of the specimen or portion employed. For example, 1000 parts of boiling water dissolve 97 parts of the transparent acid, retaining only 18 parts when cold; but an equal quantity of water will dissolve 115 parts of the opaque variety, and retain 29 parts when cold, the remaining parts being precipitated. It is manifest, therefore, that the strength of a solution must vary with the kind of specimen employed.

The precise character of the taste of white arsenic is a matter of dispute; it is generally said to be acrid and corrosive, followed by an impression of sweetness; but Dr. Gordon states, that it is *at first* always sweet, but afterwards somewhat acid. (Gordon, *Dissert. Inaug. de Arsenico*, Edinb. 1814, p. 9; *Edinburgh Medical and Surgical Journal*, vol. xi. p. 134.)

The white oxide of arsenic being so often employed for the destruction of human life, a dread of it exists not only among the unprofessional part of the community, but even among medical men, which has caused it to be less tried, and its modes of action less studied, than most other medicinal agents of the *Materia Medica*. That it labours under a most unjust opprobrium cannot be doubted, for it is not so poisonous as many other articles frequently used, such as prussic acid and strychnia, while its curative influence is certainly very great. If a small quantity, such as $\frac{1}{10}$ th or $\frac{1}{12}$ th of a grain be swallowed, in about a quarter of an hour the individual experiences an agreeable sensation of comfort and warmth about the stomach, which gradually extends itself over the whole of the abdomen. The appetite and thirst are moderately increased, the secretion of urine becomes more abundant, and the evacuations from the intestines often more frequent, and of a pulpy or pappy character. From the intestinal canal the peculiar action propagates itself over the whole system. The heat of the surface is augmented, and the increased temperature is experienced particularly about the forehead and eyebrows, and the skin is bedewed with a breathing perspiration. At the same time an increased strength and frequency of pulse is felt. The whole muscular system acquires energy and elasticity; the involuntary muscles especially become more powerful and vigorous in their action; the respiration is gently accelerated. The nervous system partakes of the impulse communicated to the frame, and the spirits as well as the courage of the individual rise, liveliness and regularity characterizing the whole functions of the system.

That the white oxide of arsenic is a tonic, therefore, is sufficiently clear; and that its employment in such doses as we have stated is not only safe but beneficial, may be satisfactorily proved. Not only are old worn-out horses endowed with new vigour, improved appetite, &c. by its use, but pigeons to which this article is given show greater appetite and liveliness than others without it; and in Upper Styria the peasantry use it as a seasoning with many articles of food, such as cheese.

It will not, we trust, be supposed that, by bringing forward these facts and statements, we desire to lead any one to make a hasty or inconsiderate use of this very powerful agent. We only wish to show that much prejudice exists against it, in order that, when circumstances seem to require its use, medical men may not be deterred from employing it, from ignorance of its qualities, nor have to encounter unnecessary difficulties from the objections of others. That oxide of arsenic may accumulate in the system, or may give rise to slow poisoning, cannot be questioned; but if exhibited in appropriate cases, the morbid state of the system seems to act as an antidote to it, just as it acts as an antidote to the disease, health being the result of their neutralizing power. Every medical practitioner knows what large doses of opium may be given with safety and benefit in tetanus and some other diseases: it has been stated, under **ANTIMONY**, that very large doses of tartrite of antimony can be borne in certain states of the system; and in the West Indies, during the state of insensibility following the bite of a snake called the *coluber carinatus*, eight grains of the white oxide of arsenic and eighty drops of tincture of opium have been given in the course of four hours, that is, one grain every half hour, with the best effect. (See Paper by Mr. Ireland, in *Medico-Chir. Trans.*, vol. ii. p. 393.)

White oxide of arsenic is not often given in the solid form, nor, owing to its variable solubility, is the solution frequently employed: the form most generally chosen is that of its combination with potass, or arsenite of potass; which is the basis of the *liquor arsenicalis* of the London Pharmacopœia, in the preparation of which the quantity of potass is scarcely sufficient to saturate the whole of the acid, some of which must consequently remain free in solution, or be deposited. Before the regular introduction of this into medical practice, it had long been employed in Lincolnshire for the cure of intermittents, under the name of the *Tasteless Agus Drops*; and from having been introduced into practice by Dr. Fowler, it is frequently called *Fowler's Solution*. It is never given in larger quantity than three or five drops, and should always be taken about half an hour after a meal, to prevent it coming into direct or immediate contact with the inner coat of the stomach.

Being considered eminently an anti-periodic [see AGUS, vol. i. p. 226], it has been used in most diseases which partake of a periodic character; the chief of these we shall here notice, along with two or three others not possessed of a periodic character. It is most frequently employed in intermittent fevers: the greatest advantage is derived from it in the tertian and quartan forms, the quotidian often resisting this and all other remedies. Its beneficial effects may be increased by giving calomel first; cinchona bark may be given also during the employment of arsenical medicines, but it should rather be alternated with them than given at the same time; certainly they should not be given in the same formula or prescription, though, if the patient be very weak, other tonics may be given along with them. Opium is sometimes advantageously given along with them, but it should be employed in very small quantity.

It has sometimes been given in remittents, which approached nearly to the character of intermittents.

In rheumatic cases it has been used, and is most successful when the pains are markedly periodic, or true to a particular hour in their return. It is equally applicable whether these be general or local, as in some rheumatic affections of the eye. (See Travers *On Diseases of the Eye*.) In nodosities of the bones from rheumatism it is also very valuable.

In some affections, more especially of the nervous system, such as *tic douloureux*, and other neuralgic pains, it is useful. In *cardialgia*, or heartburn, when chronic, if combined with belladonna, it often affords speedy and lasting relief. It has sometimes been advantageously employed in hooping-cough, angina pectoris, epilepsy, and chorea, when tonics were required. In some chronic nervous affections of the mental faculties it has been found useful, such as melancholia and hypochondriasis. And in hydrophobia, tetanus, and the bites of serpents, it is certainly more valuable than any other means we are acquainted with.

In cancer it has been employed both internally and externally; the form generally used in the latter way is the *pâte arsenicale*, but it is not free from danger, and requires great caution. Its internal employment has been mostly in cases where it depends upon constitutional rather than local causes; but if hectic fever be present, it will do more harm than good. It seems to be of more service in cancer of the lip and face than in affections of the glands, as the mammae or testicles. In cutaneous diseases, such as lepra and elephantiasis, it is often serviceable, and its beneficial action may be increased by giving *liquor potassæ* along with it.

We hold that the previous failure of other and more common remedies is a sufficient justification of the employment, with due caution, of arsenic in any of these diseases.

In case of an over-dose, or of intentional poisoning by arsenic, it is proper that we should indicate an antidote, and point out the mode of treating such a casualty. Both these are difficult. First then, in the case of a substance so sparingly soluble, we cannot see how the stomach-pump is likely to be of service; more especially as the white oxide either adheres firmly to the inner coat of the stomach, or gets imbedded in its substance. A more rational plan is to give a large quantity of lime-water, cold, as the arsenite of lime is almost insoluble, and nearly inert. After that, an emetic of sulphate of zinc (3 i in a pint of distilled water); then copious draughts of oil (castor oil if possible) or milk. After which the case must be treated on general principles. [See ANTIDOTES, POISONS.]

ARSENICAL MINERALS. Those minerals in which arsenic acts the part of the electro-negative element may be

considered as forming a mineralogical family or class, according to the new chemical arrangement of Berzelius. This family comprehends four genera, a tabular view of the principal species of each of which is here given:—

First genus.

Species. Metallic, or native arsenic.

Second genus (metallic arsenurets).

First species. Octahedral cobalt pyrites: speiskobalt of the Germans.

Second species. Hexahedral cobalt pyrites: kobaltglanz.

Third species. Copper nickel arsenuret of nickel: prismatic nickel pyrites.

Fourth species. Arsenical silver: octahedral antimony of Jameson: silberspeisglanz of Hausmann: antimonial silver of Phillips.

Fifth species. Arsenuret of bismuth.

Sixth species. Axotomous arsenical pyrites (Mohs).

Seventh species. Prismatic arsenical pyrites (Mohs) mispickel (Phillips): arsenikkies.

Third genus.

Species. White arsenic, or arsenious acid.

Fourth genus (compounds of arsenic acid).

First species. Pharmacolite: arseniate of lime.

Second species. Cobalt bloom.

Third species. Nickel ochre.

Fourth species. Scorodite: martial arseniate of copper from Cornwall.

Fifth species. Olivenite: of this there are two species, the one crystallized in the right, the other in the oblique, prismatic system.

Sixth species. Euchlore mica (Mohs): rhombohedral arseniate of copper (Phillips): kupferglimmer.

Seventh species. Cube ore: hexahedral lironite: arseniate of iron.

Eighth species. Rhombohedral lead spar.

In addition to the minerals classed in the above genera, several other substances contain arsenic, acting, however, as the electro-positive element; consequently such compounds do not obtain a place here: of these there are but two particularly worthy of our attention, namely, orpiment and realgar, both of which are sulphurets of arsenic in definite, but different proportions. These minerals, a more particular description of which will be found in their proper place, are obtained of great purity from China and Persia, and afford a valuable and beautiful pigment.

The geological position of arsenical minerals is confined to primitive districts, where they occur in metalliferous veins, usually associated with metallic sulphurets, to which the arsenurets have considerable analogy. The only genus which has been found in any quantity is the second, the most abundant species of which are the arsenurets of cobalt, nickel, and iron, which are found both in veins and beds. The fourth genus appears to owe its origin to the action of the atmosphere on the arsenurets; they occur frequently in union with the phosphates, with which they are isomorphous; consequently the phosphoric acid is frequently more or less replaced by the arsenic, or the reverse.

The arsenic contained in any mineral may, in general, be readily detected by the blow-pipe, owing to the characteristic odour of the vapour of metallic arsenic. In performing this operation it is necessary to be careful to submit the mineral to the interior or deoxidizing flame, or, in order to ensure the reduction of the metal more completely, it is advisable to add a small quantity of the powder of charcoal: this reduction to the metallic state is essential, for it is the vapour not of the white, but only of the metallic arsenic, which possesses the peculiar smell of garlic. If the mineral be from its colour suspected to be orpiment or realgar, it must be mixed with a small quantity of black flux in a glass matrass and heated in the flame of a spirit lamp, by which the arsenic will be liberated, and a sulphuret of potassium formed.

Native arsenic is usually found in veins, accompanied by sulphur and sulphurets; it occurs massive, also in reticulated and stalactitic shapes, and of a curved lamellar composition, exceedingly like the layers of an onion. When fractured, the new surface presents a metallic lustre and a tin white colour, which, however, soon tarnishes, becoming a very dark gray. It is brittle, has the specific gravity 5.766, and its hardness is 3.5.

According to Mohs, it is frequently met with in the mines of Annaberg, Schneeberg, Marienberg, and Freiberg in Saxony; at Joachimsthal in Bohemia, at Andreasberg

in the Harz, in the Black Forest, in Alsace, at Allemont in Dauphiny, at Kongsberg in Norway, at Kapnik in Transylvania, and in beds at Orawitz in the Bannat of Temeswar.

The second genus presents us with a very valuable series of minerals, owing to properties of the metals with which the arsenic is combined. The first three species will be described under the heads of COBALT PYRITES and COPPER NICKEL. The arsenical silver, which constitutes the fourth species, has not been sufficiently investigated. Professor Hausmann considers it as a more or less intimate mixture of prismatic arsenical pyrites with antimonial silver, a compound, according to Klaproth, of 16 to 24 parts of antimony and 84 to 76 of silver. The same chemist states 96 parts of arsenical silver to contain of

Arsenic	35
Antimony	4
Silver	12.75
Iron	44.25

Many mineralogists, on the other hand, consider the antimonial and the arsenical silver varieties of the same species. The first of these occurs in crystals and in granular masses; the latter possesses a curved lamellar composition of thin crystalline plates. They both readily tarnish, and assume a dark gray colour. The specific gravity has been stated by Häuy at 9.446, by Klaproth at 9.82. The antimonial silver is found in veins at Altwolbach in Fürstenberg, and at Andreasberg in the Harz; the arsenical in various mines in the Harz, at Guadalcanal in Spain, and also in Herland mine, Cornwall, &c. It is scarcely necessary to mention that this mineral, when found in sufficient quantity, is highly valuable for metallurgic purposes.

Axotomous arsenical pyrites is a compound of arsenic and iron, occurring in beds of prismatic iron, and also in primitive mountains, accompanied by cobalt and nickel, at Schladning in Styria. Its specific gravity is 7.228.

Prismatic arsenical pyrites, described by some mineralogists under the name of mispickel, is composed, according to the analysis of Stromeyer, of

Iron	36.04
Arsenic	42.88
Sulphur	21.08

Berzelius considers it to be a definite chemical compound, expressed by the following formula:—

on the supposition that the atomic weight of arsenic is 37.7, and in his own notation.

This mineral possesses a tin-white colour and a metallic lustre. The specific gravity is 6.127, and its hardness 6. It occurs massive, and also crystallized in the system of the right rhombic prism; crystals are seen in many modifications of this system; they admit of cleavage in planes parallel to the faces of a prism, whose angles are $111^{\circ} 12'$ and $68^{\circ} 48'$, which may, therefore, be considered as the fundamental form.

This mineral is found commonly in most of the localities of arsenical minerals, associated with ores of silver, lead, and tin, both in veins and beds. It is a product of almost every mine of Cornwall, as well as those of Saxony, &c. Some specimens contain silver, of which the principal are found at Braunsdorf near Freiberg, in veins of quartz, traversing mica-slate.

White arsenic, which constitutes the third genus, is found crystallized in octahedrons, and also in botryoidal and stalactitic forms, frequently pulverulent. It occurs in metallic veins, and probably is the product of the decomposition of other minerals. The lustre is vitreous, and colour white, with a slight degree of transparency. Its specific gravity is 3.698. It is readily recognised by its behaviour in the blow-pipe: if alone, being volatilized; if on charcoal, being volatilized with the production of the garlic odour.

The general characters of the fourth genus have already been given; the species will be described in their alphabetical order.

ARSENIUS, the son of Michael Apostolius, a Greek man of letters of the fifteenth century, who, being exiled from Greece, fled to Italy, where he enjoyed for some time the patronage of Cardinal Bessarion. Having lost his favour, he went to Crete, and gained his livelihood as a transcriber of manuscripts. Arsenius was born in that island towards the close of the fifteenth century. He lived at Rome in the pontificate of Leo X., who made him archbishop of Malvasia, or Monembasia, a town on the eastern coast of the

Morea, not very far from the promontory of St. Angelo. He published a collection of Greek apophthegms of remarkable men. (*Præclara Dicta Philosophorum, Imperatorum, ac Poetarum, ab Arsenio Monembasæ Archiepiscopo collecta*. Rom. 1523. Calliergi.) He also published Scholia on the first seven plays of Euripides, taken partly from Moschopulus, Lascaris, and Thomas Magister—partly from earlier sources. Venet. 1534. This work was dedicated to Pope Paul III., whose friendship he possessed. The dates of his birth and death do not appear to be known. Having become a member of the Roman, he was excommunicated by the Greek church, and his cretulous countrymen believed that his dead body was taken possession of and animated by a demon. [Fabric. *Bibl. Gr.*, vol. i., p. 655, 6; vol. x., p. 222 and 491, &c. See Bayle also.]

ARSINOË, a daughter of Ptolemy I., son of Lagus, king of Egypt, and of Berenice, was married to Lysimachus, king of Thrace, then so far advanced in years that his eldest son, Agathocles, had already espoused Lysandra, the half-sister of Arsinoë. This marriage was by no means a source of happiness to Lysimachus. Arsinoë, fearing lest her children should be exposed to the violence of Agathocles on the death of her husband, prevailed on him to consent to the death of Agathocles, and Lysimachus found himself involved in war with Seleucus in consequence of this atrocious proceeding. One report was, that Arsinoë caused Agathocles to be put to death, because he had declined her proposals. (Pausan. i. 10. Justin. xvii. 1.) Lysimachus fell in battle in Asia, and his kingdom of Macedonia was taken possession of by Seleucus. Seven months afterwards Seleucus was assassinated by Ptolemy Ceraunus, the elder brother of Ptolemy Philadelphus, who also treacherously put to death the two children of his half-sister, Arsinoë, after he had inveigled her into a marriage with him. Their mother he banished to the island of Samothrace. (Justin, xxiv. 3.) So far is Justin's story. Arsinoë would appear to have remained at Samothrace till she was summoned to Egypt, to become the second wife of her brother, Ptolemy II. Philadelphus, king of that country, who reigned from B.C. 284 to 246. This was the first example of an unnatural custom which prevailed among the Greek kings of Egypt, the origin of which it is difficult to account for. Though Arsinoë was now far advanced in years, she was much beloved

[Brit. Mus. Gold.]

by her brother, and he called one of the districts of Egypt by her name. The architect Dinocrates was employed by Ptolemy to erect a temple to her honour, and he intended it should be arched with loadstones, so that her statue, made of iron, might have the appearance of being suspended in the air. The death of the architect prevented its completion. We thus find that the Mohammedans of Medina were not the first to whom this strange idea had occurred. (Plin. xxxiv. 14.)

Strabo (x. 460) attributes to this Arsinoë the founding of a city called by her own name on the banks of the Achelous, in Ætolia. (See Steph. Byzant.) This fact, if true, will tend to confirm the opinion of the Arsinoë, the wife of Lysimachus, being afterwards the wife of Ptolemy Philadelphus; the strange adventures of her life, and the confusion in this period of history, render it very difficult to believe all the history of Arsinoë, as it is given by the various authorities.

A statue of Arsinoë existed at Athens in the time of Pausanias (i. 8). The beautiful medal of Arsinoë, which we have given, with a cornucopia on the reverse, confirms what Athenæus says (xi. chap. 13), 'that the kind of cup or drinking vessel called Rhuton (ῥυτον) was first devised by Ptolemy Philadelphus as an ornament for the statues of Arsinoë; which had in the left hand a cup of this kind filled with the fruits of the earth, by which was indicated that this horn is more fertile than that of Amalthæa.'

ARSINOË, a daughter of Lysimachus, king of Thrace, was the first wife of Ptolemy Philadelphus (according to the opinion of some critics), by whom she had three children,

section of the same statute, setting fire to coal-mines is also declared to be a capital felony; and by the 17th section it is further enacted, 'That if any person shall unlawfully and maliciously set fire to any stack of corn, grain, pulse, straw, hay, or wood, every such offender shall be guilty of a capital felony; and if any person shall unlawfully and maliciously set fire to any crop of corn, grain, or pulse, whether standing or cut down, or to any part of a wood, coppice, or plantation of trees, or to any heath, gorse, furze, or fern, wheresoever the same may be growing, every such offender shall be guilty of felony, and be liable to be transported for the term of seven years, or to be imprisoned for any term not exceeding two years, and, if a male, to be whipped, in addition to such punishment.' The firing must in all cases be wilful and malicious, in order to constitute the crime of arson; but it is not necessary that an intent to injure or defraud should be expressly proved by evidence, as the malicious design may be inferred from such circumstances as obviously point to such an intention; nor is it any defence to a charge of arson to show that the accused had no particular malice towards the owner of the property. The burning of a man's own house, if it be situate in a town, or so near to other houses as to endanger them, is a misdemeanor at common law, punishable with fine and imprisonment.

ART AND PART is a term used in Scotch law to denote the charge of contriving a criminal design, as well as that of participating in the actual perpetration of the criminal fact. The derivation of the phrase is uncertain. Sir George Mackenzie, in his *Discourse upon the Laws and Customs of Scotland in matters Criminal*, says, that 'by art is meant that the crime was contrived by the art or skill of the accused (*eorum arte*); and that by part is meant, that they were sharers in the crime committed, et quorum pars magna fui.' By other writers it has been considered as an abbreviation of the Latin phrase of *artifex et particeps*. It is a charge of very extensive meaning, comprehending not only the offence of accessories before and after the fact according to the English law, and the *ope et consilio* of the Roman law, but also all interference and assistance at the time of the commission of the criminal act. By an ancient Scotch statute, passed in 1592, it is required that in all criminal libels or indictments, the offenders shall be charged as having committed the imputed offence 'art and part.' This enactment was occasioned, as its preamble intimates, by the frequent instances of failure of justice in criminal trials, in consequence of a variance between the evidence and the particulars detailed in the libel or indictment. Thus, previously to the statute, if A and B were charged with murder, and the indictment stated that A held the deceased while B stabbed him, and it appeared in evidence that the facts were reversed, and that B held him while A stabbed him, neither of the accused persons could be convicted. But by the insertion of the charge of 'art and part,' such a failure of justice could not occur; for, in fact, both the panels, or prisoners, are substantially guilty 'art and part,' and are therefore comprehended in the general charge of the indictment. This subject is very copiously discussed in Hume's *Commentaries on the Law of Scotland respecting the Description and Punishment of Crimes*.

ARTÁ, GULF OF (the Ἀρτακικός κόλπος of the Greek and the Ambracius Sinus of Latin authors), is an arm of the Ionian Sea, between the antient Epirus and Acarnania, and now the boundary between the Turkish province of Albania and the kingdom of Greece. It is twenty-five miles long and ten wide, and is contained between the parallels of 38° 52' and 39° 3' N., and the meridians of 20° 43' and 21° 10' E. of Greenwich.

Across the entrance is a bar composed of soft sand and sea-weed, over which the greatest depth of water is fifteen feet, and the channel is intricate. Having passed this, the gulf is navigable for vessels of the largest size, and is perfectly free from danger, except off the low shores, where flats extend in some places nearly a mile: but these may be distinguished by the light colour of the water; the banks being of white sand, while in the rest of the gulf the bottom is of black mud. The deepest water is thirty-six fathoms, which is towards the head of the gulf. The narrowest part of the entrance is only 700 yards, and half a mile is its general width in the direction of N.E.; it then turns sharply round a low point to the S.E., and opens out much wider for about four miles, the western shore being low and the eastern high. A second entrance is then formed by the two high capes of La Scara and Madonna to the large basin of the gulf, the northern shore of which consists of low sandy ribands, separating large lakes and marshes from the gulf. At the distance of eight or nine miles to the northward of the gulf, a sharp and uneven range of hills runs about east and west; the westernmost part of which, overlooking the Ionian Sea, called Mount Zalunga, is about 1500 feet in height, and continues its undulating descent to the ruins of Nicopolis, three miles north of Prevesa. After a considerable depression, the eastern part of the range rises again to a remarkable three-peaked mountain, called from its colour Mavro Vouno (Black Mountain), which has about the same elevation as Zalunga, but its sides are rugged and precipitous. Between its foot and the lakes before-mentioned, lie the plains of Arta, rich and fertile; but, from the thinness of population and want of commerce, they are little cultivated, and principally devoted to pasture. Farther to the N.E. are ranges of hills connected with the chain of Pindus. To the eastward, and directly on the coast of the gulf, rises the Makronoro ridge, about 250 feet in height, along which runs the road from Albania into Greece: this road is capable of being strongly defended, and particularly at the bottom of Karavassara Bay, where the hills scarcely admit a passage between their bases and the gulf. The southern shore is generally rocky except at the bottom of the bays formed by its irregular line; the hills are round-topped, insulated, and barren, composed principally of limestone and schist, with occasional broad veins of quartz; they descend steeply to the shore. One of these, to the eastward of Vionitza, called Amuthero, rises to the height of 1500 feet. The western shore, from Cape La Scara northwards towards Lake Mazoma, is first rocky and steep; then come grassy cliffs, with a narrow shingly beach at the foot, and lastly, the hills slope gradually down to a low shore.

The only towns on the shores of the gulf are, Prevesa, on the northern side of the entrance, and Vionitza, at the bottom of a bay of the same name on the southern shore. The town of Arta, whence the Gulf derives its appellation, is seven miles from the north coast. At Salahora, which is the port of Arta, there is a custom-house, and there is one also in Karavassara and Loutraki bays. The only village is that of Korakonissi; at Vlica, Arapi, and Karavassara, there are also a few huts.

The ruins of Argos Amphiloichium are now visible at the bottom of Karavassara Bay, in the Gulf of Arta. They are of Cyclopien masonry, situated on a steep acclivity 350 feet high, near the sea. The town which occupied the summit was encircled by walls, and these were tangented by two others, descending the hill and meeting at an angle within a few feet of the beach. The high road from Albania into Greece winds round this angle through a deep ravine commanded by the town, which thus offers a very strong military position.

There is a custom-house, and a few huts near the ruins, known by the name Karavassara. 38° 51' N. lat., 21° 10' long. East of Greenwich.

Two rivers, the Luro (antient Charadrus) and the Arta (antient Arachthus), flow into the gulf on its northern shores; both are navigable for boats, seven or eight miles from their mouths. A small stream also flows through the town of Vionitza, affording an abundant supply of excellent water.

The gulf abounds in fish of the finest quality, particularly of the mullet kind; there are also soles, eels, and sardines, and very large prawns. The sardine fishing is generally farmed from the Greek government of Vionitza, whose only right, however, is their naval superiority, by parties of Sici-

lians, who salt them down in barrels from the nets; but the other fish are taken in fisheries constructed of reeds closely placed in the ground, forming a sort of labyrinth, which terminates in a death-chamber, whence they are taken at pleasure by a hand-net.

The commerce of the gulf is very unimportant and all carried on in small vessels; occasional cargoes of corn and cattle to the Ionian Islands, the vallonæ, an acorn used for dyeing articles of dress and leather manufactured at Arta, with the exchange of market supplies, constitute the whole trade.

Small veins of coal have been discovered near the convent of Santi Apostoli, on the western side of the gulf, and the rocks bear strong indication of the presence of copper.

There is a rise and fall of about two feet; but this, with the velocity and direction of the current, are much influenced by the wind, so that it cannot be considered as a regular tide. This remark, indeed, applies to the entrance of the gulf more immediately: with the sea-breeze which blows from the westward the current sets to the eastward into the gulf, and in the night, when that power fails, the water returns out of the gulf.

ARTA, the ancient Ambracia, a town of Albania, is situated on the left bank of the river of the same name, and seven miles in a direct line from the north shore of the Gulf of Arta. It is governed by a bey under the pachalick of Yanina, and prior to the struggle for Grecian freedom was a very large and populous city, but having been stormed in 1828 by the Greeks, under Marco Botzaris, was reduced to a ruinous state.

Hellenic remains of considerable extent may still be seen forming the base of the present walls of the castle, which is situated close to the river in the northern quarter of the town. There are also remains of the lower empire in the convent built by the empress Theodosia, about the year 845 of the Christian æra, and another convent, or cathedral, of the same style, but more recent date. Arta is a bishop's see, and has several Greek churches. In the quarter more particularly set apart for trade, each art has its separate street or bazaar, and articles of dress manufactured here are held in high estimation. The floccatas, or shaggy capotes of Arta, are considered the finest; woollens, coarse cottons, and an inferior though strong description of Russia leather, are also manufactured, and this town derives some commercial benefit as the entrepôt between Yanina and the gulf. Butchers kill and vend their meat outside the town; the market is abundantly supplied with fruit and vegetables from the neighbouring country which is fertile and well cultivated, and the plains abound in cattle and sheep.

Distance is reckoned by time at the average rate of three miles to the hour and eight hours to the day. Arta is two days (or thirty-six miles direct distance) S. $\frac{1}{2}$ E. from Yanina, ten hours (sixteen miles direct) N.E. from Prevesa, and three and a half hours (nine miles direct) N.E. $\frac{1}{4}$ N. from Salahora. The road to the latter place is very good, as it is the more frequent channel of conveyance for merchandise even to Prevesa. The land transportation of goods is by means of horses, as the people have very few camels, and it is not uncommon to meet a cavalcade of fifty to eighty horses thus laden. There is a bridge of Venetian construction over the river Arta, at the town.

[Bridge at Arta.]

Its whole length is about 200 yards, and the height of the centre angle about 100 feet above the river, which is here divided into numerous streams by sand-banks. Arta lies in 39° 8' N. lat. and 20° 59' E. long.

ARTABANUS, the last of the Parthian dynasty of the Arsacids. He succeeded his brother, and reigned in

prosperity until the Emperor Septimius Severus suddenly invaded his dominions and sacked Ctesiphon, his capital. A.D. 199. Caracalla, the son of Severus, injured him more deeply; for having asked and obtained in marriage the daughter of Artabanus, he entered the country with a Roman army, and in the middle of the festivities gave orders for a massacre, A.D. 216, in which numbers of the Parthians perished, and the king himself escaped with difficulty. Indignant at this gross treachery, Artabanus took the field with a numerous army. Caracalla was now dead, having been assassinated on his march between Carrhæ and Edessa, and was succeeded by Macrinus. After a hard-fought and indecisive battle of two days, the Romans came to terms, by informing the Parthian king of the death of Caracalla, against whom he was chiefly incensed, and by restoring the prisoners and booty taken at Ctesiphon. This satisfaction, however, was dearly bought; for it led to the overthrow of the Parthian monarchy. Artaxerxes, otherwise called Ardeshir, took advantage of the losses sustained by the Parthians to incite the Persians to revolt. [See SASSANIDE.] After the revolt had been maintained three years, the king and his rebel subject met, each at the head of a powerful army, and after three days' hard fighting the former was beaten, taken, and put to death, A.D. 229. The Parthians in consequence became subject to the Persians, after having been their masters for 475 years. (Herodian, iii. c. 9; iv. c. 10 to 15; Lives of S. Severus, Caracalla, and Op. Macrinus, in the *Historia Augusta*; Bayle, *Enc. Univ. Hist.* v. xi.)

ARTAXERXES, or ARTOXERXES, a Persian name, and evidently a compound word, *Arta-Xerxes*. Herodotus (vi. 98) interprets it to signify 'a great warrior.' *Arta* very commonly occurs as the first part of many ancient Persian names, such as Arta-banus, Arta-pates, &c. Ammianus Marcellinus (xix. p. 147, ed. Lindenbr. 1603) interprets it as 'conqueror of wars.' We are inclined to consider the root as the syllable *ar*, which appears in many different languages under the form of *er*, *ir*, and *art*, with the addition of *t*, which is not elementary; in all of them it has the idea of courage or strength. *ἄρης*, *Mars*, *vir*, and *Art*, in this Persian word, seem to have the same root. For various opinions on this point, see Herder, *Persopolis*, p. 127; Grotefend, *Beilage zu Heerens Ideen*, i. p. 589; Creuzer, *Symbolik*, i. p. 734; and Pott, *Etymologische Forschungen*, &c. Lemgo, 1833.

I. ARTAXERXES, or ARTOXERXES, surnamed Longimanus (in Greek Macrocheir), from his right hand being larger than his left (Plut. *Artaxerxes*), was the second son of Xerxes I., and succeeded to the throne on the murder of his father and elder brother Darius by Artabanus B.C. 465 or 464. He afterwards narrowly escaped assassination from the same hand, but his superior strength saved him in the struggle, and Artabanus fell by a blow from his dagger. (Compare Ctesias and Diodorus.) During the civil commotions that followed this event, and while the king was engaged in reducing the rebellious province of Bactria, the Egyptians, thinking this a favourable opportunity to recover their independence, of which they had been deprived by Cambyses, rose in arms under Inaros B.C. 460, and nearly freed their country from the yoke of the Persians. They at the same time received a numerous body of Athenian auxiliaries. Artaxerxes employed his uncle Achæmenes or brother (Ctes.) to reduce them to obedience, but he was defeated and slain. (Herodot. iii. 12; vii. 7.) In a second expedition which he sent under Artabazus and Megabyzus he was more successful, and the Athenians found themselves obliged to evacuate the country, B.C. 455, leaving Egypt in the hands of the Persians after an obstinate resistance of six years, during part of which time the Athenians were absolutely in possession of Lower Egypt. The Athenians, however, still continued the war, and sent a body of troops under Cimon to take possession of Cyprus. Cimon defeated the Persians several times, and had nearly reduced the whole of the island when he was cut off by disease B.C. 449. Peace was then concluded on the following conditions:—1. That all the Greek cities of Asia should enjoy full independence. 2. That no Persian ships of war should enter the sea extending from the coasts of Pamphylia as far as the entrance to the Black Sea. 3. That no Persian army should approach within a horseman's day's journey of the Grecian seas (Plut. *Cim.* 13), or three days' journey. (Diod.) 4. That the Athenians should attack none of the possessions of the king of Persia. This peace was con-

cluded the same year that Cimon died (Diod. xii. 4), though some writers have placed it immediately subsequent to the battle at the river Eurymedon, B.C. 466 (Plut. *Cim.* 13.) (See the subject discussed in a note on Diodor. xii. 4, by Wesselingius.) Artaxerxes seems to have spent the remainder of his life in peace: he died after a reign of forty years, B.C. 425 (forty-two, Ctes.), and was succeeded by his son, Xerxes II.

Themistocles, who was obliged to fly from Greece, found safety and an honourable reception at the court of this Artaxerxes in the beginning of his reign. The date commonly assigned to this event (B.C. 466) is either incorrect, or we must place the commencement of Artaxerxes' reign a little earlier. [See THEMISTOCLES.] (See Thucyd. i. 104-110; Diodorus, lib. xi. xii.; Ctesias *Perica in Phot. Bibl.* p. 119; or, Baehr's ed. of Ctesias, 1824.)

II. ARTAXERXES, surnamed Mnemon (Μνήμων) from the excellence of his memory, was the eldest son of Darius II. and Parysatis, and succeeded to the throne on his father's death B.C. 405. His original name was Arsaces, or Arsicas. His younger brother, Cyrus, who founded his right to the crown on his being the first born after the accession of his father (Plut.), conspired against him, and would have been put to death but for the intercession of his mother, who obtained his pardon, and even his continuation in the command of the maritime provinces of Asia Minor. At Sardis he collected a large force with the intention of usurping the throne, and proceeded with these troops and a body of above ten thousand Greek mercenaries to attack the king. This is the celebrated expedition of which Xenophon has left us so interesting an account. [See ANABASIS.] A decisive engagement took place at Cunaxa, about forty miles from Babylon, and the result was the death of Cyrus and the complete establishment of Artaxerxes on the throne, B.C. 401. The part which the Spartans had taken in this expedition was not likely to be overlooked by the king, and a war arose between them. The Lacedæmonians, indeed, were encouraged to enter Asia by the weakness of the Persian monarchy, which the expedition of the 10,000 had revealed to all Greece. After several Spartans had been sent out, Agesilaus was at last appointed to command the Spartan troops in Asia Minor, and his success was equal to the high reputation which he had already acquired. He overran the greater part of the western provinces of Asia Minor, and would probably have reduced the whole of the peninsula, if Artaxerxes by bribery had not succeeded in exciting a Grecian war against Sparta. Agesilaus was recalled to the defence of his country, and the Persians soon afterwards gained a naval victory near Cnidus, principally by the assistance of Conon the Athenian, B.C. 394. The Spartans were at last induced to sign a treaty which gave up everything for which they had been contending, and is known in history as the peace of Antalcidas, from the name of the person who was employed by the Spartans to conclude it, B.C. 387. [See AGESILAUS.] It was to the following effect:—that the Greek cities in Asia and the island of Cyprus should be subject to the king; that all the other Greek states, except Lemnos, Imbros, and Scyros, should be independent. Cyprus, however, did not submit [see EVAGORAS], and it required more than ten years to reduce it to subjection. The only war which Artaxerxes conducted in person was that against the Cadusii, a people inhabiting the mountains on the west and south-west side of the Caspian sea, and in it he exhibited a patience under fatigue which excited the astonishment of his courtiers. The expedition was not successful. He married his own daughters, Amestris and Atossa, the first example that we have in Persian history of such an unnatural alliance. Towards the latter years of his life he put his son Darius to death in consequence of a conspiracy which he had formed against him. Artaxerxes was unsuccessful in his attempts to reduce Egypt. [See AGESILAUS.] He died from grief on account of the bad conduct of Ochus, the youngest of his sons, B.C. 359, at the age of ninety-four (Plut.), and was succeeded by Ochus. (Plutarch's *Life of Artaxerxes*; Diodorus, lib. xiii. xiv.; Ctesias; Xenophon's *Anabasis*.)

III. ARTAXERXES, called Ochus before he ascended the throne, was the third son of Artaxerxes Mnemon. All accounts concur in making him one of the most cruel and sanguinary of the Persian princes. He began his reign by putting to death all those of the royal family from whom he thought himself likely to incur danger. Egypt, which never quietly submitted to the sway of the Persians, was at this

time in revolt, and governed by the last of its native princes Nectanebus II. Artaxerxes led a powerful army against him, and completely broke the strength of Egypt, B.C. 354. His treatment of the Egyptian god, Apis, is said to have proved his destruction, for it excited so much indignation in the mind of Bagoas, his favourite eunuch, an Egyptian by birth, that on the king's return to Persia he murdered him, B.C. 338, and placed on the throne his youngest son, Arsēs. If, however, the date of the Egyptian war, B.C. 354, and the death of Ochus, B.C. 338, are both correct, this story seems to have little foundation. (Diodorus, lib. xvi. xvii.; Justin. x. 3.; Plutarch's *Agēsilaus*.)

ARTEDI, PETER, a distinguished naturalist, the second son of Olaus Artedi, was born 22nd February, 1701, at Anund, in Angermanland, a province of Sweden. Possessing excellent talents and a good memory, he was destined for the church, but after beginning his studies at Normaling, where his father officiated as clergyman, the secret inclination of his heart led him to visit the rich shores of the Bothnian Gulf to study fishes; he also examined plants, chiefly those used in agriculture and domestic economy.

In 1716 he was sent to the school of Hernösand, where, while others spent their hours of relaxation in play, he devoted himself to the study of fishes and the collecting of plants. During his residence here he read many works on alchemy. In 1724 he went to the University of Upsal to study philosophy and theology, but he gradually abandoned these, and at last gave himself up to natural history; from alchemy he turned to chemistry, and ultimately to medicine.

In 1728 Linnæus likewise went to Upsal to study medicine, and on inquiring who among the students was pre-eminent, all answered, Peter Artedi: on which Linnæus sought his acquaintance.

At this time, according to Linnæus's description of him, he was tall, thin, with long black hair, and a countenance resembling that of John Ray, judging by the portrait of the English naturalist. Their friendship continued through the whole period of their residence at Upsal, which was seven years, during which time an honourable rivalry subsisted between them, each abandoning to the other the departments of natural history in which he seemed to excel; in this way the study of fishes and the amphibia was assigned to Artedi, while Linnæus surpassed him in a knowledge of birds and insects. In testimony of their friendship, before the departure of Linnæus for Lapland and of Artedi for England, they mutually constituted each other heir to their papers and collections of natural history, the survivor pledging himself to publish whatever manuscripts might seem worthy of the public eye.

In September, 1734, Artedi sailed from Stockholm to London, where he met with the most courteous reception, particularly from Sir Hans Sloane. During his stay in London he wrote the preface to his *Ichthyologia*.

In 1735 Linnæus, after his Lapland tour, went to Leyden, where, after residing a few weeks, he was agreeably surprised to find himself joined by his friend Artedi. The means of Artedi being now almost exhausted, he meditated a return to his native land; but a very different fate awaited him. Albert Seba, an old and wealthy apothecary of Amsterdam, who had collected an unrivalled museum of objects of natural history, had published two volumes descriptive of quadrupeds and serpents, and when about to publish the third concerning fishes, he requested the assistance of Linnæus; but he, being occupied with other matters, and moreover engaged with Dr. Clifford of Leyden, declined Seba's offer. Linnæus, however, recommended his friend Artedi. Previous to this Artedi assisted Linnæus in his great *Systema Naturæ*, particularly in the departments of fishes, and in the umbelliferous plants, in the arrangement and construction of the genera of which, he recommended the adoption of the involucre as furnishing a good character. Indeed it was the intention of Artedi, after his work on fishes should have been finished, to devote himself entirely to the study of umbelliferous plants. Having entered upon his new office, he drew up for the work of Seba, the descriptions, the synonymes, the genera, and species of nearly all that remained.

About this time, Linnæus, having finished his *Fundamenta Botanica*, hastened to Amsterdam to show it to Artedi, who on his part showed Linnæus his *Philosophia Ichthyologica*, which had been the work of several years labour.

This delightful and advantageous interchange of ideas soon experienced a melancholy interruption; Artedi, on the 21st September, 1735, when returning to his lodgings from the house of Seba, fell into one of the canals of Amsterdam, and no assistance being at hand, he was not discovered till morning. Thus, in the thirtieth year of his age, perished one whom Linnæus justly pronounced an honour and ornament to his country.

Linnæus, in conformity with their testamentary arrangement, claimed his manuscripts; but the landlord, on account of some small debts, refused to give them up, and even threatened to sell them by auction. They were purchased by Dr. Clifford, and by him presented to Linnæus. Among them he found the *Philosophia Ichthyologica* alone finished; the *Synonymologica*, a work of immense labour, complete, but confused; the *Descriptions*, good; the *Bibliotheca*, unfinished; and the *Systema* nearly complete.

Linnæus devoted more than a year to render these works complete, and then gave them to the world, preceded by a well-written life of the author, in 1 vol. 8vo, Leyd. 1738. Linnæus had previously availed himself of them, for the department of fishes, in his *Systema Naturæ*, published at Leyden in 1735.

Cuvier and Valenciennes, in their history of ichthyology, prefixed to their *Histoire Naturelle des Poissons*, Paris, 1828, pronounce this the first work which gave a truly scientific character to the natural history of fishes, completing that which had been so well begun by Willoughby and Ray.

Artedi founded his orders solely upon the consistence of the skeleton, upon the opercula of the gills (branchiæ), and the nature of the rays of the fins. Of these there are four, (for we do not admit the cetacea,) denominated the malacopterygii, the acanthopterygii, the branchiostegii, and the chondropterygii. The branchiostegii, being badly constructed and badly defined, cannot be retained, but the other three are strictly natural, and nothing superior to them has yet been proposed. The genera were sixty-eight, but of these fifty-five only were defined, thirteen being merely indicated in the supplements to the *Genera* and the *Synonymologica*.

genera of Artedi.

I. Malacopterygii.	II. Acanthopterygii.	IV. Chondropterygii.
Syngnathus.	Blennius.	Petromyzon.
Cobitis.	Gobius.	Accipenser.
Cyprinus.	Xiphias.	Squalus.
Clupea.	Scomber.	Raia.
Argentina.	Mugil.	—
Exocoetus.	Sabius.	Genera indicated in the
Coregonus.	Sparus.	Supplements.
Osmorus.	Scimna.	I. In the <i>Genera</i> .
Salmo.	Perca.	Tenia.
Esos.	Trachinus.	Silurus.
Echtheia.	Trigla.	Mustela, phycis.
Coryphæna.	Scorpena.	Sphyrena.
Ammodytes.	Cottus.	II. In the <i>Synonymologica</i> .
Pleuronectes.	Zeus.	Cicla.
Stromateus.	Chætodon.	Hepatus.
Gadus.	Gasterosteus.	Capricus.
Anarhichas.	III. Branchiostegii.	Pholia.
Muraena.	Balistes.	Citharus.
Ophidium.	Ostracion.	Atherina.
Anableps.	Cyclopterus.	Siparis.
Gymnotus.	Sophlus.	Chelon.

In his botanical labours he was not so successful. The involucre of the general umbel and the involucre of the partial umbel (in other words, the general and partial involucre) are merely *bractææ*, on which, in no other case, has it ever been attempted to found generic characters. These parts, indeed, furnish very secondary characters, and an arrangement of umbelliferous plants according to them must be at all times bad, and cannot be retained in the present day, especially since the labours of Koch and Decandolle have furnished one so much superior. (See *Nova Acta Academiæ Cæsareæ Naturæ Curiosorum*, 1824, vol. xii. part 1. p. 55. and Decandolle, *Mémoire sur la Famille des Umbellifères*, Paris, 1829. Decandolle, *Prodromus Systematis Naturalis Regni Vegetabilis*, vol. iv. Umbellifères, p. 55. Paris, 1830.)

Linnæus called a genus of umbelliferous plants after his friend, Artedi, of which only one species is known. *A. squamata*. Artedi's *Ichthyologia* was reprinted and enlarged by J. Waldbaum, three volumes quarto, Lubeck, 1788, 1789, 1792.

ARTEMIDORUS of Ephesus wrote a treatise on general Geography, in eleven books, besides some other works. His era is not precisely known, but he wrote probably about one

century B.C. His geographical work is very often quoted by Strabo as authority, by Pliny in his *Natural History*, by Stephanus of Byzantium in his *Dictionary*, and by other writers. The passages thus quoted are collected in Hudson's *Minor Greek Geographers*, vol. i. We can collect from Strabo that Artemidorus visited Spain, Rome, and Alexandria. He was sent by his citizens on an embassy to Rome, in order to recover two valuable salt lakes near the mouth of the Cayster which belonged to the temple of Diana, but had been seized by the Roman *publicani* (farmers of the taxes). Artemidorus was successful, and was rewarded with a golden statue. (Strabo, xiv. p. 642.)

ARTEMIDORUS, surnamed Daldianus, from Daldia, a city of Lydia, which was his birth-place, is the author of a work in five books, entitled 'Ὀνειροερμηνεία, or, *The Interpretation of Dreams*. He lived in the time of the Antonines; and collected his materials by travelling in Greece, Asia, Italy, and various other countries, and registering such communications as he was favoured with by those who studied the interpretation of dreams. (See Lib. I. cap. i.) The value of the work, which is written in very fair Greek, consists in the strange stories, and in the view which it gives of the superstition about dreams in that age: it is also useful for the explanation of several mythological allusions and symbols. The fifth book, entitled 'Ἀποδείξεις, or 'Results,' is addressed to the author's son: it contains ninety-five short dreams that occurred to different individuals, and the events which followed. Some of the dreams are remarkable as samples of what people's dreams were seventeen centuries ago. The first edition was by Aldus, 1518, 8vo.; the last by Reiff, Leipzig, 1805, 2 vols. 8vo., one of text and the other of notes. An English translation was published in 1644, in 12mo, under the title of 'The Interpretation of Dreams, digested into five books, by that ancient philosopher Artemidorus.' Of this work a tenth edition was published in 1690.

Artemidorus wrote other works besides that which we now have. See Suidas ('Ἀρτεμίδωρος'), and the author's work, Lib. II. cap. i.

ARTEMIS, one of the ancient Greek divinities, known to the Romans as Diana, whose attributes were so numerous and of such opposite kinds, that it is difficult to imagine how they should have been assembled in the same deity, if we did not know that the imaginative spirit of the Greeks loved to invest their gods with the most opposite characters. In the poetry of Homer and Hesiod she appears as the daughter of Jupiter and Leto (Latona), sister of Apollo, and the goddess who presided over hunting. She traverses the woods, armed with the bow and arrow, and attended by numerous nymphs. Her bow is employed, not only against the beasts of the forests, but also against man; and in those early poems she is represented as never yielding to the allurements of love. She is a chaste and pure virgin. In the *Orphic Hymns* (35, 36) we find her invested with other attributes. There she assists at child-birth, is the assuager of pain, looks with benignant eye on the labours of man, and is the author to him of abundant harvests, of peace, and of health. In this she seems to have appropriated to herself part of the duties of Ceres, and indeed, according to Æschylus, she was daughter of that goddess. In a temple at Megalopolis in Arcadia her statue stood by the side of that of Ceres, and she was clothed with the skin of a hind: a quiver hung from her shoulder; she had a lamp in one hand and two serpents in the other. (Pausan. viii. 37.) In the Greek tragic poets she appears under another character, according to which the favour of the goddess must be obtained by the sacrifice of human victims. Iphigenia, daughter of Agamemnon, on her return from the Tauri, introduced this barbarous feature in the worship of Artemis. At Sparta there was a temple of Artemis Orthia, where they exhibited an old wooden statue, said to be that brought by Iphigenia from the Tauri; and though in later times human victims were not offered, the thirst for blood, which the goddess was supposed to feel, was satisfied by the severe scourging of the Spartan youths before her statue. (Pausan. iii. 16.) All these various fables were collected by the Alexandrine poets of later times, and fitted to one another so as to form a whole.

The worship of Artemis was very general throughout Greece and the colonies, but she was more particularly the goddess of the Arcadians, if we may judge from the numerous temples found in that district. There almost every height, fountain, and river, supplied her with a distinctive

epithet, so that the poet Aloman (who flourished probably B.C. 672) says, that she derives names from ten thousand mountains, cities, and rivers. She is Lycoatis on Mount Mœnalis (Paus. viii. 36), Cnakeatis at Tegea (viii. 53), Stymphalia on Stymphalus (22), Cnacalesia and Condyleatis at Caphysæ (23): and it is curious to observe that this old Peloponnesian divinity is frequently found in connection with streams and rivers. She is *amnis dominæ*, 'mistress of rivers,' in Catullus (34, 12); *ἀμνισσὶν ἐπιτοκός*, *inspector* or *superintendent of ports*, in Callimachus (iii. 40).

Artemis was a favourite subject with the artists of Greece, and they have generally represented her as a huntress. They endeavoured to invest her with all the freshness and vigour of youth: in the old style, where she is generally clad in the stola, the artist still contrived to indicate her full and well-formed figure. In the works of Scopas, Praxiteles, and Timotheus, Artemis was, like Apollo, represented of a slender form; her hips and breasts without the fullness of womanhood. The countenance is that of Apollo, only with a softer expression and more full; the hair is sometimes bound over the forehead, but more frequently in a bunch behind or on the top of the head in the manner peculiar to the Dorians. The dress is a Doric vest (*χιτών*), either tucked up high, or reaching to the feet; and the shoes are Cretan. Sometimes a dead or dying stag lies at her feet. See Filhol, *Galérie Napoléon*, v. 366; Visconti, *Iconographie*, xlii. 1; *Diana Lochza* in Millin, *Momuments inédits*, ii. 34. (See this subject treated fully in Müller, *Archäologie der Kunst*, Breslau, 1830.) We have not entered into the question whether there were several goddesses of this name distinct from each other in their character and attributes, but we think that this opinion is by no means improbable. She is considered the same as the Bubastis (Herod. ii. 59) of the Egyptians. (Seyffarth, *Geschichte des alten Egypten*, Leipzig, 1833; Müller, *Die Dörfer* (translation) vol. i.; Vois, *Mythol.* Br. iii. 1. See DIANA, SELENE, and HECATE.)

ARTEMISIA, the daughter of Lygdamis, became queen of Halicarnassus, a city on the coast of Asia Minor, when her husband died. She was one of the most distinguished women of antiquity, if we may credit the account given by her countryman Herodotus. She attended Xerxes in his expedition against Greece B.C. 480, and furnished five ships, which were second only to those of the Sidonians. In the council of war before the battle of Salamis, she strongly represented to Xerxes the folly of risking a naval engagement, and the event justified her opinion. In the battle she displayed so much courage, that it called forth from Xerxes the exclamation, 'that the men behaved like women, and the women like men.' To her Xerxes intrusted the care of his children, that they might be transported in safety to his kingdom. (Herodot. vii. 99. viii. 87-103.) She was represented in the Persian portico (*σπρά Περσική*), as it was called at Sparta) which was erected to commemorate the great defeat of the Persians. (Paus. iii. 11.)

ARTEMISIA, daughter of Hecatomnus, king of Caria in Asia Minor, and wife of Mausolus, whom she succeeded on his death B.C. 353. From all the accounts transmitted to us respecting her, she seems to have been strongly attached to her husband; but that she should have drunk the ashes of his body mixed with water, as Pliny tells us, is a statement rather extraordinary. (See also Valerius Max. lib. iv.) She proposed two prizes, one in tragedy, and another in oratory, to those who should pronounce the best panegyric on her husband; and among those who came forward, according to Aulus Gellius (x. 18), were Theopompus, Theodectes, and Naucrates: some have even added Isocrates. The successful competitors were Theopompus and Theodectes. She caused a monument to be erected to the memory of Mausolus, which, for its grandeur and magnificence, was considered one of the seven wonders of the world. It was called 'mausoleum' from the name of her husband, and hence the name mausoleum is often applied to funeral monuments. It seems to have existed in the time of Strabo (p. 656). She died after a reign of two years, and was succeeded by her brother, Idrieus, B.C. 351. (Diod. xvi. 45.)

ARTEMISIA, an extensive genus of plants belonging to the natural order *compositæ*, and remarkable for the intense bitterness of many of its species. It is easily recognised by the multitude of fine divisions into which its leaves are usually separated, and the numerous clusters of small, round,

drooping, greenish-yellow, or brownish flower-heads, with which its branches are loaded. The flowerets are all tubular, but those in the circumference of each head are very imperfect.

The most interesting species are wormwood, tarragon, and southernwood; the former (*Artemisia absinthium*) is met with frequently in waste places all over Europe and the northern parts of Asia. Its leaves have a silky or hoary aspect, in consequence of a thick covering of exceedingly delicate hairs, and they are deeply lobed. The flower heads are very numerous, and of a light buff colour. Wormwood is celebrated for its intensely bitter, tonic, and stimulating qualities, which have caused it to be an ingredient in various medicinal preparations, and even in the preparation of liqueurs. It derives its name from its use in destroying worms in children.

Tarragon (*Artemisia dracunculus*) is a Siberian species, the stems of which grow two or three feet high, are perfectly smooth, and of a bright green. Its leaves are undivided, very narrow, smooth, and rather succulent; when bruised they emit a stimulating odour, and if chewed produce a peculiarly pungent moisture in the mouth, which is so generally considered agreeable that the leaves are employed as a pickle, and as an ingredient in some kinds of vinegar. The flower-heads are small, round, and smooth, and contain seven or eight flowerets.

Southernwood (*Artemisia abrotanum*), an odoriferous herb found all over the south of Europe from Portugal to the Dardanelles, and thence through Palestine, Persia, and the middle of Asia into China, is frequently seen in old-fashioned gardens where it was cultivated for its peculiar aromatic scent. It is a hoary plant, becoming in warm countries a shrub, and even with us acquiring a woody stem after a few years; its branches bear loose panicles of nodding yellow flower-heads, which are externally grey with down; the leaves belonging to the panicles are much longer and narrower than those of the stem.

All these are increased either by division of the crown of the root or by what are technically called *slips*, that is to say, cuttings rudely torn from the woody part of the stem as near as possible to the ground; these strike root readily and make young plants in a month or two.

ARTERY, from the Greek *ἀρτηρία* (*arteria*), signifying an air-vessel; because the ancients, ignorant of the circulation, and finding the arteries always empty after death, supposed they were tubes containing air. Why after death the arteries are empty and the blood accumulated in the veins will be explained hereafter. By the term artery is meant a vessel which conveys blood from the heart to the different parts of the body: a vein, on the contrary, is a vessel which conveys blood from the different parts of the body to the heart. [See VEIN.] All the arteries of the system proceed from two great trunks immediately connected with the cavities of the heart, namely, the pulmonary artery, which arises from the right, and the aorta, which springs from the left ventricle. [See HEART.] The pulmonary artery conveys blood from the right ventricle of the heart to the lungs; the aorta carries blood from the left ventricle of the heart to all the parts of the system, and consequently is the common source of all the arteries of the body, with the exception of those which circulate through the lungs. [See AORTA.] The arteries derived from the aorta contain arterial, those derived from the pulmonary artery contain venous blood, and this latter vessel is the only artery in the system which does not contain arterial, that is, decarbonized or proper nutrient blood. [See BLOOD.]

The arterial system is arborescent, that is, the branches which spring from the aorta successively increase in number and diminish in size as they proceed from the heart towards their ultimate terminations in the system. Each trunk commonly ends by dividing into two or more branches, the combined area of which is always greater than that of the trunk from which they spring. The capacity of the branches is estimated to exceed that of the trunks in the proportion of one and a half to one. The arterial trunk always dividing into branches, and the larger branches into branches more and more minute, it is obvious that the blood in the arterial system is always flowing from larger into smaller tubes.

The organization of the arteries is peculiar, and differs considerably from that of the veins. [See VEIN.] They are of a yellowish-white colour, loose and flocculent on their external surface, but their internal surface is smooth and

polished. They are composed of three distinct membranes, which are superimposed one upon the other, and which are intimately united by delicate cellular tissue. Each of these membranes is called a tunic, or coat, and each possesses a peculiar structure, and performs a separate function in the circulation of the blood.

1. The internal tunic consists of a membrane, colourless, transparent, and thin, yet so firm and strong that it is supposed to resist more than any of the others the bursting of the artery by the current of the blood; for if, in a living animal, the other coats be entirely removed, this alone is found capable of sustaining the impetus of the circulation, and of preventing rupture from the dilatation of the artery.

2. The middle tunic, called also the fibrous and the muscular, is composed of yellowish fibres, which pass in an oblique direction around the calibre of the vessel, forming segments of circles which are so joined as to produce complete rings. In the larger trunks, several layers of these fibres can be raised in succession by the forceps, so that this coat is of considerable thickness, and it is proportionally thicker in the small branches than in the large trunks. This coat is firm, solid, and highly elastic. It is the main tunic by which the artery resists dilatation in the transverse direction, which it does so effectually, that when the left ventricle of the heart propels a fresh current of blood into the aorta, little or no dilatation of the vessel is perceptible. The characteristic property of the fibrous coat is contractility. If it be mechanically irritated, or if a chemical stimulant, such as ardent spirit or ammonia, be applied to it, the vessel contracts forcibly upon its contents. This contractile power, which properly belongs to the muscular fibre, induced anatomists to believe that the fibrous tunic consists of muscular fibres; but careful examination has shown that its organization possesses nothing in common with that of the muscular tissue, while chemical analysis has demonstrated that it contains no fibrin, which is the basis of muscle.

3. The external tunic, called also the cellular, consists of small whitish fibres, very dense and tough, interlaced together in every direction. It is much thicker in the large trunks than in the small branches, the reverse of the fibrous coat. Its outer surface is covered by a loose and flocculent cellular substance, which connects the artery with the surrounding parts, and particularly with the sheath of the vessel. Its firmness and resistance are so great, that it is not divided, however firmly a ligature may be placed around the artery; and its elasticity, especially in the longitudinal direction, is so remarkable that it has been called, by way of eminence, the elastic coat.

Arteries are themselves abundantly supplied with arteries, constituting their nutrient vessels, and called *vasa vasorum*; but these nutrient vessels of the artery form but few anastomoses, that is, but few communications with any other arteries. It is essential, in tying an arterial trunk, to disturb it as little as possible, and only to expose just so much of it as is indispensable for the proper application of the ligature. In the first cases treated by Mr. Hunter for aneurism [see ANEURISM], four ligatures were placed around the diseased artery, which was divided in the intervening space. Two of these were called safety-ligatures, being intended to be drawn tight if the others gave way; but the application of these ligatures disturbed the nutrient arteries of the vessel to such a degree, that inflammation, ulceration, mortification, and hæmorrhage ensued, so that those so called safety were really danger-ligatures, producing the very evils which they were intended to avert. The careful observation of the functions of these vessels has corrected this and several other errors, and led to most important improvements in surgical practice.

The principal nerves of arteries are derived from the ganglionic or the organic system, but with these are mingled branches derived from the sentient or the animal system. [See NERVE.] Accordingly, under ordinary circumstances, arteries carry on their functions independently of any influence derived from the brain and spinal cord, but they are capable of being affected by agents applied to those organs. Under ordinary circumstances, and in a state of health, arteries are but little sensible: they may be irritated in living animals by the scalpel, or by the application of chemical stimulants, without affording any indication of pain. Nevertheless, in certain states of disease, there cannot be a question that they become exquisitely sensible.

Among the physical properties of arteries, the most important are their extensibility and their elasticity. Their

extensibility is chiefly in the direction of their length. If an artery be tied in two places, and divided between the ligatures, the portion which is next the heart is sensibly elongated at each contraction of the ventricle; but their extensibility in the circular or transverse direction is not great.

After an artery has been extended, either lengthwise or transversely, it suddenly retracts on itself when the extending force is removed. If the finger be forcibly introduced into the section of a large artery, the sides of the vessel re-act on the finger, and proportionally compress it. If an artery be divided in the dead body, though emptied of its contents, it maintains its cylindrical form, and preserves its capacity unimpaired. The elastic property on which these phenomena depend is common to all the coats, but it is greatest in the external, and least in the internal tunic, and it is also much greater in the large trunks than in the small branches. Elasticity, in the longitudinal direction, restores the artery to its original state after it has been elongated in the various motions of the body; in the transverse direction, it keeps the artery open, and thus maintains a free channel for the passage of the blood through the vessel, while it also assists the fibrous tunic in resisting the over-dilatation of the artery by the impulse of the circulating current.

The most important vital property of the artery is its contractility, that is, its power of diminishing its capacity, or approximating its parietes, and thus proportionally acting upon its contents. Even the large trunks possess this property in some degree; but it resides chiefly in the ultimate divisions of the arterial branches, that is, the capillary vessels. The main purpose of the trunks and large branches of the arteries is to receive the blood from the heart, and to transmit it to the capillary vessels in the organs. The purpose of the capillary vessels is as various as the actions of the organs in which they terminate, and of which actions, indeed, they are the great instruments. Between the trunks and large branches of the arteries, and their ultimate divisions, there is such a total difference in structure and function, that they must be regarded as two distinct sets of vessels, and the latter require a separate consideration. [See CAPILLARY VESSELS.]

Arteries, besides capillary vessels, terminate also in veins, in exhalant vessels, that is, colourless vessels, which are supposed to open by minute orifices on various membranous surfaces, perhaps in lymphatic vessels (which see), and in excretory ducts. [See GLAND.]

The principal diseases to which arteries are liable, are inflammation, ossification (deposition of bony matter), calcareous deposition (deposition of chalky matter), and aneurism.

ARTESIAN WELLS are perpendicular perforations or borings into the ground, through which water rises from various depths, according to circumstances, above the surface of the soil, producing a constant flow or stream; they are highly useful in districts where springs or rivers are scarce, or where the usual surface water is of indifferent quality. These perforations have been named Artesian wells (*Puits Artésiens*) from the opinion that they were first used in the district of Artois in France. They are seldom more than a few inches in diameter, and are made by means of the usual boring instruments. Their action is due to the constant endeavour of water to seek its level, as will be readily understood by means of the accompanying diagram, representing a geological section of a country in which Artesian wells may be established.

Let *h, h, w, l, h, h* be the surface of a country upon which stands the town *T*: *a, a*, a bed or thick mass of rock, either impervious to water, or through which it percolates with difficulty: *b, b*, a sandy rock, or one through which water easily percolates among the strata that occur beneath the rock *a, a*, and are concealed by the latter in the plain *c, c* which the town, *T*, stands, but crop out, as it is geologically termed, or rise to the surface from beneath the rock *a, a*, at the heights, *h, h*, on each side: *c, c, c*, a rock through which water either cannot pass, or percolates with difficulty. It will be obvious that the rain-water, falling on the heights, *h, h*, and which may not run off into the

drainage depressions, will be absorbed by the exposed part of the rock, *b, b*. From the action of gravity the water would pass downwards upon the rock, *c, c, c*, which being impervious, or nearly so, to the passage of water, it will be checked, and take a direction under the other impervious, or nearly impervious, rock, *a, a*, percolating through all parts of *b, b*. From its endeavour to seek its own level, the water will strive to force its way through the superincumbent rock; but being unable to do so, it will, in the natural order of things, remain beneath, free from evaporation. If, under these conditions, a perforation be made at *w*, near the town *T*, through the rock *a*, into the rock *b, b*, the water in the latter will rise over the surface of *a, a*, at *w*, in proportion to the height of *l, h*, above the level of *w*, and to the checks, from various causes, which it receives while percolating through the rock *b, b*. It might be supposed that these checks would be sufficient to prevent any other than a very slow rise of water in the Artesian well, but it should be recollected that the quantity of water locked up beneath a mass of impervious rock of large area, such, for instance, as the London clay, is considerable, and that the hole or perforation is very small.

The rock *b b* may, in fact, be considered as the inside of a great pipe, into the two ends of which water is poured; so that when a hole is pierced in the upper side of the pipe, as at *w*, the water will spring up, and endeavour to attain the level of the water at the ends.

Artesian wells can be formed under circumstances which appear to the general observer somewhat different, though, in point of fact, they are much the same. Let *a, b, c, d, e, f*,

in the annexed diagram, represent a section of a country, several miles in length, and *h, i, k, l*, four different kinds of stratified rocks, resting conformably upon each other, among which the rock *k* is of a structure to permit the comparative free passage of water, entering it at *f*, while through the other rocks water either percolates with difficulty, or is unable to pass. In this case, the rock *k* merely performs the office of a longer pipe, not indeed so obviously to those unacquainted with geology on the large scale, as in a plain between heights; yet the principle of action is the same, for when the series of rocks, *h, i, k, l*, again rises to the surface on the side now truncated by the section, the same general facts are represented as in the first diagram, though on a much larger scale. Thus when a perforation is made at *w*, in the valley between the hills *a* and *b*, the water rises to the surface, and an Artesian well is established. The Artesian wells at Rouen exist under similar conditions.

In nature, great areas or sheets of stratified rocks, particularly those of a certain relative antiquity, are seldom unbroken; but are, on the contrary, fractured in various directions in consequence of disturbing forces which have acted upon them. Even in these cases, perforations for Artesian wells have sometimes been successful, the hole being pierced between the fracture or fissure and the point where the porous bed receives the rain-water.

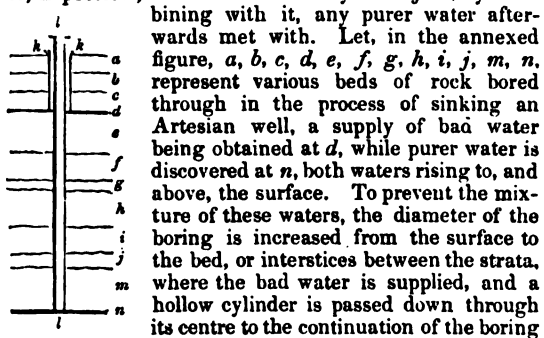

Let the line *a, b, c*, in the above wood-cut, represent the surface of a country; *d, d*, a porous bed, or one through which water, received at *c*, easily percolates, but can neither pass up nor down from the nature of the rocks above or beneath. Let *f* be a fracture or dislocation, geologically termed a fault, from the effect of which the bed *d* is suddenly thrown down to a lower level, on the left of our figure, and the continuity of *d* on the one side and *d* on the other is destroyed. If we tap, as it were, the bed or rock *d*, at *w*, the water in it would rise but a short height upwards, if *d* could be regarded as a hollow pipe, which, receiving its water at *c*, lets it pass freely out at *f*. The rapid percolation of the water is, however, checked by its friction among the particles of sand or against the sides of the strata, so that

when a perforation is made at *w*, and a free vent given to the water, it rises, and an Artesian well is established.

It will be evident that, if we regard the above section without reference to the artificial boring at *w*, we have a natural Artesian well, the fissure or fault *f* serving the same office as the artificial perforation; with this difference, that the latter may be considered as a mere puncture, while the effects of the former are felt along a more extended line, occasionally a few miles in length. Without such fissures, which permit the escape of water from beneath, many districts would be comparatively destitute of this great necessary of life, more particularly during droughts. Springs from fissures or faults are more permanent than others. This arises from the mechanical arrangement of the reservoir, if we may so term it, by which a vast quantity of water is accumulated, and can only escape by slow degrees; and thus severe droughts, which dry up the more superficial springs, are comparatively little felt in those from fissures.

It must be apparent from these considerations that extreme caution is necessary in the choice of situations for sinking to obtain Artesian wells, and that a general geological knowledge of the country, in which the attempt is to be made, should precede any borings for this purpose, otherwise much useless expense may be incurred, without a chance of success. Indeed, the power of pointing out those situations where Artesian wells may, in all probability, be successfully established, is one of the practical applications of geology to the useful purposes of life.

Water percolating through, or among the strata of rocks, becomes impregnated with various substances, some of which are injurious to animal or vegetable life, and to various useful processes in the arts. Now it sometimes happens, in sinking Artesian wells, that one or more of the lines of water, which may be tapped, are of this description; it therefore becomes advisable to get rid of such water, if possible, in order that it may not injure, by combining with it, any purer water afterwards met with.

beneath the line of bad water at *d*, in such a manner that the latter cannot mix with the column of good water, *l, l*, rising from *n*, but passes up round the interior cylinder, and delivers itself on the surface at *k, k*. It by no means follows, because the first supply of water met with in a boring will not rise to the surface, that all other lines of water in the same boring will also refuse to rise, for it frequently happens that small supplies are first cut through which do not elevate themselves above a few feet in the pipe or perforation. These smaller springs are due to the more local percolation of water, and though they obey the same laws, rising to their respective levels, they do not reach the surface, because they are not connected with a system of supply which will enable them to do so. Numerous common wells are so far Artesian, that when a particular bed is cut (and there is generally one or more known to well-sinkers in every district), the water will sometimes rise in them so suddenly as to render an immediate escape by the workmen necessary. In such cases the water in these particular lines does but seek its level; its rapidity in effecting this is proportioned to the freedom with which it can percolate or flow through the beds or fissures of strata containing it.

Artesian wells are necessarily of various depths, and it has been observed by M. Arago and others that the temperature of the water in them increases with their depth, due regard being paid to the mean temperature of the climate in which they may be established. This fact has been considered an argument in favour of the interior heat of the earth.

Artesian wells are now established in various parts of the old and new world; many have been made in the United States; and, notwithstanding their name, appear to have been known as well in Italy as in Artois from time im-

moial. It is also probable that they were known to the antients, for, according to M. Passy (*Description Géol. de la Seine Inférieure*), Niebuhr cites the following passage from Olympiodorus:—'Wells are sunk in the oases from 200 and 300 to 400 yards in depth (the yard being equal to half a foot), whence water rises and flows over.'

ARTEVELD, JACOB, a brewer of Ghent, and a great popular leader in the early part of the fourteenth century.

Louis, then count of Flanders, had married a niece of Charles le Bel, king of France. He was grandson of Robert de Bethune, on whose death a dispute arose between Louis and Robert de Cassel, his uncle, about the succession, which was decided by the parliament of Paris, supported by the king of France's power, in favour of Louis. This measure did not gain for Louis the affection of his subjects, and his violent conduct tended to alienate them still more. The great towns of Flanders had charters and privileges, and could not be taxed without their consent. Their wealth consisted in their manufactures and commerce, by which they had been long connected with England, from which country they drew the wool required for their cloth fabrics. The chief proprietors in the country were nobles, who generally took the part of the count and of his French patron, for the king of France was then suzerain of Flanders. The four principal chartered communes, or municipalities, of the county of Flanders were Ghent, Ypres, Bruges, and the country or district of Bruges, which was called *le Franc*, or 'free country.' Bruges during this period repeatedly revolted against Count Louis, and at last took him prisoner, and kept him till the people of Ghent, who were then jealous of their neighbours of Bruges, rescued the count. Another and a more general insurrection of the Flemish was put down by Philip de Valois, who had succeeded Charles le Bel; he defeated the Flemish in a great battle at Mount Cassel in 1328, and obliged them to surrender at discretion. The leaders were put to death, and the towns were heavily taxed.

The war which broke out some years after between Philip de Valois and Edward III. of England gave occasion to another revolt of the Flemish towns. This time Ghent took the lead, and the burghers elected for their captain Jacob Arteveld, a brewer, who superseded the authority of the count, and was in fact the ruler of Ghent. Jacob had the great qualities, as well as the vices, frequently found united in the character of a demagogue. He was active, eloquent, and bold, but violent, overbearing, and tyrannical. He flattered the people, proscribed the nobles, and divided their spoils amongst those of his own party. Edward of England having sent messengers to Flanders, for the purpose of bringing the Flemings to act with him against Philip of France, Arteveld declared for him, and induced the people of Ghent to form an alliance with the English. In order to remove the scruples of the Flemings on account of their allegiance to the French crown, he advised Edward to assume the title of King of France. Count Louis, who was attached to King Philip, opposed Arteveld's intrigues, and in a diet held in the town of Bruges, he caused one of the promoters of the English alliance to be seized and beheaded at Ruppelmonde. The people of Ghent, infuriated at this proceeding, marched to Bruges, and compelled its burghers to join the English alliance; and the insurgents, strengthened by the assistance of the English, defeated the count and his nobles, who were obliged to evacuate Bruges. The count withdrew to France, but returned again in 1338, and made an attempt to conciliate his refractory subjects. Having entered Ghent, he tried to persuade the popular leaders to side with him and with Philip of France, but the burghers shut the gates, made the count prisoner, and compelled him to sign a treaty of alliance offensive and defensive with King Edward (Dec. 1339). Louis soon after found means to escape from Ghent, and again withdrew to Paris. The war now raged between the French on one side and the Flemings and the English on the other. The latter besieged Tournay, but were defeated by the French near St. Omer in 1341. A truce being agreed upon between the hostile parties, King Edward went to Ghent to meet Count Louis, whom he tried to win over to his side, but without success. After Edward's departure from Ghent on his return to England, Count Louis, seeing his subjects wholly estranged from him, and his authority openly set at nought by Arteveld, once more withdrew to Paris. Arteveld now proposed that Edward's son, the young Prince of Wales, afterwards called the Black Prince, should be elected governor of Flanders, on the under-

standing that the country was to be made by Edward a sovereign duchy. But the Flemings, although they wished to humble their count, were not prepared to disinherit him and his line altogether; and they began to mistrust Arteveld's intentions. A dispute broke out at Ghent between the various trades, in which the fullers were arrayed against the weavers, and a battle was fought in the great market-place between the two factions, which lasted all day; 1500 fullers were killed, and the weavers, being victorious, drove the rest of the fullers out of the city, and utterly destroyed that trade. Arteveld had not taken an open part in the contest, but being jealous of the rising authority of Gerrard Denys, the dean of the weavers, he secretly introduced into Ghent 500 English soldiers, whom he lodged in his premises. Denys and the weavers cried out treason, attacked Arteveld, and killed him, with many of his English soldiers, in July, 1344. The Flemish, however, continued in their hostility to Count Louis, who fell at the battle of Crecy in 1346, fighting in the French ranks. He was succeeded by his son Louis II., called *de Male*, from the castle of Male, his favourite residence. Arteveld's authority in Flanders lasted seven years, during which, in spite of many acts of violence and injustice, the cities prospered in their trade, and enjoyed great respect among their neighbours. (Oudegherst, *Chroniques et Annales de Flandre*.)

ARTEVELD, PHILIP VAN, was the son of Jacob Arteveld. Philippa, Edward III.'s queen, held him at the baptismal font, and from her he received his Christian name. His father left him wealth, and his mother, a woman of a prudent character, watched over his youth. She negotiated an early marriage for him with a lady of good family, after which Philip lived quiet and happy with his wife and mother, keeping aloof from all public affairs. But he had a name which was connected with party feelings and recollections. A fresh revolt broke out at Ghent in 1379 against Count Louis de Male, and after several engagements and many atrocities perpetrated on both sides, the count succeeded in intercepting all supplies to the insurgent city, which was reduced to great distress. Van der Bosch and the other leaders of the Ghentese, finding that the people were impatient of their assumed authority, thought of strengthening themselves by engaging Arteveld as the nominal chief of their party. They proposed him to the people, and he was elected Captain by acclamation. After some desultory negotiations with the count, in the course of which two deputies of Ghent who had agreed to surrender the town were stabbed in the market-place by Van der Bosch, Arteveld, seeing that it was impossible to hold out any longer for want of provisions, conceived the bold resolution of marching out with a chosen body of men and attacking the count, who was then at Bruges. He left Ghent on the 2d of May, 1382, with 5000 men, determined to conquer or die, and halted in a good position, within three miles of Bruges. The next day was a great festival in that city. In the midst of the processions and rejoicings, news came of the Ghentese being at hand. The count went out to encounter them with a body of 800 knights and squires, followed by a numerous but disorderly multitude of the people of Bruges, especially of the butchers, glaziers, cordwainers, and boatmen, who thought they were marching to certain victory over a few half-starved Ghentese. The Ghentese had a marsh in front of their position, and their flanks were protected by a line of carts: they commenced with a brisk fire of artillery upon the assailants, which checked their ardour. Arteveld, by a skilful movement having succeeded in drawing the enemy into the marsh, the men of Bruges fell into confusion, many of the knights were killed, and the rest carried along by the flying multitude. The count re-entered Bruges with only forty horsemen, and the Ghentese poured in at the same time. It was now night, and before the citizens of Bruges had time to recover from their panic, the city was given up to plunder. All the count's people, as well as the butchers and other trades favourable to him, were hunted out and killed. The rabble of the town, as well as many of the servants and apprentices, joined the Ghentese in this horrible carnage. Arteveld succeeded in stopping the indiscriminate slaughter in the morning; but the magistrates and nobles were deliberately sought after and led to execution as traitors to their country. The commerce of Bruges was annihilated for a time by this catastrophe. The count remained concealed that night and the following day in the

house of a poor woman, who had often received charity at his palace gate.

After the capture of Bruges, the other towns of Flanders, with the exception of Oudenarde, opened their gates to Arteveld. He now assumed the state and pomp of a sovereign prince, taxed at will the country people, but took care to keep the city of Ghent well supplied with provisions at a low price. His camp abounded not only with all necessities, but also luxuries. He began the siege of Oudenarde, in which, however, he was unsuccessful. Meantime the people of the neighbouring states, Hainault, Brabant, Liege, &c., showed a disposition to make common cause with the Flemings, and the spirit of revolt spread also into France, where the people were dissatisfied with the exactions and oppressions of their nobles. The feudal nobility at that time had lost much of its old chivalrous spirit, as well as of its independent power, which had been curtailed by the crown, but it still retained all its vexatious and tyrannical demeanour towards the burghers and peasants. It was still, in fact, above the laws. The duke of Burgundy, regent of France, easily induced the young king, Charles VI., to assist Count Louis in putting down the Flemish insurgents, before the English had time to join them. A large force was collected under the command of Olivier de Clisson, a skilful but merciless commander: the oriflamme was displayed, and the campaign began in November, 1382. The French advanced to Roosebeke, between Courtray and Ghent. Arteveld rashly advanced to attack them. His men, equal in numbers, but inferior in military skill, were arrayed too closely, so that the greater part of them had not room to wield their weapons. The battle lasted only half an hour, and 25,000 Flemings were killed, most of them in the pursuit. The body of Arteveld, being found under a heap of slain, was suspended on a gibbet. The battle of Roosebeke has been compared, for the importance of its results, to those of Ætius against Attila, and of Charles Martel against the Moors. 'Had the Flemings been successful,' observes Froissart, 'the insurrection which had already begun at Paris, would have spread all over France, and would have proved more horrible than the Jacqueries; the whole of the nobility and gentry would have been destroyed.' The troubles of Flanders continued for some years longer, until, after the death of Count Louis in 1384, Philip the Bold, duke of Burgundy, who had married Margaret, the count's only daughter, succeeded him in the possession of Flanders, and at last restored it to peace. (*Barante, Histoire des Ducs de Bourgogne de la Maison de Valois.*)

ARTHUR'S. [See Gouv.]

ARTHUR. We shall divide this article into two heads: the first, comprising those particulars of the life of this celebrated British chief which appear to rest on historical evidence; the second, giving a short account of that mass of fictions concerning him which forms the earliest portion of our national literature. Truth, indeed, has been so overlaid by fiction, that some writers (Milton among them) have denied that such a person as Arthur ever existed. Of this there seems no more reason to doubt, than of the existence of Hengist, Cerdic, or any other man of note of that time. Beside the later works of Nennius and Geoffrey, the most ancient specimens of Welch poetry, the Triads, the poems of Llywarch Hen, and of Taliessin, speak of him, not as the fabulous prodigy described by later romancers, but as a prince and captain of eminence, yet not distinguished by a marked superiority over others his contemporaries. The following are the incidents of his life which appear to be best attested.

He was a prince of the tribe of Britons called Silures: according to some accounts, the son of Meiric ap Tewdrig (Owen, *Camb. Biog.*); according to the common story of Uther, named Pendragon (Dragon's Head): a title given to an elective sovereign, paramount (at least nominally) over the many kings of Britain. The date of Arthur's birth, or even of his accession to his paternal inheritance, it is vain to inquire. He appears to have commenced his martial career about the year 500, and was raised to the Pendragonship, according to Owen, in 517; according to Whitaker, in 508. Nennius asserts that he gained twelve victories over the Saxons. Of these, eleven have been determined by Mr. Whitaker (*Hist. of Manchester*, vol. ii. chap. 2), with great acuteness and plausibility, to have been fought in Lancashire, or still farther to the north, at a period anterior to his election to the Pendragonship. For the ground of that writer's belief we must refer to his work: the

reader will at least be repaid by seeing how connected, circumstantial, and plausible a story, may be made out of a meagre string of corrupt or unknown names, assisted by scattered notices in ancient chronicles, and local knowledge, and popular tradition. All this early history of Arthur is placed in the north, whither he is said to have been sent by Ambrosius, his predecessor in the Pendragonship; but after he became Pendragon, all his exertions were devoted to stopping the progress of the Saxons in the south, led by the active and successful Cerdic. He was commander-in-chief at the battle of Llongborth (literally the 'haven of ships,' supposed by Mr. Turner to be Portsmouth), on the authority of Llywarch Hen, a well-known Welch bard, who fought in that battle, and composed an elegy, still extant, on the death of his friend Geraint ap Erbin, who fell in it. He mentions elsewhere another battle, in which 'Arthur did not recede,' fought on the river Llawen. The next and the most important battle is that of Badon (placed by Whitaker at Badby in Wiltshire; by Camden and Turner at Bath; by Carte, in Berkshire), the twelfth battle in the list of Nennius, mentioned also by Gildas, Bede, and others, which checked the progress of Cerdic, and compelled him to content himself with those provinces along the south coast which he had already gained; from which Arthur is not recorded to have tried to expel him. The date of this is variously placed. Whitaker, following Matt. West., says 520, which a doubtful passage in Gildas seems to confirm. From this time we hear no more of Arthur, until the revolt of his nephew, Modred, or Medrod, which led to the fatal battle of Camlan in Cornwall, in 542. Modred was slain, and Arthur, mortally wounded, was conveyed by sea to Glastonbury, where he died and was buried. Tradition preserved the memory of the place of his interment within the abbey, as we are told by Giraldus Cambrensis, who was present when the grave was opened by command of Henry II., and saw the bones and sword of the monarch, and a leaden cross let into his tombstone, with the inscription in rude Roman letters, *Hic jacet sepultus inclitus Rex Arturius, in insula Avalonia*, as seen by Leland, and copied from an attested copy by Camden. This story has been elegantly versified by Mr. Warton. A popular traditional belief was long entertained among the Britons that he was not dead, but had been carried off to be healed of his wounds in Fairy-land, and that he would reappear to avenge his countrymen, and reinstate them in the sovereignty of Britain.

The Arthur of romance is a very different person. He is the son of Uther Pendragon by Igera, wife of Gorlois, Duke of Cornwall, and owed his birth to a magical device, by which Uther assumed the form of the lady's husband. He succeeded to his father when fifteen years old, and immediately prosecuted hostilities against the Saxons in the north of England. He defeated them on the banks of the river Douglas, which, according to Geoffrey, was near York, but Whitaker has placed it in Lancashire. (See his very ingenious sketch of this first campaign, vol. ii. chap. 2. sect. 1, 2.) He again defeated them under the walls of Lincoln, and compelled them to quit England and abandon their booty, as the price of their safety. Breaking this agreement, they sailed round the island, and landed at Totness in Devonshire. Arthur hastened by forced marches to punish this new aggression, and routed them with immense slaughter at the great battle of Mount Badon, in which he slew 470 men with his good sword Caliburn and his lance Rou. Again he hastened with all speed to Scotland, to relieve Dunbarton (Alclud), besieged by the Scots and Picts. Having done this, and pursued those barbarians into the fastnesses of Loch Lomond, where he fitted out a fleet and obliged them to surrender, he returned southwards, kept his Christmas at York, and employed himself in destroying the Pagan temples of the Saxons, and restoring the Christian churches. The following summer he conquered Ireland and Iceland, and then returned to Britain, where he spent twelve years in peace. We need not dwell on his foreign conquests of Norway and Gaul, which occupied ten years more. He then returned to England, and held a great festival at Caerleon in Monmouthshire, where he was solemnly crowned, a multitude of tributary kings attending him. Not long after the Romans demanded tribute; on which he collected a mighty army, and passed into Gaul. There he defeated the Romans, and was preparing to cross the Alps, when he received intelligence of the revolt of Modred, who had allied himself with the Saxons, Scots, and Picts. Arthur gained two victories, one on the coast of Kent and one

near Winchester, and forced Modred to fly into Cornwall, where a third engagement, fatal to both, was fought on the river Camlan.

Such is the story told by Geoffry of Monmouth, and much later by Buchanan (*Historia Scotica*), and adopted with all manner of additional fiction by the romancers. The reader will see how widely it differs from the particulars above related on earlier British authorities. Yet Geoffry professed to draw his account from an Armorican or Breton original. Whether he indulged in these amplifications himself, or whether tradition had already so transformed the British hero, has been disputed: we think it clear, however, that Geoffry is not entitled either to the credit or discredit of having invented the preposterous story which he has told. (See Ellis's *Specimens of Metrical Romances*, v. i. p. 85, &c.) It is remarkable, however, that in these Armorican tales, if such they are, we find more mention of the Pihts, Scots, and Irish, than of the Saxons; more traces of Arthur's presence in the north than in the south of the island, though the southern districts may be supposed to have been most familiar to the Breton bards. So in the romances founded on those tales, *Merlin*, *Morte Arthur*, *Lancelot*, and others, the scene is more frequently laid in the north than the south; and York and Carlisle occur more frequently than Caerleon or Caer-gwent (Winchester). Cornwall, however, is a favourite country in romance, and this may point to an Armorican original. On the other hand, our British authorities, Taliessin, Gildas, Aneurin (Gildas and Aneurin, however, have been thought to be the same person), and Llywarch Hen, were all connected with the north of England; yet they are silent as to Arthur's exploits there, and only mention his resistance to the Saxons in the south. This inversion of what might have been expected has not, as far as we are aware, been noticed by any writer on this subject. There is an ancient collection of Welch stories for children, called *Mabinogion*, which invests Arthur with certain mythological attributes of romance, which have led Mr. Owen, above quoted, into some very mystical speculations. The island abounds with memorials of the fame of Arthur, whether he be a real or imaginary person: we have Arthur's Seat; Arthur's Round Table, in more than one place; Arthur's Castle; the Welch call the constellation Lyra Arthur's Harp (*Telyn Arthur*); and the Principality abounds in monuments of art or nature which bear his name. The industry of the topographer would soon multiply references.

For the genuine history of Arthur, see the *History of the Anglo-Saxons*, by Sharon Turner, and Whitaker's *History of Manchester*. The work of Geoffry, and the early romances which relate to Arthur, will be found fully treated of in Warton's *History of English Poetry*, vol. i.; Ellis's *Specimens of Early English Metrical Romances*, and Dunlop's *History of Fiction*.

ARTHUR, DUKE OF BRETAGNE. [See JOHN.]

ARTHUR'S SEAT. [See EDINBURGH.]

ARTICHOKE. [See CYNARA.]

ARTICLE, the name given by modern grammarians to the two little adjectives *the* and *an* in the English language, and to words of like import in other modern languages, the former being called the definite, the latter the indefinite article. We do not attempt a more philosophical definition, because the separation of these words from the other adjectives of language, whether pronouns or not, appears to depend upon no very accurate principle; and the distribution of the parts of speech would perhaps not be the less philosophical, if the so called articles were restored to their proper place. The indefinite article *an* is only a corruption of the adjective *one*, or, as our ancestors wrote it, *ane*; and *a* is a still more violent corruption of the same word. Thus in German *ein* is at once equivalent to our *one* and to *an*. In the same way the French *un*, Italian *uno*, Spanish *uno*, &c., are evidently derived from the Latin *unus*. On the other hand, the definite article will appear, on the slightest consideration, to be a corrupted demonstrative pronoun. The term article or ἀρθρον (a joint) was invented by the Greek grammarians, but as used by them it is only applied to the definite article, and also to what, by modern grammarians, is called emphatically the relative (who). Nor is there any inconsistency in applying the same term to these two notions, which will be found on examination to have a common origin. The element *ro* (to) of the Greek language, corresponding in power to our word *this*, was employed perhaps originally to denote a physical object pointed out at the

time by some action of the body; secondly to an object mentioned just before, and thus mentally present both to speaker and hearer; or, lastly, to an object forthwith to be brought before the hearer's mind. In the last case we are likely to have a repetition of the defining particle, as: 'I gave you *the* book *which* you asked for,' or, what is equally good, except in rhythm, 'I gave you *that* book *that* you asked for.' It was from the contemplation of such a sentence as this that the Greeks considered the defining particles as performing the office of joints which connect the two propositions together; and to distinguish the one article from the other, that which precedes the noun (the) was called the *prepositive* article, and that which follows it, viz. the relative, the *postpositive* article. The qualifying terms are perhaps not very well chosen, but undoubtedly the term article is very expressive of these relative particles, which in all cases, or nearly so, do perform the duty of connecting two propositions together; and hence we ought not to be surprised that a large proportion of the conjunctions have their origin in the relatives or demonstratives. But the repetition of the defining, demonstrative, or relative particle is no way necessary. Whether we say 'I gave you *that* book' (pointing to it), or, 'You asked for a book *that* (or *that* book) I gave you,' or, lastly, 'I gave you *that* book you asked for,' the word *that* performs in all cases the same duty. The two ideas thus logically connected in the expression—'I gave you the book that or which you asked for,' are—'You asked for the book: I gave you the book.' It is only a luxury in language to vary the forms according to the mere place in a sentence that a word may occupy; and if, in the more polished forms of the Greek language, we find the demonstrative, the definite article, and the relative distinguished, yet they are all evidently derived from a common parent, *ro*, and its dialectic varieties. In Homer, the article does not yet appear; in Herodotus, the same element performs at times all the three offices. As we descend chronologically we find the tragedians still confounding the diverging forms of the relative and article, and even in certain phrases, retained by the later writers, traces of the same confusion arising from a common origin were yet to be seen. Matthiæ in his *Grammar* has so fully acknowledged this triple power of the Greek pronoun, that he treats of the article under the three heads—1. of the article; 2. of the article as a pronoun (he means a demonstrative pronoun); 3. of the article for the pronoun relative.

The Latin language had but an imperfect definite article in its pronouns *hic*, *ille*, *is*; but besides these we find the relative at times employed where the English idiom at least requires the demonstrative *this*; and what is called the conjunction *quod* (that), like the corresponding Greek *ὅτι*, or French *que*, has the form of a relative, and the meaning of a demonstrative. To trace the same analogy in the Teutonic languages, the German *der*, of which *de* only is radical, is at once demonstrative, relative, and definite article. So completely does the German agree with the Greek, that, when *der* threw off much of its demonstrative power to play the part of the mere article, a kind of doubled form, *dieſer*, was adopted for the pure demonstrative, on the same principle of formation as *οὗτος*, from *αὐτός*, with the same meaning in Greek. And lastly, the English philologist will find the same threefold power among the derivatives from the English allied root *the*, viz. among the forms *this*, *that*, *than* (compare the Latin *quam*), *there*, *thence*, *the*, &c. The form *that* is still retained, as was before observed, with the power of the relative; but in the older writers, *there*, *thence*, &c., were freely used where we now only employ *where*, *whence*, &c.

Horne Tooke, whose views of etymology were neither extensive nor accurate, has fancied that the English article *the* is the imperative of an Anglo-Saxon verb *dean*, to take. (*Diversions of Purley*, Taylor's edition, ii. 63.) We need not repeat that it is allied to the German *der*, or rather the Dutch *de*, for the *r* is merely the characteristic of a masculine nominative, to the Gothic *sa* or *tha*, and through these to the Greek element *tō*, a form which actually occurs in the English *to-day* (ho-die), and no etymology for the English article will be satisfactory which does not equally apply to all these languages. In the same way the definite articles of the modern languages derived from the Latin are all referable to the Latin demonstrative *ille*, *illa*, &c. [See RELATIVE, PRONOUN DEMONSTRATIVE.]

ARTICLES OF FAITH. [See CONFESSIONS.]

ARTICLES OF WAR. [See MUTINY ACT.]

ARTICULATA, or ARTICULATED ANIMALS, form the third great section of the animal kingdom, according to the arrangement of Cuvier. They are so called because the different portions of their body are composed of moveable pieces *articulated* to each other. They differ from molluscous animals in generally possessing a skeleton, and from vertebrated animals, by their skeleton being external, while that of the vertebrated is internal. Though presenting considerable diversity of character among themselves, they are generally provided with a skin, which is either soft (as in the leech), or horny and crustaceous (as in the crab and craw-fish). Certain families are destitute of feet, but the greater number are provided with these members, which, when present, are never fewer than six. The connexion of the joints of the members is so close as to permit only a very limited range of motion to each; which is, however, compensated by the greater number of pieces which constitute each member or limb.

The point in which there exists the greatest degree of accordance or resemblance among articulated animals, is the nervous system. Their brain is extremely small, and two nervous cords, surrounding the œsophagus, or gullet, and continued along the abdomen, unite here and there into knots, or ganglia: in some *crustacea* it is still more simple, consisting merely of two knots, one placed at the head, the other in the thorax, united by slender threads. The organs of sense are very imperfectly developed, and in some cases are altogether wanting, except the organ of sight. No organ of smell has yet been discovered, unless the *antennæ* of insects be considered such. The eye presents considerable diversity of structure, being sometimes one and single, or three united in a triangle; in other cases composed of a considerable number of little plates, or facettes (as in the fly), each of which receives a branch from the optic nerve.

The mouth is sometimes destitute of jaws, but when these are present, they are never one above the other, but always lateral; and frequently there exist several of these ranged in succession, the two anterior of which are termed mandibles.

The respiration is effected either by branchiæ, as in those which habitually live in water, such as the crustacea, or by tracheæ, *i. e.* by air-tubes formed of three parts, one membrane internal and one membrane external, both of which are cellular; and a sort of cartilaginous elastic tube, rolled spirally, and placed between the two membranes. These tracheæ receive air by certain lateral openings termed *stigmata*. More rarely, there exist cellular cavities analogous to lungs.

The organs of the circulation vary very much. Sometimes there is a distinct heart, whence proceed blood-vessels, which differ in number in the different orders. (See *Recherches sur la Circulation dans les Crustacés*, par MM. Audouin et Edwards, quarto, Paris, 1827; also, *Annales des Sciences Naturelles*, 1827.) In other instances there is no distinct heart, and the vessels which carry on the circulation are not yet well ascertained; this is more particularly the case in those articulated animals which respire by tracheæ, and in which these organs seem in a certain degree to perform the functions of blood-vessels.

The Articulata have been divided by Cuvier into four classes: viz., 1. Annelida. 2. Crustacea. 3. Arachnida. 4. Insecta. Of these, the general characters have been given under the subject ANATOMY (COMPARATIVE); and the orders, and necessary details, under the heads ANNELIDA, ARACHNIDA; to which we refer, as well as to CRUSTACEA and INSECTA.

ARTICULATION, the term by which anatomists express the union of the different bones of the skeleton. The junction of any two bones, however firmly or loosely connected, or in whatever mode the union may be effected, is designated by the name of articulation. Commonly two substances are employed as the media by which the connexion is established, namely, a firm and strong membranous tissue termed ligament [see **LIGAMENT**], which may be considered as the band by which the bones are tied together, and a peculiar substance termed cartilage or gristle [see **CARTILAGE**], which is often interposed between the surfaces of the bones to be united, and which, besides serving as the bond of union, accomplishes other purposes.

Of all the parts of the animal fabric, there is none in which mechanism is more clearly or beautifully shown than in

the connexions of the bones with each other; and more especially in the structure of joints. There is no part of the human body which deserves or which receives on the part of the intelligent surgeon more careful study. The manifold and serious injuries to which joints are exposed, such as the various modifications of dislocation and fracture, afford him an opportunity of exemplifying the inestimable value of his art, in the sure and speedy reparation of such injuries which it enables him to effect, and especially when viewed in contrast with the suffering and deformity which result from neglect or from want of skill.

The objects to be obtained in the economy by the union of the several bones of the body are various and even opposite, requiring almost every conceivable variety in the mode of their connexion. And such variety actually exists; but still these varieties admit of classification, and they may all be arranged under three heads, namely, those which form immoveable, moveable, and mixed articulations.

1. One object to be accomplished by the union of bones is, to form a secure situation for tender and delicate structures. Accordingly the bones are often so disposed as to enclose cavities in which the organs that need protection are placed; such, for example, is the cavity of the head which encloses the delicate substance of the brain; the cavity of the spinal column, which encloses the no less delicate substance called the spinal marrow; and the cavities of the chest and abdomen, which enclose soft and tender organs, on the security of which life depends. Bones forming cavities of this class are generally so firmly united that they admit either of no motion whatever, or only of a very slight degree of it, the union being effected sometimes by the apposition of the surfaces of strong and flat bones; at other times by the formation of numerous prominences and depressions which mutually receive each other: examples of both these modes of union are found in the articulation of the bones of the head and face. The firmness of the union is sometimes increased by alternate indentations and projections, like the teeth of a saw, formed on the surfaces of bones, the surface of the one bone being precisely adapted to that of the other; by this mechanism the bones become firmly impacted, and deficiency in extent of contact is compensated by what may be truly called (and it is an admirable example) dove-tailing. *Suture* is the term given to this mode of union, and the bones of the cranium are nicely adjusted and firmly united to each other in this manner. At other times a ridge is formed in one bone which is received into a groove fissured in another. The bony part of the septum which divides the nostrils affords a specimen of this mode of union, while the teeth are secured in their sockets, that is, a conical surface is firmly impacted in a cavity, very much as a nail is fixed in a board.

2. The moveable articulations are those in which the bones are in contact, but not continuous with each other; such, for example, is the union of the arm with the shoulder, the forearm with the arm, the wrist with the hand, the lower jaw with the head, the head with the trunk, and so on. In these cases the articulating surfaces are mutually adapted to each other, in general one being convex and the other concave, and the bones are maintained in their situation by the firm and strong membranes termed ligaments. Sometimes the union is assisted by the muscles which surround the joint, as is strikingly exemplified in the shoulder-joint, in which the head of the humerus is kept in contact with the cavity which receives it, partly, without doubt, by ligamentous substance, but partly also by the surrounding muscles. This is proved by the effect of disease; for if by paralysis, or any other cause, the neighbouring muscles become very much weakened, dislocation of the joint readily takes place. Both the strength of the joint and the range of its motion depend mainly on the extent of its articulating surface, and on the arrangement of the ligamentous substance by which the bones are held in their situations. The extent of contact, and the strength and adjustment of the uniting band, are different in every different joint, the diversity being regulated in every case by the kind and degree of motion which it is intended that the joint should exercise.

3. The mixed form of articulation resembles the *immoveable*, in having the bones connected by an intermediate substance (cartilage), and the *moveable* in admitting some degree of motion between the surfaces. The articulations between the several bones that form the spinal column afford examples of this mode of union. There are numerous modifications of these several kinds of articulation, which

are described with great minuteness in anatomical books, and most of which are distinguished by specific names

ARTICULATION. [See VOICE.]

ARTILLERY, a word believed to be of French origin. Menage derives it from the old word *artiller*, to fortify. Vossius (*De Vitiis Sermonis*, lib. iii. cap. 1) says the antient word, instead of Artilleria, was *Arcualia*, from *arcus*, a bow; the earliest military engines of this description having arisen out of improvements upon the bow and arrow. Artillery, in its most general signification, implies all kinds of missiles with the engines used in propelling them. Since the application of gunpowder to projectiles, it has chiefly been confined to large ordnance, or cannon, mortars, howitzers, &c., to which rockets are now to be added; and includes their ammunition and appurtenances.

It was long after the nations of the East had formed war into a science, that military engines, such as are comprised in the term artillery, were invented. The earliest were, in all probability, those for casting stones of prodigious weight. Of Uziah (B.C. 1000), in 2 Chron. ch. xxvi. v. 15, it is said, 'And he made in Jerusalem engines, invented by cunning men, to be upon the towers and upon the bulwarks, to shoot arrows and great stones withal. And his name spread far abroad; for he was marvellously helped till he was strong.'

The names Balista, or Ballista, and Catapulta imply a Greek origin. The balista was for throwing stones, the catapulta for propelling darts and arrows. The invention of the latter of these instruments, or rather its re-invention, is ascribed by Pliny (lib. vii. 56) to the Syrians; but Diodorus (lib. xiv.) and Plutarch (*Apophth.* edit. Wytenb. 4to. Oxf. i. 533) say they were contrived in Sicily, about the same time with the battering-ram, alluding to a period not more than 300 B.C. Ælian (*Var. Hist.* vi. 12) ascribes the invention to Dionysius the Elder himself in Sicily. The balista is attributed by Pliny to the Phœnicians. Both instruments were unquestionably much used in the Roman times: they are mentioned in Cæsar, Cicero, Livy, Seneca, Tacitus, and other writers; and were employed in great numbers by Titus at the siege of Jerusalem. Two thousand machines for throwing darts and stones were surrendered to the Consul L. M. Censorinus when he marched against Carthage. (Appian, lib. viii. *De Rebus Punicis*, § 80.) Ammianus and Vegetius are both particular in describing the construction of the balista. Vegetius, who lived in the fourth century, under Valentinian, speaks of balistæ, onagri, scorpiões, arcubalistæ, fustibuli, and fundæ, as engines of artillery (lib. iv. c. 22).

We have no evidence that machines of this description were known in England previous to the arrival of the Normans. According to the testimony of William of Poitou, machines of wood (exclusive of the cross-bow) were used for pouring forth showers of arrows even at the battle of Hastings; so early were they introduced in the Norman time. It is worthy of notice, that among the tenants *in capite* in the Domesday Survey, *balistarii* occur as well as *arcubalistarii*. Artillery, however, in the Norman period, was most frequently used in sea-fights, when not only stones and darts were discharged from the machines, but pots of Greek fire, quick-lime, and other combustible materials. Robert of Bruce (in Peter Langtoft's *Chronicle*), speaking of Richard I.'s wars against the Saracens, says, that in his barges and galleys he had mills, which were turned by the wind, and by force of the sails threw not only fire, but stones which were taken from the Rhine.

It would be tedious to enumerate all the arts and all the machines which were employed in the middle ages in assaulting and defending towns and castles. Indeed few sieges of great importance occurred without the invention of some new engine. Grose, in the preface to his *Antiquities of England and Wales*, has given the names and figures of a considerable number. Some of these were distinguished by the appellations balista, catapulta, espringal, trebuchet, mangona, mangonel, bricolla, petrary, matafunda, berfrey, and war-wolf. Père Daniel, also, mentions a machine called engine-a-virge, used by the English in France, as late as the reign of Charles VII. Of the vast force of these machines surprising stories are related in our chronicles. The engines used by Edward I. at the siege of Stirling Castle in 1303, according to Hemingford, threw stones of 300 pounds weight.

This antient artillery continued to be used in sieges for a considerable time, in some instances for two centuries,

after the invention of gunpowder and cannon. (See Père Daniel, *Histoire de la Milice Française*, tom. i. p. 319.) Greek fire continued also to be employed in war long after the introduction of fire-arms; particularly in the attack and defence of strong places; as at Ypres and Burburgh in France, in 1383. (Walsingh. edit. Camd. pp. 302, 303.)

The invention of gunpowder, however, by slow degrees brought about a total alteration in the art of war. Barbour, in his *Metrical Life of Robert Bruce*, tells us that cannon (which he calls 'crakys of war') were used by Edward III. in his first campaign against the Scots, A.D. 1327. Du Cange, in the article *Bombarda*, shows that the French used cannon at the siege of Puy Guillaume in 1338; and that Edward III. used them at the battle of Crecy, as well as at the siege of Calais in 1346, seems agreed. Four pieces planted on a little hill at the battle of Crecy did great execution among the French troops, and having been before unheard of in France, contributed as much by the surprise as the slaughter to the success of the day. (See Rapin, vol. i. p. 425.) By degrees, the use of cannon became more and more common. Petrarch, in his *Dialogues on the Remedies of Good and Bad Fortune*, written in 1358, describes cannon as no longer rare, or as viewed with astonishment and admiration.

Cannon, or, as they were then called, bombards, were the most antient fire-arms. The first cannon were clumsy and ill-contrived, wider at the mouth than at the chamber, and so like a mortar, that Dr. Henry supposed the idea of them might have been suggested by that in which Schwartz, a chemist of the beginning of the fourteenth century, who is said by the Germans to have discovered gunpowder, pounded his materials. They were all made of iron, without any mixture of other metals; and consisted usually of bars or pieces of iron fitted together lengthways, and hooped with iron rings. Some of them were too long, and others of them too short. In a word, the art of making cannon was still imperfect.

Both gunpowder and cannon were made in England in the fourteenth century. This appears from a commission given to Sir Thomas Norwich by Richard II., A.D. 1378, to buy two great and two small cannon in London, or in any other place, and also to buy certain quantities of saltpetre, sulphur, and charcoal, for making gunpowder. (Rym. *Fœd.* tom. vii. p. 187.) From the same commission, as well as from other evidence, it appears that cannon-balls were at first made of stone: for the same person is therein commanded to purchase six hundred balls of stone, for cannon, and for other engines.

Beside great guns, which are still named cannon, a smaller kind of ordnance called *hand-cannon* came into use at this period. They were so small and light that one of them was carried by two men, and fired from a rest fixed in the ground. (Père Daniel, tom. i. lib. 6, p. 321.) The 400 cannon, or the greatest part of them, with which an English army besieged St. Malo, A.D. 1378, mentioned by Froissart (Lord Berner's *Transl.* chap. cccxxii.), must have been of this kind: though Dr. Henry conjectures that these hand-cannon were first brought into Britain by the Flemings who accompanied Edward IV. in his return to England, A.D. 1471. The Scots, he adds, had a kind of artillery at this period peculiar to themselves, called *carts of war*. They are thus described in an act of parliament, A.D. 1456. 'It is thocht speidfull, that the king mak request to certain of the great barrons of the land that are of any myght, to mak carts of weir, and in ilk cart twa gunnis, and ilk ane to have twa chalmers, with the remanent of the graith that effeirs thereto, and an cunnand man to shute thame.' By another act, A.D. 1471, the prelates and barons are commanded to provide such carts of war against their old enemies the English. (Henry, *Hist. Brit.* from Black Acts, James II. act 52, James III. act 55.)

The instruments of artillery of the middle of the fifteenth century, though all called by the general name of cannon, were of very different kinds, shapes, and sizes; and distinguished from each other by particular names. The letters which Edward IV. addressed to different persons in 1481 for the resistance to invasion from Scotland speak of 'bumbardios, canones, culverynes, fowlers, serpentynes, et alios canones quoscumque, ac pulveres sulphureos, saltpetre, petras, ferrum, plumbum, et omnimodas alias stufuras pro eisdem canonibus necessarias et oportunas.' (Rym. *Fœd.* tom. xii. p. 140.)

A French translation of *Quintus Curtius* by Vasqua de Lucene, a Portuguese, written in 1468, preserved in the

British Museum, and which formerly belonged to Philip de Cluys, a Knight and Commander of the order of St. John of Jerusalem, has one or two early representations of the larger sort of cannon, which are here exhibited

Monstrelet illustrates the clumsy form as well as the clumsy management of ancient cannon. Under the year 1459 he says, 'while King James (of Scotland) was observing the effect of his artillery (at the siege of Roxburgh Castle), one of the rudely-contrived cannons of that age, consisting of bars of iron, girded with circles of metal, suddenly burst: a fragment struck his thigh, and the great effusion of blood produced a death almost instantaneous. The Earl of Angus, who stood next to James, was wounded.' Under 1478 he says, 'a great bombard, that had been cast at Tours, was brought to Paris the Monday before Epiphany to be proved, and was for this purpose drawn out into the fields in front of the bastille of St. Anthony. It was pointed towards Charenton, and when first fired threw the ball as far as the galleys on the bridge of Charenton; but as those present did not think it had discharged all the powder that had been put into the chamber, they ordered it to be re-charged and the chamber perfectly cleaned of all that remained within it, which was done, and an iron ball, weighing five hundred weight, put into its mouth, before which stood John Maugué, the founder of it. As the ball rolled down the bombard, by some unknown accident the powder in the chamber took fire before the match was put to it, and by its discharge tore in pieces John Maugué and fourteen other persons, whose heads, legs, arms and bodies were blown into the air. The ball killed a poor innocent bird-catcher that was attending his nets in the fields, and the bursting of the bombard

maimed fifteen or sixteen others, several of whom died; so that by this accident twenty-two or twenty-three persons lost their lives. The remains of John Maugué were collected, put on a bier, and carried to St. Merry for interment; and proclamation was made through the street of Paris that all people should pray for the soul of John Maugué, who had lost his life in the king's service.' (Johnes's *Monstrelet*, 4to., vol. iv. p. 402-403.) In 1477, when Louis XI. made his attack upon different towns of Flanders and Picardy, he ordered bombards of prodigious length and weight to be cast at Paris, Tours, Orleans and Amiens. His iron bullets were cast at the foundries at Creil, and his stone bullets made at the same time in the quarries near to Peronne.

From one or two of the preceding passages, it will be observed that the ancient method of constructing cannon had been changed about the middle of the fifteenth century for that of casting. Père Daniel (*Hist. de Milice Franc.* i. 450) tells us, that about the close of that period a hard and mixed metal was invented for this purpose, called *font-metal*, or *bronze*. Cannon, it should seem, were now cast one solid piece.

It is probably this same metal that Stowe alludes to in a passage of his *Annals*. He says, 'this year, 1535, John Owen began to make brass ordnance, as cannons, culverines, and such like. He was the first Englishman that ever made that kind of artillery in England; his issue of his name and the name of Pitt have continued unto the days of King James most ready and exquisite gun-makers for the general service of the kingdom.' A beautiful specimen of this sort of ordnance, cast at Utrecht in 1544, and presented by the States of Holland to Queen Elizabeth, is still preserved at Dover Castle. Other specimens, both English and foreign, a little later in period, may be seen at the Tower of London and in the Royal Arsenal at Woolwich as well as in many of the foreign arsenals. The sizes of cannon, generally speaking, in the sixteenth century, were considerably diminished, and forms of greater elegance were given to their exterior.

Robert Borthwick, an artist in the service of King James IV. of Scotland, had attempted the establishment of a foundry at Edinburgh a short time previously. Some of his guns, which remained in Lesly's time, had this inscription 'Machina sum Scoto Borthuik fabricata Roberto.'

The largest cast cannon now existing is a brass one at Bejapoor, called Malick é Meidān, 'the lord of the plain;' it was cast in commemoration of the capture of that place by the Emperor Alum Geer, in 1685. Its extreme length is 14 feet 1 inch; the diameter of its bore 2 feet 4 inches. An iron shot for this gun of proper size would weigh 1600 pounds.

For *Mortars* we are indebted to workmen who were employed by Henry VIII., and for cast-iron ordnance to the reign of Edward VI. Under the year 1543, Stowe says, 'King Henry, minding wars with France, made great preparation and provision, as well of munitions and artillery, as also of brasse ordnances, amongst which, at that time, by one Peter Bawd, a Frenchman born, a gun-founder, or maker of great ordnance, and one other alien, called Peter Van Collen, a gunsmith, both the king's feed men, who conferring together, devised and caused to be made certain mortar-pieces, being at the mouth from eleven inches to nineteen inches wide; for the use whereof the said Peter and Peter caused to be made certain hollow shot of cast-iron, to be stuffed with fire-work or wild-fire, whereof the bigger sort for the same had screws of iron to receive a match to carry fire kindled, that the fire-work might be set on fire, for to break in small pieces the same hollow shot, whereof the smallest piece hitting any man would kill or spoil him. And after the king's return from Boulogne, the said Peter Bawd by himself, in the first of Edward the Sixth, did also make certain ordnance of cast iron, of divers sorts and forms, as fawconet, fawkons, minions, sakers, and other pieces. Unto this Bawd, John Johnson, his covenant servant, surviving his master, did likewise make and cast iron ordnance cleaner and to better perfection, to the great use of this land. His son Thomas Johnson is yet living, a special workman. In the year 1595 he made forty-two cast pieces of great ordnance of iron for the Earl of Cumberland, demy cannons, weighing 6000, or three ton the piece.' (*Annals*, edit. 1631, p. 584.)

It appears from Sir William Monson's *Naval Tracts*, that the *Falcon* was a species of ordnance of two inches and a

half bore; weight of shot two pounds: that the *Demi-Culverin* was another kind, of four inches bore; weight of the shot nine pounds and a half: and that the *Mynton* was another of three inches and a half bore; weight of the shot four pounds. The *Culverin* was a species of ordnance of five inches and a half bore; weight of the shot seventeen pounds and a half. The *Fowler* is not described by Monson, but is mentioned by Lodge in his *Illustrations of British History*, vol. i. p. 4, as in use in the time of James I. The *Sacar* or *Saker*, according to Monson, was a piece of ordnance of three inches and a half bore; weight of shot five pounds and a half.

The invention of *Petards* is due to the French civil wars. They were first used by the Huguenots in 1580, at the siege of Cahors in Quercy. (Du Thou, tom. viii. p. 376.) Montelimar and Embrun in Dauphiné were taken by Lesdigéres in 1585, principally by means of petards. (*Ibid.* tom. ix. pp. 404, 405.) According to Père Daniel (cited in *L'Art de Vérifier les Dates*, tom. i. p. 655), red-hot balls, revived in 1782 at Gibraltar, were used by Marshal Matignon during the siege of La Fère in 1580. But we learn from Elmhams's Life of Hen. V., p. 155, that they had an earlier origin. He says, that when an English army, commanded by the Duke of Gloucester, besieged Cherbourg in 1418, the besieged discharged red-hot balls of iron from their cannon ('massas ferreas rotundas, igneis candentes fervoribus a saxivomorum faucibus studuerunt emittere') into the English camp, to burn the huts in which the soldiers were lodged.

The *Howitzer*, an improvement upon the mortar, is said to have been invented by Belidor, and was first used at the siege of Ath in 1697. The *Carronade*, a sort of short cannon, or rather long howitzer, was invented by General Robert Melville, about the year 1779.

Iron Rockets of different sizes, varying in weight from sixteen to more than forty pounds, were invented during the last war by Sir William Congreve, and are now called Congreve Rockets. They were first used at the bombardment of Copenhagen, afterwards against the Boulogne flotilla, then at Flushing, and subsequently at the battle of Leipzig. A rocket establishment now forms a regular branch of the British military service.

Besides the different works already quoted, Grose's *History of the Army of England*; Glenie's *History of Gunnery*; Henry's *History of Britain in the different Periods*; and Wraxall's *History of France*, have been consulted for the present article.

Among ancient engines of artillery the *Battering-ram* has been usually included, though it certainly is not embraced in the ordinary or in any other definition of that word. Pliny, whose authority in such a matter is small, says it was invented at the siege of Troy but Homer makes no mention of it. The first notice of this engine is probably in Ezekiel, where the prophet speaks of a feigned siege of Jerusalem as a sign for the Jews, ch. iv. v. 2.: 'set battering-rams against it round about;' and again, ch. xxi. v. 22, 'appoint battering-rams against the gate.' Ezekiel lived about 590 years B.C. The next mention of the battering-ram is in the Peloponnesian war, B.C. 429 (Thucyd. ii. 76); and we are certain that it was used a century afterwards at the siege of Motya by Dionysius the Elder. The ram was sometimes used, but not commonly, in the middle ages. (For the present mode of making Cannon see that article, and for the mode of using them see GUNNERY.)

ARTOCARPEÆ (or the Bread-fruit Tribe), a natural order of plants, nearly related to *Urticæ* (the Nettle Tribe), from which it is so difficult to separate them by any precise character, that there are many who consider them nothing more than a section of *Urticæ*. This opinion has been adopted by Dr. Lindley in his *Nixus Plantarum*.

Whether a distinct order, or a section only of *Urticæ*, the group of *Artocarpeæ* is known by its having flowers with a very imperfectly formed calyx, no corolla, leaves with conspicuous stipules, a rough foliage, and an acrid milky juice, which often contains caoutchouc in abundance; the flowers are collected into round heads, and the ovules are suspended singly from the upper part of the solitary cavity of the ovary. They are thus distinguished from true *Urticæ* by the position of their ovules, the manner in which their flowers are arranged, and by their yielding a milky juice; the juice of *Urticæ* is watery.

The species are all found in the warmer parts of the

world, and many of them are natives of the tropics only. Their milk, which is always acrid, renders some of them intensely poisonous, as the Upas tree of Java, and certain Indian species of fig; nevertheless, if the milk is naturally absent from any particular part of an *Artocarpeous* plant, that part becomes eatable and even wholesome. Thus the fruit of the cultivated fig, up to a short period before its maturity, remains milky, and at that time it would prove exceedingly unwholesome, but when ripe the milk disappears, is replaced by sugar, and the fruit becomes, as we all know, extremely wholesome. The same explanation is probably applicable to the case of the bread-fruit, which forms an article of food with the South Sea islanders.

With those writers who are too little acquainted with botany to understand the philosophical views which prevail at the present day, it is a favourite argument against the natural relations of plants being really represented by what are called natural orders, that the nettle and the fig are both arranged in the same order; and such persons appeal to what they call common sense, whether any relationship between a fig and a nettle can be seriously believed to exist in nature. If, however, they were capable of investigating the matter carefully, they would find that in structure of stem, leaves, stipules, calyx, stamens, and fruit, these two plants are so like each other, that it is impossible to discover more than one solitary essential character, namely, that of the position of the young seeds, by which they can be distinguished; and that the differences which meet the unpractised eye are entirely connected with the size and manner in which the flowers are arranged: we shall easily show this to be so. The nettle, that is to say, the wild English nettle, is an herb, the fig is a tree; but many species of the genus *Urtica*, of which the common nettle is one, are trees also; consequently, in an extended point of view, the nettle and the fig are not essentially distinct in regard to their general habit. But if it were otherwise, the nettle would not be the less allied to the fig; for a tree is nothing but an herb which continues to grow many years; and longevity does not interfere in any degree with relationship. This disposes of the distinction which consists in size. Next, as to the manner in which the flowers are arranged. In the nettle the flowers are disposed in loose branched clusters; in the fig they are collected within a fleshy receptacle, which is so much contracted to a point as to form a hollow case. These are extremes of structural difference in regard to arrangement; but intermediate forms of arrangement occur which reduce these differences to nothing. It is true that in the common nettle the flowers are disposed in loose branched clusters; but in the Roman nettle (*Urtica pilulifera*) they are collected into round heads; a loose arrangement of the flowers is, consequently, not a character of even the nettle itself. In the genus *Procris*, which is closely related to the nettles, the flowers are also collected into heads, and, in addition, the part which bears the flowers is pulpy. Here is one step towards the formation of the receptacle of a fig. In the genus *Dorstenia*, the part which bears the flowers is also fleshy, but so much extended horizontally as to form a sort of saucer, the edges of which are curved inwards. This brings us so exceedingly near the receptacle of the fig, that if the edges of the saucer-shaped receptacle of *Dorstenia* were only curved inwards till they met, its apparent fruit would actually be a fig: we say apparent, because, however strange it may seem to make such an assertion, there is, in fact, very little difference between the true fruit of the nettle and the fig; in both it consists of minute lenticular grains, each containing a single seed; but in the nettle it lies among the dry chaff of the calyx and bracts, while in the fig it is buried among the flesh of the receptacle and succulent calyxes.

The essential differences between a nettle and a fig are thus demonstrated to be much more apparent than real. We do not usually enter so much into arguments touching speculative opinions as we have on this occasion; but the objection, which we have thought it worth answering, is a popular one, which it appears desirable to set at rest in a popular work.

ARTOCARPUS, or the Bread-fruit, is the genus which has given its name to the preceding natural order. It consists of trees having stems of very considerable size, large leaves, which are exceedingly rough with little points; stipules like those of the fig, and monœcious flowers, of which the stamen-bearing ones are disposed in long club-shaped spikes (*fig. A 3*), and the pistil-bearing ones in round heads

(fig. A 2), which become the fruit and often arrive at a very considerable size (fig. A 4.)

A Bread-fruit is a fig turned inside out, and much larger in all its parts; that is to say, the flowers which form the Bread-fruit and fig grow, in both cases, upon a fleshy receptacle; but in the former the receptacle is solid and bears its flowers externally, while in the latter it is hollow and bears its flowers internally.

The stamen-bearing flowers of *Artocarpus* (fig. B, C) consist of a tubular calyx containing a single stamen; the pistil-bearing flowers (fig. D), consist of two or three fleshy sepals grown closely together and meeting at the points, between which passes a long slender style with two stigmas, which are hairy and curved downwards. The ovary is simple, and contains but one ovule. At a very early period their flowers grow firmly together into a solid fleshy mass, which finally becomes the fruit. The seeds are large nut-like bodies, which lie beneath the rind of the fruit.

Many species are known, some of which, as *Artocarpus Chaplasha* and *hirsuta*, are large trees, and yield valuable timber in the forests of Bengal and Malabar. The only two, however, we propose to notice here are the Bread-fruit and the Jack.

[*Artocarpus incisa*.]

A, a shoot very much less than the natural size with stamen-bearing flowers 3; pistil-bearing flowers 2; fruit 4; and its stipules 1; B, a stamen-bearing flower; C, the same opened; D, three pistil-bearing flowers, sliced open at the bottom to show the ovaries; E, a portion of the fruit showing the nuts in the inside.

The Bread-fruit (*Artocarpus incisa*) is a native of the South Sea islands, and of many parts of the Indian Archipelago; it inhabits only such places as are both hot and damp; Dr. Roxburgh complains that the *winters of Bengal are much too cold for it*. It there forms a moderate-sized tree, rarely exceeding forty feet in height, with leaves deeply divided into sharp lobes, and sometimes as much as three feet long. The fruit is green and of considerable size, equalling a melon of the larger kind in dimensions, and is of many different forms: one variety produces it free from all spines on the surface or from seeds internally; this is the best sort: others are split into deep lobes, or covered all over with the sharp-pointed fleshy tops of the calyxes. The nuts, when roasted, are said to be as excellent as the best chestnuts; but it is principally for the fleshy receptacle that it is valued. When roasted it becomes soft, tender, and white, resembling the crumb of a loaf;

but it must be eaten new, or it becomes hard and choky. Others compare the flavour to that of a roasted potato; what we have tasted has been in thin slices which had been thoroughly dried, and it was very like a piece of dried biscuit. In Anson's voyages it is said to be delicious when ripe, and, when mixed with lime or orange juice, to have a grateful tart flavour, not unlike apple-sauce.

It forms so important a part of the support of the South-Sea islanders that it was introduced by the British Government into the West Indies, where it is still cultivated, and whence it has been carried to the continent of America. It does not appear, however, equal to the Plantain as an article of human food.

The Jack (*Artocarpus integrifolia*) is also a native of the islands of the Indian Archipelago, and is in its general appearance like the Bread-fruit, but its leaves are totally destitute of all laceration, and its fruit, which is very prickly, weighs 60 or 70 lb. This latter is yellow, and constitutes the principal part of the diet of the natives in some parts of India; but it is said to have an offensive odour, and to be little esteemed by Europeans: all, however, concur in attesting the excellence of the nuts when roasted.

Like all other Artocarpeous plants, this exudes a great quantity of a viscid milky juice, from which the best bird-lime of India is prepared. See the 2d volume of the new series of the *Botanical Magazine* for an excellent account of both the Jack and the Bread-fruit, illustrated by figures, by Dr. Hooker.

ARTOIS, a former province of France, now comprehended in the department of Pas-de-Calais. While the old divisions of France existed, Artois was bounded on the N.E. by French Flanders, on the E. by French Hainault and by Cambresis, and on all other sides by Picardie. Former authorities give its length as twenty-five leagues, or sixty-nine miles, and its breadth as about half that distance; but, measured on the *Map of France in Provinces*, published by the Society for diffusing Useful Knowledge, it is eighty miles long N.W. and S.E., and forty broad.

Artois is a flat country. The line of greatest elevation, as determined by the course of the waters, is from S.E. to N.W. On one side of this line, the Aas, and the Scarpe and Sensée (two tributaries of the Schelde), flow to the N.E.; and on the other side the Canche and Authie flow parallel to each other, into the English Channel. The soil is admirably suited for grain, in which it is very productive; but fruit trees do not succeed. Wood is scarce, and is used as fuel only by persons in easy circumstances. The poor burn coal or peat. The population, as given in the *Encyclop. Methodique*, Paris, 1782, was 300,000. That of the department of Pas de Calais, which comprehends Artois and a small part of Picardie, was, in 1826, 643,000.

The capital was Arras, and among the other chief towns were St. Omer, Bethune, Aire, St. Pol, Lens, and Bapaume. [For which see the articles AIRE, ARRAS, BETHUNE, OMER, ST., PAS DE CALAIS, and POL, ST.]

Artois takes its name from the people who formerly inhabited it, the Atrebatas (from whose designation, also, the capital was called Arras); although the limits of this tribe were hardly so extensive as those of the modern province. It was one of the early acquisitions of the Franks; in whose time the name Atrebatas, applied to the city Arras, was corrupted into Adertes or Adratas, and the province seems to have got the name of Pagus Adertisus. Charles the Bald gave it, in 863, as a dowry with his daughter Judith to Baldwin, Count of Flanders, surnamed *Bras de Fer*, or the iron arm. It reverted to the crown on the marriage of Philip Augustus with Isabel of Hainault in 1180. In 1236 it was made a county by Louis IX. (St. Louis), in favour of his brother Robert. After coming to the house of Burgundy, and forming part of the dominions of those powerful princes, it was seized by Louis XI. of France. Charles VIII., son of Louis, ceded it to the Emperor Maximilian, reserving however the feudal sovereignty; and it remained in the house of Austria till 1659, when it was yielded by Spain (for it had gone with the Spanish branch of that race) to France, with which it has been united ever since.

The ex-King of France, Charles X., was known in the early part of his life by the title of Count d'Artois. (*Ency. Methodique*; *Diction. de Martinière*, &c.)

Previous to the revolution, Artois appears to have enjoyed several privileges and immunities. It had its council for the management of civil affairs, consisting of three constituent bodies, the clergy, the nobility, and the commons

(*hiers états*). This council seems to have regulated the levying of the taxes which were imposed by the king, and to have granted exemptions in cases where the pressure was very heavy.

ARTOTYRITES. [See HERETICS.]

ARTS, DEGREES IN. Dr. Brett, in a Dissertation on Degrees in the Universities, published in 1722, in the first Number of the *Bibliotheca Literaria*, states his belief that degrees, such as are now given in our universities, originated with the incorporation of those bodies in the eleventh and twelfth centuries. Previous to this period, the distinctions were for the most part of masters and scholars only, as in our grammar-schools of the present day.

The term *master* is believed to be the oldest among those of graduation. Eugenius II. by the 34th canon of a council held at Rome in 826, mentions the appointment of *magistri* and *doctores* in the same sentence:—‘*ut magistri et doctores constituantur, qui studia literarum, liberaliumque artium, ac sancta habentes dogmata assidue doceant*’ (that masters and doctors be appointed who may continually teach the knowledge of learning and the liberal arts, and the received opinions in religion). This was confirmed by a decree of Leo IV. in another synod at Rome, in 853. (Muratori, *Antiq. Ital.*, tom. iii. col. 830.)

Du Pin (*Nouvelle Bibliothèque des Auteurs Ecclesiastiques*, 4to. Paris, 1700, tom. x., p. 171) is of the same opinion with Dr. Brett. He states that the academies or universities which were originally established, were in the thirteenth century reduced to form. That of Paris, which had begun to be formed in the preceding century, had grown famous from the number of its scholars, and for the masters with which it furnished all Europe. In its origin, he adds, it was composed of *artists*, who taught the sciences and philosophy; and of *Divines*, who made commentaries on Peter Lombard’s *Book of Sentences*, and explained the Holy Scriptures. Mention of these two faculties only occurs in the constitutions made for the university by the Cardinal di S. Stefano, legate of Pope Innocent III., in 1215. The whole number of arts was originally *seven*, and these were distributed into the *trivium*, comprehending grammar, logic, rhetoric; and all the *quadrivium*, comprehending music, arithmetic, geometry, astronomy. *Artiductor* and *artista* are ancient names for masters of arts, mentioned by Du Cange.

Gregory IX., whose pontificate continued from 1227 to 1241, is said first to have instituted the inferior rank of *bachelors*; whose name was derived from *bacilla* (little staves), either because they were admitted by receiving a little wand, or because as following the title adopted for the novices of the soldiery, who exercised with sticks, in order to learn to fight with arms. The bachelors were exercised in disputations, of which the masters were the moderators. Much upon the etymology of the names of bachelor and master may be seen in Baumeister’s *Antiquitates Rostochienses*, in the third volume of the *Momumenta Inedita Rerum Germanicarum*, fol. Lips. 1743, col. 953. The honours conferred upon learned men, in the form of these degrees, greatly increased the number of scholars in all the universities of Europe.

From several passages in Wood’s *History and Antiquities of the University of Oxford*, there can be little doubt but that the degrees both of bachelor and master of arts were conferred there in the time of Henry III. and the degree of master of arts probably much earlier. The *Laus* are said to have come into the university in 1149. (Gutch’s edit. of Wood, vol. i. p. 52.)

Wood, quoting the commentaries of one Whetley upon Boëthius, written in the time of Edward the First, says, ‘When the said bachelor was created master, the chancellor gave him the badges with very great solemnity, and admitted him into the fraternity with a kiss on his left cheek, using these words, “*En tibi insignia honoris tui, en librum, en cucullum, en pileum, en denique amoris mei pignus, ocellum; in nomine Patris, et Filii, et Spiritus Sancti.*”’ (Ibid., p. 59.)

The examination for the degree of B.A. (bachelor of arts) in *Oxford* at present consists—

I. In a public examination called *responsions*, that is, the answering of questions publicly proposed by the masters of the schools. This exercise consists of an examination in the Greek and Latin languages (chiefly with a view to their grammatical construction), in the rudiments of logic, or a portion of Euclid’s *Elements of Geometry*.

This examination is undergone by those students who have been matriculated not less than six, and not more than nine terms: it is a kind of preliminary examination, which, in the opinion of some persons, would be more appropriate if enforced at the time of the student’s admission into the university.

II. In a *final examination*, comprising—1. The rudiments of religion, under which head is required a competent knowledge of the gospels in the original Greek—of the history of the Old and New Testament—of the thirty-nine articles of the Church of England—and of the evidences of religion natural and revealed. 2. The *Literæ Humaniores*, under which head is comprised a sufficient acquaintance with the Greek and Latin languages and ancient history—with rhetoric and poetry—with moral and political science, as derived from the ancient Greek and Roman writers, and illustrated, if need be, from modern authors; with logic (which is indispensably required from all candidates for the first, second, or third classes), and with the art of composition. 3. The elements of the mathematical sciences and of physic.

With regard to the examination in some parts of the *Literæ Humaniores*, and in the elements of the mathematical sciences, and of physics, the examiners have a discretionary power. No knowledge of mathematics or of physical science is indispensable; and a man may obtain the highest honours and still be totally ignorant of these branches of learning. They are however bound to examine all candidates in at least three Greek and Latin classical writers, in logic, or the first four books of Euclid, and to ascertain their proficiency in translating from the English into the Latin language. With respect to the rudiments of religion, they possess no discretionary power; and any failure in this part of the examination must preclude the candidate from his degree, without any regard to his other attainments.

After the candidates have been examined, the names of those who have honourably distinguished themselves by passing a good examination in a wider range than that necessary for the mere degree, are distributed, in alphabetical order, into four classes, together with the names of their colleges, under the two divisions of *Literæ Humaniores* and *Disciplina Mathematica et Physica*. A fifth class gives the *number*, without mentioning the names of those who, having obtained their *testimonium*, are not deemed worthy of any honourable distinction. Printed copies of the schedule containing these classes are sent to the chancellor, to the vice-chancellor, to the heads of houses, to the proctors, and to the refectory and common room of each college and hall.

In *Cambridge*, those who proceed to the degree of B.A. also undergo a previous examination (known in ordinary conversation by the name of the *little go*), in the second year of their undergraduate course, the subjects of which are, one of the four Gospels or the Acts of the Apostles, in the original Greek; Paley’s *Evidences of Christianity*; and one of the Greek, and one of the Latin classics, or a part of such books.

The next step is termed the keeping of an act, under a moderator. [See ACT.]

The *Senate-House Examination*, which follows in the fourth year, is conducted under other regulations. This examination is now extended to eight days.

The examination of those who contend for *Honors* is conducted according to regulations confirmed by a grace of the senate, April 6th, 1832, and which were brought into use in January, 1833. It consists in five days of examination in mathematics, commencing on the Thursday preceding the first Monday in Lent Term; the time of examination each day being five hours and a half, and the candidates being arranged in four classes, determined by the public exercises in the schools, and sometimes by the report of their college tutors. [See ACT.] The examination on the first day extends only to such parts of pure mathematics and natural philosophy, as do not require the methods of the *differential calculus*. On the second and third days, the questions from books include, in addition to the above subjects, the parts of natural philosophy somewhat more advanced, and the simpler applications of the *calculus*. The fourth day the examination extends to subjects of greater difficulty, care however being taken that there be some questions suitable for the lower classes. On the fifth day the classes are arranged for examination according to a settled plan, when the questions proposed to all the classes

are fixed upon by the moderators and examiners in common; but the duty of examining the answers to the questions is apportioned amongst the moderators and examiners as the plan directs. The result of the examination is published in the senate-house on the morning of the following Friday, at eight o'clock, when the names of all those who have obtained honors are arranged in *brackets*, as it is termed, the first bracket of course containing the names of those who occupy the highest place. If more than one name is in a bracket, which is nearly always the case, the places of such candidates are finally determined by a fresh examination on that day.

The examination of the other candidates for degrees, viz., the fifth and sixth classes who are *not candidates for honours*, takes place according to another plan, confirmed by grace of the senate, May 21, 1828.

Of the six examiners of these candidates, two confine themselves to the mathematical subjects; two to Homer and Virgil; and two to Paley's *Evidences*, Paley's *Moral Philosophy*, and Locke's *Essay on the Human Understanding*.

The examination is conducted entirely by printed papers. Each of the Euclid papers contains twelve propositions, selected from the first four books, with additional questions in the fifth, sixth, and eleventh books, and in trigonometry, at the discretion of the examiners. Each paper in arithmetic and algebra consists of questions entirely elementary: to which are annexed questions in the elementary parts of natural philosophy, at the discretion of the examiners. The papers in Homer and Virgil consist of passages to be translated, which may be accompanied with such plain questions in grammar, history, and geography, as arise immediately out of those passages. The examiners are strictly enjoined to take care that the number of questions to be answered, and the length of the passages to be translated, in any one paper, do not exceed what a person well prepared may be expected to answer and translate in the time allowed.

Upon the completion of the examinations both of those who contend for honours and of the others, a select number, thirty at least, of those who have most distinguished themselves in the first four classes, are recommended to the proctors for their approbation, and their names are set down according to merit, and classed in three divisions, viz., wranglers, senior optimes, and junior optimes, which constitute the three orders of honour; the fifth and sixth classes are also arranged numerically according to merit, but are not published in the Calendar. The candidates, having separately taken the oaths of allegiance and supremacy, and to observe the statutes of the university, and having also subscribed that they are *bonâ fide* members of the Church of England, are admitted to their degrees.

In addition to the examination thus described, an examination in classical learning of such persons as shall voluntarily offer themselves to be examined, follows on the fourth Monday after the general admission to the bachelor's degree. This continues four days. Translations are required of passages selected from the best Greek and Latin authors, as well as written answers to questions arising out of such passages; together with other exercises, but no original composition. The names of those bachelors who pass this examination with credit are arranged in three classes according to their respective merits.

Sixteen terms are required for the degree of bachelor of arts in *Oxford* from all except the sons, and eldest sons of the eldest sons of English, Scotch, and Irish peers, and of peeresses in their own right, as well as baronets, and the eldest sons of baronets and knights, when matriculated as such, and not on the foundation of any college; all such persons are allowed to be candidates for the degree after having completed three years. But of these sixteen terms, the day of matriculation, if it be in term, counts for one, and the day of admission to a bachelor's degree for another, and two more are dispensed with by congregation; so that, in point of fact, residence for twelve terms only is necessary.

In *Cambridge*, a bachelor of arts must also reside the greater part of twelve several terms, the first and last excepted.

In both Universities, the degree of M.A. is conferred without further examination. In *Oxford*, twelve terms are computed before the bachelor can be admitted M.A., though he is required to be actually resident for one term only. In *Cambridge*, a master of arts must be a bachelor of three

years' standing, reckoned from the second Tripos Day following his admission to the bachelor's degree.

Bachelors of arts in both Universities, though graduates are considered to be *in statu pupillari*, that is, they are still under nearly the same discipline and control as the under-graduates, except attendance on college lectures. The legislative bodies of the Universities consist of those who are masters of arts or who have taken a higher degree.

Masters of arts, in both Universities, wear a gown of Prince's stuff, with a semicircular cut at the bottom of the sleeves. The Oxford hood, for a master, is of black silk lined with crimson. At Cambridge, if the master is a non-regent, he wears a silk hood entirely black; if regent, it is black lined with white.

The Bachelors of both Universities wear black gowns of Prince's stuff; that of Oxford is with a full sleeve, looped up at the elbow, and terminating in a point. At Oxford, the bachelor's hood is edged with fur: at Cambridge, it is lined with lamb's wool. Representations of the dresses may be seen in Ackermann's *Hist. of the Univ. of Oxford*, 4to. Lond. 1814, vol. ii. p. 261; *Hist. of Camb.* 4to. Lond. 1815, vol. ii. p. 310.

For further information on the education of Oxford and Cambridge, particularly with reference to the degree of B.A., the fees, &c., see *Journal of Education*, Nos. I. III. IV. VIII. X. XIII. XV.; on that of Dublin, Nos. XI. XII.; and on the Scotch Universities, Nos. VII. VIII. IX.; and also the Oxford, Cambridge, and Dublin *Calendars*.

ARTS, FINE. The fine arts are generally understood to comprehend those productions of human genius and skill which are more or less addressed to the sentiment of taste. They were first employed in embellishing objects of mere utility, but their highest office is to meet our impressions of beauty or sublimity, however acquired, by imitative or adequate representation. The capacity of the human mind for receiving such impressions, whether directly from nature or through the medium of the arts, depends greatly on civilization, and that leisure which supposes that first wants are satisfied; but there exists no state of society, however ignorant, in which some symptoms of taste and some attempts to arrest the beautiful are not to be met with: the difference between such efforts and the most refined productions is a difference only in degree; the fact of the existence of the arts in some form may be always taken for granted, and it would only remain to regulate their influence and direct their capabilities aright.

The arts are peculiarly interesting as human creations. They are composed of nature operating on human sympathies, and reflected through a human medium; and as nations, like individuals, present ever-varying modifications, so the free growth of the fine arts partakes of all these varieties, and may be compared to the bloom of a plant, true to its developing causes whatever they may be, and nurtured in the first instance by the soil from which it springs. In barbarous or degenerate nations, the sentiment of the beautiful has ever been attained only in the lowest degree, while a false excitement, founded on the suppression of the feelings of nature, may be said to have usurped the place of the sublime. We smile at the simple attempt of the savage to excite admiration by the gaudiness of his attire; but we should shudder to contemplate the scenes which his fortitude or obduracy can invest with the attributes of sublimity. The just value of life, the characteristic of that civilization which reduces the defensive passions to their due limits, at the same time naturally elevates the sources of gratification by pointing out the pleasures of the mind as distinguished from those of sense; and the perception of the beautiful is in its turn the cause, as it is in some degree the result, of the rational enjoyment of life.

The great use of the arts is thus to humanize and refine, to purify enjoyment, and, when duly appreciated, to connect the perception of physical beauty with that of moral excellence; but it will at once be seen that this idea of usefulness is in a great measure distinct from the ordinary meaning of the term as applicable to the productions of human ingenuity. A positive use results, indeed, indirectly from the cultivation of the formative arts, precisely in proportion as their highest powers are developed: for it will be found that at all times when the grandest style of design has been practised with success, and particularly when the human figure has been duly studied, the taste thus acquired from the source of the beautiful has gradually influenced all kinds

of manufactures. Again, as illustrating science, the fine arts may be directly useful in the stricter sense, but this is not the application which best displays their nature and value. The essence of the fine arts, in short, begins where utility in its narrower acceptation ends. The abstract character of ornament is to be useless. That this principle exists in nature we immediately feel, in calling to mind the merely beautiful appearances of the visible world, and particularly the colours of flowers. In every case in nature, where fitness or utility can be traced, the characteristic quality or *relative* beauty of the object is found to be identified with that fitness;—a union imitated as far as possible in the less decorative parts of architecture, furniture, &c.; but where no utility save that of conveying delight (perhaps the highest of all) exists, we recognise the principle of *absolute* beauty. The fine arts in general may be considered the human reproduction of this principle. The question of their utility therefore resolves itself into the inquiry as to the intention of the beauties of nature. The agreeable facts of the external world have not only the general effect of adding a charm to existence, but they appeal to those susceptibilities which are peculiarly human, and it becomes necessary to separate the instinctive feelings which we possess in common with the rest of the creation, from that undefinable union of sensibility and reflection which constitutes taste, and which, while it enlists the imagination as the auxiliary of beauty, is, in its highest influence, less allied to love than admiration. It is this last feeling which the noblest efforts of the arts aspire to kindle, which not only elevates the beautiful, but reduces ideas of fear and danger to the lofty sentiment of the sublime, which, as its objects become worthier, is the link between matter and mind, and which tends to ennoble sympathy and increase self-respect.

With regard to the classification of the arts, those are generally considered the most worthy in which the mental labour employed and the mental pleasure produced are greatest, and in which the manual labour, or labour of whatever kind, is least apparent. This test would justly place poetry first; but the criterion should not be incautiously applied; for in architecture, where human ingenuity is most apparent, and even where the design is very simple, a powerful impression on the imagination may be excited from magnitude, proportion, or other causes. In such cases, however, it will still be evident that we lose sight of the laborious means in the absorbing impression of the effect, and the art thus regains its dignity. It would be an invidious as well as a very difficult task to assign the precise order in which painting, sculpture, architecture and music, would follow poetry and its sister, eloquence; but it may be remarked, that the union of the arts is a hazardous experiment, and is often destructive of their effect. This is most observable in the attempts to combine the principles of sculpture and painting. The drama itself, which unites poetry with many characteristics of the formative arts, and with music, is in constant danger of violating the first principles of style, viz., the consistency of its conventions; and in the more intimate union of poetry and music, the latter, though the inferior art, is too independent and too attractive to be a mere vehicle, and accordingly usurps the first place. [See the Arts above-mentioned under their respective heads.]

ARUM. [See AROIDEÆ.]

ARUNDEL, a borough town in the rape of Arundel, in the county of Sussex, on the river Arun, a short distance from the sea; 55 miles S.S.W. from London, and 10 E. by N. from Chichester. It stands on a declivity on the N.W. bank of the river, the course of which is very winding in this neighbourhood: 50° 51' N. lat., 0° 33' W. long.

The houses are tolerably well built, and the streets paved. The trade of the place is not very great, though vessels of 150 tons can come up to the town, and a canal unites the river on which it stands with the Wey, a feeder of the Thames. There is, however, a good deal of bark shipped, as well as much timber for the use of the dockyards. The custom-house being at Arundel keeps up the business of the place, which might otherwise be drawn away to Little Hampton, about four miles distant, on the east bank of the Arun, at its mouth. The population of Arundel in 1831 was 2803. The number of houses rated to the house tax at 10*l.* and upwards was, at the same time, 120: the whole number of houses was 537, twenty of which were uninhabited. There are two weekly markets (Wednesday and Saturday), and four annual fairs (May 14,

August 21, September 25, and December 17), chiefly for cattle. There is also a theatre.

A neat stone bridge, of three arches, over the Arun, unites the main part of the town with a smaller portion which lies on the opposite bank of the river. The church is a handsome Gothic structure, built partly of flint and stone, in the form of a cross, and mostly in the perpendicular style. From the intersection of the cross rises a low tower. The chancel has a north aisle, and contains many monuments of the former owners of the castle and others. It is now shut up, and in a very dirty, dilapidated state; but the nave and transepts, which are used for divine service, are kept in good repair and clean. A pulpit of stone, supported on wood, standing against the south-west pier of the cross, was till lately used in divine service. This church belonged originally to a priory of Benedictines, subject to the abbey of Sees in Normandy; but the priory was suppressed in the time of Richard II., and a chantry, or college, for a master and twelve secular canons, with other officers, was founded in its place. Southward from the church is a range of buildings, seemingly founded on the ruins of an ancient structure, which was perhaps the habitation of the above-mentioned canons. A hospital, called 'Maison Dieu' (God's House), was founded in the time of Richard II., by one of the Fitz Alans, for the maintenance of as many poor as its revenues would permit. It was suppressed at the Reformation, when its income was estimated at 42*l.* 3*s.* 8*d.* per annum.

The most striking feature in Arundel is the ancient castle, which gives to its possessor (now the Duke of Norfolk) the title of Earl of Arundel. This instance of a peerage attached to the tenure of a house is now an anomaly. In 11 Henry VI. it was decided, that the tenure of the Castle of Arundel alone, without any creation, patent, or investiture, constituted its possessor Earl of Arundel. (Nicolas' *Synopsis of the Peerage*, 27; Cruise's *Digest*, 3 vols. 152; Report of the Lords' Committee respecting Peerage, 1820.) In 3 Charles I. the Earl of Arundel obtained an Act of Parliament, intitled, 'An Act concerning the title, name, and dignity, of Earl of Arundel, and for annexing of the castle, honor, manor, and lordship, of Arundel, in the county of Sussex, with the titles and dignities of the baronies of Fitzallan, Clun, and Oswaldestre, and Maltravers, with divers other lands, tenements, and hereditaments, in the Act mentioned, being then parcel of the possessions of Thomas, Earl of Arundel and Surrey, Earl Marshal of England, to the same title, name, and dignity, of Earl of Arundel.' (Report of the Lords' Committee respecting Peerage, p. 374.)

The castle stands high, on a steep circular knoll, partly natural, partly artificial, close to the town, and commands an extensive prospect over the low flat country towards the sea as far as the Isle of Wight. It has been supposed that the sea once washed the castle walls, as anchors and other marine implements have been found near it. Arundel castle is mentioned as early as the time of King Alfred, who bequeathed it by his will to his nephew Adhelm. After the Norman Conquest, it was given by William I. to his kinsman Roger de Montgomeri, created Earl of Arundel and Shrewsbury. Robert, one of the successors of this earl, supported Robert Duke of Normandy, the eldest son of William I., against Henry I., the youngest son of the Conqueror. Afterwards the castle passed into the family of Albini, from them to the Fitz Alans, and at last, by the marriage of the heiress of this race with Thomas Duke of Norfolk (in the reign of Elizabeth), into the family of the Howards, by whom it is still retained.

In the civil war between Charles I. and his parliament, Arundel castle was held and garrisoned by the latter. It was, however, taken by Lord Hopton in 1643, surrendering to him at the first summons, and two months after was as suddenly retaken by Sir William Waller. From that time it continued little better than a mass of ruins, until it was restored by the late Duke of Norfolk to its ancient magnificence. A considerable portion of the old building was demolished on this occasion. The modern parts are in the Gothic style, built of free-stone; and stones of a brown cast were selected, in order to accord better with the remains of the ancient fabric.

The castle is surrounded on the N. and W. sides by a deep ditch. The entrance gateway, antiently defended by a drawbridge and a portcullis, was built by Richard Fitzalan

in the reign of Edward I., and repaired and restored by one of his successors. This, with some of the walls and the keep, is all that remains of the ancient castle. The keep is a circular stone tower 68 feet in diameter, and the most perfect in England. In the middle of it is the dungeon, a vault about 10 feet high, accessible by a flight of steps, and about 15½ feet by 9½ in extent. The keep has been long tenanted by some owls of large size and beautiful plumage, sent over from America, as a present to the late duke. Among the interior apartments of the castle may be mentioned the magnificent library, calculated to contain 10,000 volumes, and built in imitation of the aisle of a Gothic cathedral; the ornamental parts are in imitation of the cloisters at Gloucester, and St. George's, Windsor. It is 122 feet long, and 30 feet wide. The ceiling, columns, &c., are entirely of mahogany. The great hall, called 'the Barons' Hall,' was begun in 1806; it is 70 feet by 34, and 36 feet high. The roof is of Spanish chestnut, curiously wrought, and the plan is taken from Westminster, Eltham, and Crosby Halls. There is at one end a window of stained glass, representing King John signing Magna Charta. In a series of thirteen stained glass windows are portrayed the figures of some of the barons from whom the late Duke was descended; and there are also portraits of his family. In the dining-room is a handsome stained glass window, representing the late duke and duchess as King Solomon and the Queen of Sheba at a banquet; and a painting by Le Brun, of Adam and Eve in paradise, in imitation of *basso rilievo*.

The park is very extensive and finely wooded, including a great variety of picturesque scenery. In the *Museum Rusticum*, i, 85, we are informed, that the country round Arundel was covered with vineyards, from which wine was made; and that, in 1763, there were sixty pipes of excellent wine, resembling Burgundy, in the cellar of the castle, the produce of one vineyard attached to it.

The town was incorporated by Queen Elizabeth, and the corporation consists of a mayor, twelve burgesses, a steward, and other officers. The mayor is chosen annually at the court leet of the lord of the manor, and is a justice of the peace within the borough. The town has been represented in parliament ever since the 30th of Edward I. The franchise was in the inhabitants paying scot and lot; and up to the passing of the Reform Bill they returned two members. The Duke of Norfolk having fixed his residence at the castle, and made considerable purchases in the town, acquired the power of influencing the return of both members. By the Reform Bill the number of representatives was reduced to one; but the boundaries of the borough (which are coincident with those of the parish) remained unaltered, though it had been proposed by the commissioners of boundaries, in their report, to add the parishes of Leominster and Little Hampton, which would have swelled the population to 5039 persons. The proposal of the commissioners met, however, with violent opposition; a committee of the house was appointed to consider their report, and a surveyor sent down from London to make a fresh examination. Upon his report the house acted, and abstained from any alteration in the boundary. The living is a discharged vicarage, in the diocese of Chichester. Arundel is the seat of a deanery, and gives name to one of the *rapes** into which Sussex is divided. This division is of Saxon origin, and the name is peculiar to Sussex.

The river Arun, on which the town stands, rises in St. Leonard's Forest, in the northern part of the county. Its course is not less than forty miles. It is famous for the grey mullets (which, in the summer, come up to Arundel in large shoals in quest of a particular weed, the feeding on which renders them a great delicacy); and also for eels.

ARUNDEL MARBLES, certain pieces of sculpture, consisting of ancient statues, busts, mutilated figures, altars, inscriptions, &c., the remains of a more extensive collection, formed in the early part of the seventeenth century by Thomas Howard, Earl of Arundel, and presented, at the suggestion of John Evelyn, in 1667, to the University of Ox-

ford, by Mr. Henry Howard (afterwards Duke of Norfolk), the Earl of Arundel's grandson.

Thomas Howard, Earl of Arundel and Surrey, the founder of this collection, was the only son of Philip, first Earl of Arundel of his family, by Anne, sister and co-heir of Thomas, the last Lord Dacre of Gillesland. The year of his birth is fixed by Sir Edward Walker, in his *Historical Discourses*, to 1586. He received his education at home, under the eye of his mother, with whom he lived, in the latter years of Elizabeth's reign, in privacy. He had at that time, by courtesy, the title of Lord Malt'avers, a barony derived from his great ancestors, the Fitzalans.

In 1603, soon after James's accession, he was restored in blood by act of parliament, and to such honours as he had lost by his father's attainder, as well as to the earldom of Surrey, and to most of the baronies which had been forfeited by the attainder of his grandfather, Thomas, fourth Duke of Norfolk. The dukedom itself was detained from him. Lodge conjectures that the Earl of Suffolk, Lord Arundel's uncle, who was then in favour, might have prevented that grace, with the hope of obtaining a revival of it in his own line, in the event of the young earl's death without issue.

When Lord Arundel came of age, he married Alatheia, third daughter and co-heir of Gilbert Talbot, Earl of Shrewsbury; a match of great advantage, as her two elder sisters, the countesses of Pembroke and Kent, dying childless, she ultimately inherited the most part of her father's noble revenues.

In 1607 the Earl of Arundel was sworn of the privy council; and on the 17th of June that year, the king stood godfather in person to his first-born son. He soon after travelled into France and Italy, a journey which his untoward family circumstances had hitherto prevented; and during his stay in those countries he imbibed that love for the fine arts by which he was afterwards distinguished.

He remained abroad till 1611, and on his return was made K.G. The marriage of the Princess Elizabeth to the Elector Palatine happening soon after, he was appointed to escort them to their dominions. Finding himself once more on the continent, he went again into Italy, and at that time began to form his celebrated collection. When he returned to his own country, in 1614, he embraced the communion of the Church of England; for he had been bred a Roman Catholic in the strictest austerities of that persuasion. In 1621, upon Bacon's removal, he was made one of the commissioners for holding the great seal; and, in the same year, appointed, or rather restored, to the place of Earl Marshal of England.

King Charles I., upon his accession, continued him in this last office, and showed him several other indications of favour; but the earl's eldest surviving son, Henry Lord Maltravers, having married the Lady Elizabeth Stuart, sister of the Duke of Lenox, who was related to Charles, the king showed his resentment by an act of violence, which drew a remonstrance from the House of Peers. It had been the king's intention to marry this lady to Lord Lorne, the son of the Earl of Argyle, and so to reconcile the ancient feuds between those two powerful Scottish houses. Lord Arundel was committed, together with his lady, to the Tower, solely by the authority of a royal warrant, in which his offence was not stated. The Lords, however, continued firm in his defence, and after a contest which lasted nearly three months, he was set at liberty June 8, 1626.

After the assassination of the Duke of Buckingham, the Earl of Arundel, who had been the duke's enemy, came again to court, and soon acquired a considerable share of favour and confidence. In 1631 he was appointed a commissioner to examine into the extravagant fees exacted in courts of justice and public offices, and in 1633 attended the king at his coronation in Scotland: in the same year he was deputed ambassador extraordinary to the States-general, and was made chief-justice of the forests north of Trent. But his most important public service about that period was in an embassy, in 1636, to the Emperor Ferdinand II. and the Imperial Diet, on the subject of the restoration of the palatinate to the elector, Charles's nephew; a measure which the king had so entirely at heart, that he could not have given a stronger proof of his confidence in the earl's wisdom and fidelity, than by intrusting it to his management. The mission, however, proved unsuccessful, and the earl, having passed nine months in Germany, during which he expended not less than 40,000*l.* from his own private fortune in augmenting his already

* The rape is a division between a county and a hundred, containing commonly several of the latter, similar to the *lathes* of Kent. The term *rape* is peculiar to Sussex. Its etymology is uncertain.

splendid library and cabinet, returned to London, and was received by the king with peculiar marks of favour. A Journal, or *Relation*, as it was called, of the occurrences which took place in this voyage, was published in the succeeding year by William Crowne, gent., a book now of extreme rarity: a copy is preserved in the Royal Library at the British Museum.

In 1637 the Earl of Arundel was appointed commander-in-chief of the forces raised for the reduction of those who opposed the liturgy and hierarchy in Scotland, and afterwards first commissioner for a new treaty. He was soon after appointed steward of the royal household; and in 1640 nominated general-in-chief of the country south of Trent. The violence, however, which marked the meeting of the Long Parliament gave a sudden turn to all public affairs, and prevented the effect of both his civil and military commissions. One of its first measures was the impeachment of the Earl of Strafford, at whose trial Arundel presided as Lord High Steward, with a judgment and impartiality which was admired by all parties. It fell also to his lot to be deputed to give the royal assent to those two fatal bills which cost Charles his crown and his life, and deluged the country in blood; the bill of attainder against Strafford, and that by which it was enacted that the parliament should not be dissolved but by its own consent.

In June, 1641, he presented a petition, supported by another from several peers of great influence, beseeching the king to restore him to the dukedom; but Charles, for some unknown reasons, would favour him no further than by the grant of a patent creating him Earl of Norfolk. Disgusted by this half measure, and foreseeing the dreadful storm which was then gathering, he determined to quit his country, and the king favoured his design by appointing him to escort the queen's mother, Mary de Medici, queen dowager of France, to end there her sorrowful days in security. His family accompanied him, and he returned alone early in the following winter, and remained in England till February, when the king gave him another opportunity of leaving it, by deputing him to attend to Holland Henrietta Maria, and her daughter, the Princess Mary, who had been married in the preceding summer to William, Prince of Orange. He returned no more. After a short stay in the United Provinces, he went to Antwerp; and from thence, leaving there his countess, whom he never met again, to Spa. He wandered slowly over most parts of Italy, and at last settled at Padua, where he died October the 4th, 1646. His body was brought to England, and buried at Arundel.

The Earl of Arundel's character has been drawn at considerable length by two writers, one at least of eminence, the Earl of Clarendon and Sir Edward Walker. Both agree that he wished to be thought a scholar, but that he was more learned in men and manners than in books. Clarendon says, his expenses were without any measure, and always exceeded his revenue.

Sir Edward Walker remarks, 'He was the greatest favourer of arts, especially painting, sculpture, designs, carving, building, and the like, that this age hath produced; his collections of designs being more than of any person living, and his statues equal in number, value, and antiquity, to those in the houses of most princes; to gain which he had persons many years employed both in Italy, Greece, and so generally in any part of Europe where rarities were to be had. His paintings, likewise, were numerous, and of the most excellent masters, having more of that exquisite painter, Hans Holbein, than are in the world besides; and he had the honour to be the first person of quality that set a value on them in our nation; and so, the first person that brought in uniformity in building, and was chief commissioner to see it performed in London, which, since that time, has added exceedingly to the beauty of that city.'

Upon his return to England in 1614, the Earl of Arundel's palace in the Strand, near London, and his country retreat at Albury in Surrey, were resorted to by men of talents. He maintained Franciscus Junius and Oughtred the mathematician; he patronized Inigo Jones and Vandyke; and brought over Wenceslaus Hollar, the first engraver of merit, and encouraged him in England; and he employed Nicholas Stone, Le Scœur, and Fanelli, the first who practised their art of sculpture in this kingdom. It was from the example and recommendation of Lord Arundel, and encouraged by Villiers, who was glad to make the king a competitor in purchases, that Charles I. was originally induced to study and encourage the arts.

When Lord Arundel determined to collect a gallery of statuary, he retained two men of letters for that purpose. The well-known John Evelyn was sent to Rome, and Mr. (afterwards Sir William) Petty undertook a hazardous journey to the Greek islands and the Morea. In the islands of Paros and Delos, Petty's indefatigable researches had been rewarded with ample success, when, on his voyage to Smyrna, he was shipwrecked on the coast of Asia opposite Samos, and escaped only with his life. At Smyrna he acquired many marbles of great value, particularly the celebrated Parian Chronicle. Still the jealousy of Villiers was active in interrupting Lord Arundel's pursuit, and the delight of his retired hours. Sir Thomas Roe, then ambassador at the Porte, and consequently obedient to the minister, was directed to purchase beyond Petty's ability and to withhold from him every assistance in his diplomatic capacity which he dared not openly refuse.

Lord Arundel having assembled in his gallery his various acquisitions from Greece and Rome, adopted the following arrangement of his marbles: the statues and busts were placed in the gallery; the inscribed marbles were inserted into the wall of the garden of Arundel House; and the inferior and mutilated statues decorated the garden itself. We learn from catalogues, that the Arundelian collection when entire, contained 37 statues, 128 busts, and 250 inscribed marbles, exclusive of sarcophagi, altars, and fragments, and the inestimable gems.

Peacham, in his *Complete Gentleman* (the second edition of which was published in 1634), says, 'I cannot but with much reverence mention the every way right honourable Thomas Howard, lord high marshal, of England, as great for his noble patronage of arts and antient learning, as for his birth and place; to whose liberal charges and magnificence this angle of the world oweth the first sight of Greek and Roman statues, with whose admired presence he began to honour the gardens and galleries of Arundel House, and hath ever since continued to transplant old Greece into England.'

In 1642, when Lord Arundel left his country, Lord Orford says he transported himself and his collection to Antwerp: Dallaway says (what was no doubt the truth) that his gems, cabinet pictures, and curiosities, only were removed. He adds, 'In the general confiscation made by the parliament, the pictures and statues remaining at Arundel House were in some measure included. Many were obtained by Don Alonzo de Cardenas, the Spanish ambassador to Cromwell, and sent into Spain, with the wrecks of the royal collection.'

When Lord Arundel died, he divided his personal estate between his eldest and second surviving sons, Henry Frederick Lord Maltravers, and William, afterwards Viscount Stafford. Henry, second son of the former and sixth Duke of Norfolk, succeeded to the elder share, and in 1667, influenced by the previous recommendations of Selden as well as Evelyn, gave a part of his moiety (the inscribed marbles) to the University of Oxford; the remainder descended to his son Henry, the seventh duke, and were afterwards mostly possessed by his divorced wife.

Arundel House and gardens were converted into streets about the year 1678, when it was determined to dispose of the statues by sale. It was proposed by the agents to sell the whole collectively, but no purchaser could be found. A division was in consequence made. One portion, consisting principally of busts, was purchased by Lord Pembroke; these are now at Wilton. A second was purchased by Sir William Fermor (the father of the first Earl of Pomfret), who removed them to his seat at Easton Neston in Northamptonshire, where such as were capable of being repaired had their defects amended and supplied by one Gueff, an artist who misconceived the character and attitude of almost every statue he attempted to make perfect, and ruined the greater number of those which he was permitted to touch. Henrietta Louisa, countess dowager of Pomfret, in 1755, transferred these marbles also to the University of Oxford, where they became again united to the inscribed marbles. Mr. Theobald, in a communication to the Society of Antiquaries, made in 1758, says that many of the broken statues, which were thought not worth repairing, were begged by one Boyden Cuper, who had been a servant in the family, and removed by him to decorate a piece of garden-ground which he had taken opposite Somerset Water-gate, in the parish of Lambeth; a place of resort for citizens and others in holiday-time, and long afterwards known by the name of

Cuper's Gardens. Here they continued till about the year 1717, when Mr. John Freeman, of Fawley Court, near Henley, in Oxfordshire, and Mr. Edmund Waller, of Beaconsfield, in Buckinghamshire, happening to see them, and observing something masterly in the designs and drapery of several, and that they were fragments of very curious pieces of sculpture, agreed for the purchase of them at the price of 75*l*. One moiety of these went to Beaconsfield, and the other to Fawley Court. A few statues and broken fragments were given to a Mr. Arundel, a relation of the Duke of Norfolk, who rented a waste piece of ground on the opposite shore of the river, which afterwards became a timber-yard; one or two of these were subsequently given to the Earl of Burlington, and went to Chiswick House. A few elegant remains were carried to Mrs. Temple's seat at Moor Park, near Farnham, in Surrey. Various other fragments, which were not thought worth removing, were buried in the rubbish and foundations of the houses in the lower parts of Norfolk Street, and the other buildings on the gardens. Several of these, including a few trunks of statues, dug up at a later time, were sent down to the Duke of Norfolk's seat at Workshop Manor.

The divorced Duchess of Norfolk, by whom the busts and statues were sold, also possessed the cameos and intaglios, and bequeathed them, at her death, to her second husband, Sir John Germaine. His widow, Lady Elizabeth Germaine, who valued them at 10,000*l*., offered them, about 1755, for that price to the curators of the British Museum, who were not in a situation to bestow so large a sum upon the purchase; and finally gave them to her niece, Miss Beauclerk, upon her marriage with Lord Charles Spencer, from whom they passed to his brother the Duke of Marlborough; and are now known by the name of the Marlborough Gems.

Sir William Howard, when afterwards Lord Stafford, succeeded to a house built for his mother, the Countess of Arundel, by Nicholas Stone, in 1638. It stood near Buckingham Gate, and was called Tart Hall. The second share of Lord Arundel's curiosities was deposited there, and produced, at a sale in 1720, 885*l*. 19*s*. 11*d*., and the house was soon after levelled with the ground. This information appears upon the minutes of the Society of Antiquaries.

A single article, an ebony cabinet, painted by Polenberg and Van Bassan, was purchased by the Earl of Oxford for 310*l*.

Dr. Mead bought at this sale Lord Arundel's favourite bronze head of Homer, which is introduced into his portrait by Vandyke; at Dr. Mead's sale it was purchased for 136*l*. by Lord Exeter, who gave it to the British Museum, where it is now considered as a head of Pindar.

Lord Orford says, the coins and medals of the Arundel collection came into the possession of Thomas, Earl of Winchester, and in 1696 were sold by his executors to Mr. Thomas Hall.

The greater part of the Greek inscriptions in the Arundel Collection now at Oxford were obtained, as has been already noticed, at Smyrna, where Gassendi says the celebrated Peiresc, who was engaged in similar pursuits, had first discovered them. According to this account, one Samson, Peiresc's factor, had paid fifty crowns for the curiosities, but the Turks having seized on Samson and his collection, with a view to obtain a higher price, the Earl of Arundel commissioned Mr. Petty to redeem the whole. They arrived in England in 1627, soon after which, at the suggestion of Sir Robert Cotton, they were carefully examined by the learned Selden, in conjunction with two other eminent scholars. Selden, in 1628, published his *Marmora Arundelliana*, a thin quarto volume, in which twenty-nine Greek and ten Latin inscriptions of this collection are deciphered and illustrated. The Arundel inscriptions were, at first, let into the wall which surrounds the Sheldonian theatre, each marked with the initial of the name of Howard. They were, however, soon increased by the accession of Selden's private collection, and some other donations; so that the whole amounted to 150 inscribed marbles, including tablets, altars, pedestals, stelæ, and sepulchral monuments. An edition of the whole was now undertaken, at the desire of Dean Fell, by Mr. Humphrey Prideaux, then student of Christ Church, but afterwards dean of Norwich, which appeared under the title of *Marmora Oxoniensia, ex Arundellianis, Seldentianis, aliisque confata*; fol. 1676. They were edited with great care, and illustrated by the annotations of the editor, Selden, Lydiat, and others. This work was republished fifty-six years afterwards by Michael Maittaire, under the title of *Marmorum Arundellianorum, Seldenianorum*, *aliorumque Academiae Oxoniensis donatorum; cum*

varis Commentariis et Indice, Secunda Editio, fol. Lond. 1732; with great augmentations as to comment. An *Appendix*, consisting of three Greek inscriptions, subsequently given to the University, was published in 1733, fol. In 1763, the *Marmora Oxoniensia* were again published in a new and splendid form, under the auspices of the University, by Dr. Richard Chandler of Magdalen College; including the ancient inscriptions collected by Sir George Wheler and Messieurs Dawkins, Bouverie, and Wood, during their travels, some which Dr. Richard Rawlinson possessed, and a few others; with engravings of statues, busts, and other marbles, to the number of 167 articles, 103 of which belonged to that part of the Arundel Collection which the countess dowager of Pomfret had given to the University. The Greek inscriptions of this collection, 'Ad Chandleri exemplar editæ,' were separately published at Oxford in 1791, in a small octavo volume.

The Arundel and Pomfret marbles are at present preserved at Oxford in two rooms belonging to the public schools, beneath the picture gallery. Of the Arundel portion, that which the University places at the head of its collection is the Greek inscription known by the name of the *PARIAN CHRONICLE*,¹ so called from the supposition of its having been made in the isle of Paros about B.C. 263. Another inscription of interest is a treaty concluded between Smyrna and Magnesia, for the protection of Seleucus Callinicus, engraved on a pillar in the temple of Venus Stratoniceia, at Smyrna, about B.C. 244.

Among the more important marbles of the Pomfret donation are the colossal torso (for that portion only is antique) of a Minerva galeata, restored as a statue by Guelfi; a Venus Vestita, or Leda; Terpsichore; a young Hercules; an Athleta, which has been called Antinous; a female figure, unrestored, of early Greek work; and three statues of senators, one of which is usually considered as Cicero. This last was etched by Woolridge.

Some of the statues in this collection, which have been restored, as far as the ancient portions go, have no positive attributes of the characters of gods, heroes, &c., which Guelfi, who restored them, made them represent. (See Dugdale's *Baronage*, tom. ii. p. 277; Lodge's *Portraits of Illustrious Personages*; Selden's *Marmora Arundelliana*, and the *Marmora Oxoniensia* of Prideaux, Maittaire, and Dr. Chandler; Gassendi's *Life of Peiresc*; Gough's *British Topogr.*, vol. ii. p. 127; Lord Orford's *Anecd. of Painting*, edit. 1786, vol. ii. p. 124; and Dallaway's *Anecd. of the Arts in England*.)

ARUNDO, a genus of grasses, in which a number of useful species was once comprehended; but in consequence of the altered views of botanists regarding the limits of genera, it is now confined to the *Arundo Donax*, and the species most nearly agreeing with it. These are grasses of considerable size, sometimes acquiring a woody stem, and found only in the warmer parts of the world. Mr. Kunth defines the genus, as now limited, by the following characters:—Spikelets, each containing from two to five flowerets, which are distant from each other, arranged in two ranks, hermaphrodite, the uppermost being withered; glumes two, sharp-pointed, channelled, and keeled, nearly equal, membranous, as long as the flowerets, and at some distance from each other; paleæ two, membranous; the lowermost slit at the end, with a very short beard between the sides of the slit, covered externally, especially at the lower end and rachis, with very long silky hairs.

Arundo Donax, a native of the south of Europe, the Caucasus, Egypt, and Siberia, is one of the largest grasses that we have in cultivation; it is not unusual to see it, in rich soil, nine or ten feet high, with leaves as broad and as long as the blade of a small sword. A beautifully variegated variety is that which is usually seen in gardens.

Arundo arenaria, the sea-reed, or marrum-grass, a dwarf plant which pierces the sand-banks on the shores of the north of Europe with its tough subterranean stems, and which thus converts them into living barriers against the inroads of the ocean, differs a little from the exact character of *Arundo*, and is called by modern botanists *Ammophila arundinacea*. It is a very rigid plant, with bluish rolled-up leaves, and a stem two or three feet high, terminated by a dense tuft of flowers.

Arundo phragmites, the common reed, now forms the genus PHRAGMITES, which see.

ARUSPEX. [See HARUSPEX.]

ARVA, the most northern circle of the kingdom of Hungary, and one of the thirteen which compose the province of the Citerior-Danube. It is situated between the 49th and 50th degrees of N. latitude, and bounded on the east, north, and north-west by Galicia. It has a surface of 782 square miles; contains five market-towns and ninety-two villages, and 87,000 inhabitants, of whom 1200 are Jews. It occupies higher ground than any other circle in Hungary, of which it is one of the most unproductive portions, being intersected in all directions by offsets of the great Carpathian range, which forms its northern frontier. Of the fifty-two rivers and rivulets, which rise in this circle, the principal are the White and Black Arvas; the former flows into the latter, which has a fall of eighty-four feet in every five miles, and consequently a very rapid current. Arva produces little grain besides oats, on which the inhabitants wholly depend for their bread; but its soil is extremely favourable for the cultivation of potatoes, which are esteemed the finest flavoured in all the kingdom; and sufficient flax is grown to render linen an article of export. Its chief resource is its extensive forests, which afford large supplies of timber and fuel, and abound in bears, wolves, foxes, wild cats, &c. The whole population, excepting about 100 Jews, is of Bohemian-Slavonic, or Slowachian extraction. The capital of the district, Alsó-Kubin, is situated in the S.E. part of the circle, on the left bank of the Arva, and has 1100 inhabitants. It lies in 49° 14' N. lat., and 19° 19' E. long. It has a Catholic and a Lutheran church, as well as a synagogue.

ARVE, a river which rises in the mountains of Savoy, flows to the N.W., and falls into the Rhône just below Geneva. Its whole course is about sixty miles.

The source of the Arve is on the Col de Balme, at the N.E. extremity of the valley of Chamouni; but its waters are chiefly derived from the glaciers which cover the northern face of the chain of Mont Blanc. This circumstance causes a difference in the temperature of the river, at different distances from its source, the water growing warmer the farther it flows; and leads also to a daily alteration in the temperature at the same place. The melting of the snow goes on faster during the day, and so produces a more abundant flow of water, which is less affected by the warmth of the atmosphere than when the current is smaller, and, besides, this water traverses the lower country during the coldness of the night. These two causes produce a sensible difference in the temperature of the river near the mouth. From day-break in the month of August the waters near the mouth have been observed to grow colder till nine or ten o'clock in the morning (the difference being about 2° of Reaumur, or 4° of Fahrenheit); the alteration is effected by the arrival at this spot of the waters formed the preceding day by the melting of the snow. From nine or ten in the morning the temperature rises till ten at night, and then, after remaining stationary for a time, it falls again.

The current of the Arve is so rapid, that, for some time after it enters the Rhône, its waters do not mingle with those of that river; and at times, so great has been its violence, that it has impeded the course of the Rhône, caused the waters of the latter to flow back into the lake of Geneva, and given to the water-wheels of the mills on its banks a direction contrary to that in which they commonly move. (*Encyclopédie Méthodique*.)

ARVÍCOLA, in zoology, a genus of Rodentia. [See **CAMPAGNOL**.]

ARZAMAS, the chief town of a circle in the Russian province of Nijni or Nishni, Novgorod, lies at the confluence of the Arsha and Tesha, seventy-two miles south of N. Novgorod, the principal capital. Though the population scarcely exceeds 5000 souls, the town contains twenty churches, besides a monastery and convent. It is dirty and ill-built; the inhabitants are, however, an industrious and thriving race of men, and independently of manufacturing large quantities of soap, Russia leather, and silver and iron wares, are extensively concerned in weaving and dyeing the *krashennina*, or blue cloth, which is so great a favourite with the Russian women. They likewise export linen, sail-cloth, and other domestic products to Moscow and St. Petersburg; and the crown has a large manufactory of potashes in the town. It contains between 1400 and 1500 houses, and lies in 57° 37' N. lat., and 43° 12' E. long. Arzamas is connected with the small town of Veshna by means of a bridge across the Tesha, and their united population amounts to between 7000 and 8000.

AS, among the antient Romans, was a weight, consisting of twelve *uncia* or ounces; it was also called *libra*, *libella*, and *pondo*, or the pound. Pitiscus (*Lexicon Antiq. Rom.*) gives its etymology from the Greek *ās*, used in the Doric dialect for *εἷς*, signifying an integer or whole, one entire thing; but we can find no authority for this word *ās*. Others, as we learn from Budæus (*De Asse et partibus ejus*, lib. v. 8vo. Lugd. 1551, p. 146), have more correctly considered *As* to be equivalent to *Æs*, a piece of copper or brass. (Varro L. L. v. 36, Spengel.)

As, *Assis*, or *Assarius* (Eckhel, *Doctrina Num. Vet.* tom. v. p. 2) was likewise the name of a Roman coin of copper, or rather of mixed metal, which varied both in weight and composition at different periods of the Commonwealth; but which originally actually weighed a pound, whence it was called *As libralis*, and sometimes also *Æs grave*.

[This *As* weighs 387½ grains.]

The first coinage of this description, according to Pliny (lib. xviii. c. 3; xxxiii. c. 13), took place in the reign of Servius Tullus, which, if Sir Isaac Newton's chronology of Rome is adopted, would be about the year a.c. 460, or 587 on other authority. The first *Asses* of Tullus had the figure of a bull, ram, boar, or sow upon them.

Varro (*De Re Rustica*, lib. ii. c. 1), Pliny, and Plutarch. (*Poplicola*, edit. Bryan. tom. i. p. 226) assert that the most antient *Asses* were so marked. This, in fact, according to the two last writers, was the origin of the term *pecunia*, as used for money, a word derived from *pecus*, cattle; and also of the term *peculium*.

The next in point of antiquity to the *As* which bore the figure of an animal, is considered by Pinkerton to be the *As* which was stamped with the two-faced head of Janus on one

side, and the prow of a ship on the other. See Pinkerton's *Essay on Medals*, vol. i. p. 100, who adopts his opinion of this being the second As in point of antiquity, from a manuscript *Dissertation on the Etruscan and Roman early Coins*, written by the late Dr. Charles Combe. Ovid, in his *Fasti*, expressly alludes to the As thus marked; and it is described by Pliny (xxxiii. 3). The head of Janus was usually so accompanied, because, according to an old fable, Saturn arrived in Italy by sea.

"Multa quidem didici; sed cur navalis in aere
Altera signata est, altera forma biceps?
Noscere me duplici posces in imagine, dixit,
Ni vetus ipsa dies extenuasset opus.
Causa ratio superest: Tuscan rate venit in amnem
Ante pererrato falcifer orbe Deus."
Ov. *Fasti*, lib. i. 329—334.

[Weight

4900 grains.]

The figures on this coin will explain the expression used by the Roman boys in tossing up—*capita aut navim*, 'heads or ship.' (Macrob. *Sat.* i. 7.)

The earliest Asses were cast, probably in imitation of the Etruscan coins, which the Romans, in this instance, appear to have copied. In the British Museum there are even four Asses united together, as they were taken from the mould or matrix, in which many were cast at once. In most of the Asses preserved in our cabinets, the edge shows evidently where they were severed from each other, and where the piece at the mouth of the mould was cut off. From being cast, it will be judged that they are not very correctly sized. As the As fell in weight, the smaller divisions were not cast, but struck.

According to Pliny, the As continued of its original weight till the first Punic war, when, the treasury of the state being exhausted, it was reduced to two ounces. This, however, is improbable, and is confuted by the coins themselves; since we find Asses of all weights, from the pound downward to Pliny's two ounces. The As must, therefore, he says, have gradually diminished

to ten ounces, to eight, to six, to four; and when the size was so much reduced, still more gradual diminutions must have taken place to three, and to two ounces. One or two of the pieces which remain might even imply that the decrease was more slow, to eleven, to ten, to nine, &c., but it is to be observed that neither the As nor its parts were ever correctly adjusted as to size, so that the marks upon them only, not their comparative magnitude, distinguish the divisions.

The middle of the first Punic war being about the year of Rome 502, or B.C. 250, supposing Pliny to be correct, would be the time of the reduction of the As to two ounces.

Pliny adds, that in the second Punic war, when Q. Fabius was dictator, and the Romans were pressed by Hannibal, the As was further reduced to one ounce. This event is ascribed to the 537th year of Rome, or B.C. 215, being thirty-six years after the former change. He adds, again, that, by the Papirian law, Asses of half an ounce were coined. *Mox* is the word which Pliny uses to indicate the time of this change. A. Papirius Turdus, who was tribune B.C. 178, is suggested by Pighius (ii. 343) as possibly the author of this law; but Eckhel (*Doctr. Num. Vet.* vol. v. p. 5) considers the time uncertain. This weight of the As, however, continued till Pliny's time, and long after.

Pinkerton offers the following sketch of a plan to determine the ages of the different sorts of Asses from their weight:—The As libralis, coined by Tullus, with the figures of oxen, &c., about 167 years after Rome was built, according to Sir Isaac Newton, or B.C. 460; As libralis, with Janus and prow, 400; the As of ten ounces, 300; eight, 290; six, 280; four, 270; three, 260; two, according to Pliny, 250; one, also from Pliny, 214. But this scheme is conjectural, at least down to B.C. 250, and may be considered as intended rather for the amusement of the collector, than as instruction to the sober inquirer.

The As libralis with the head of Janus is the most common form now found of the As, previous to its being reduced to two ounces; a circumstance which shows that form to have been of long duration.

The exact period when the parts of the As were first given, in their proportions of weight and value, is not now ascertainable; but the best authors on numismatic science agree that the time was not very far removed from that of the first coinage of the As.

The coined divisions of the As were the *semis*, *quincunx*, *triens*, *quadrans* or *teruncius*, *sextans*, and *uncia*. There were other divisions of the As by weight, which it may be proper to enumerate concisely. These were the *deunx* of eleven ounces, the *dextans* of ten, the *docrans* of nine, the *bes* of eight, the *septunx* of seven, the *sestuncia* of an ounce and a half, and the *semuncia* of half an ounce. But none of these have been found in a coined form in numismatic cabinets; they are therefore universally considered to have been nominal sums. Indeed it is clear they would not be wanted, for $6+5=11$; $6+4=10$; $6+3=9$: so that these nominal sums were made up of the real coins by adding them.*

The *Semis*, *Semis*, or *Semi-As*, half the As, or six unciae, was of various types, but always marked with an S. The one here engraved represents a female head on one side, with a strigil behind, or perhaps a hook for reaping or other agricultural purposes, and a head of Pallas on the other: the S, at length, occurs on both sides. Mionnet (*De la Rareté et du Prix des Médailles Romaines*, tom. i. p. 5); and Akerman (*Descr. Cat. of Rare and unedited Roman Coins*, vol. i. pp. 6, 7) have enumerated many different varieties. See also Rasche (*Lexicon Rei Num. v. Semissis*).

The *Quincunx*, the division of five ounces or portions of the As, is of very rare occurrence. All the other portions of the As have been copied for the present work from original coins in the British Museum; but the *Quincunx*, it is believed, exists in no cabinet at present in this country.

Our present representation of it has been copied from a work entitled *De Nummis aliquot æreis uncialibus Epistola*, by the Cardinal de Zelada, 4to. Rom. 1778, a volume

* Horace (*Ars Poet.* l. 335) says, the Roman youth learn to divide the As into a hundred parts:

'Romani pueri longis rationibus Assen
Discunt in partes centum diducere.'

Possibly this passage has a reference to a centesimal division of the As, then in use.

[Weight 2191 grains.]

of extreme rarity, written for the express purpose of illustrating the passages already quoted from Pliny.

The Quincunx here given represents, on one side, a bearded head; and, on the other, a buckler, or shield, bearing five globules, on the dexter half, which indicate its value. Another type is said to represent a sort of cross on both sides; and a third kind has the head of Apollo, with the Dioscuri on horseback, on the reverse, and the word ROMA; both these also bear the globules. The last-mentioned type is preserved in the Imperial Cabinet at Vienna.

It is possible, however, that this which we have engraved may not be a genuine Roman Quincunx; other cities in Italy and Magna Græcia had their own Asses, and their divisions, marked in the same manner as those of Rome herself. (Compare Eckhel, *ut suprà* p. 11—13.) These are usually called, in contradistinction, Italian Asses. Such were those of Velitræ, Tudertia, Luceria, Populonia, Panormus, Pæstum, &c.

The Triens was the third of the As, or piece of four unciae. The type here engraved bears a dolphin on one side with the strigil above: on the other is a thunderbolt.

[Weight 1571 grains.]

Four globules, or pellets, to indicate its value, occur on both sides. Other types will be found enumerated in Mionnet (*ut suprà* pp. 7, 8); and Akerman (pp. 10, 11). Eckhel says, the head of Pallas was very frequent upon the Trientes (*Doctr. Vet. Num.* tom. v. p. 15). Pliny says (xxxiii. 3) that both the Triens and the Quadrans bore the type of a ship.

The Quadrans was the fourth of the As, or piece of three unciae. The types of this were various also (Rasche, *Lex. Rei Num.* v. Quadrans); but the value of the coin was uniformly denoted by three globules. On the Quadrans here represented, an open hand and strigil occur on both sides.

[Weight 1108 grains.]

Others have a dolphin, grains of corn, a star, heads of Hercules, Ceres, &c., on the obverse.

The *Sextans* was the sixth of the *As*, or piece of two ounces. The coin here engraved

[Weight 7.9 grains.]

bears on one side a caduceus and a single globule, on the other a cockle shell. The value is denoted on each side by two globules. On some *Sextantes* the value is designated on one side only.

The *Uncia*, twelfth of the *As*, or piece of one ounce, is marked by a single globule. The type we have selected

[Weight 186 grains.]

bears on one side an ear of barley, and on the other a frog. For the varieties of type, compare Mionnet (p. 13); Akerman (p. 17). Eckhel describes one with the head of Pallas on one side, and on the other the prow of a ship: a globule by the side of each.

As the *As* fell in weight, larger denominations of coin were struck, bearing names relative to the *As*. The *As* was latterly marked I. The *Dupondius*, or double *As*, was marked II. The *Tressis* III. The *Quadrussis* IV. There were even *Decusses*, or pieces of ten *Asses*, in copper, marked X. Olivieri mentions one in his own cabinet weighing upwards of twenty-five Roman ounces, which must have been cast when the *As* was about three ounces; for, as has been mentioned, they are far from being correctly sized. In the *Musæum Etruscum* is a *Decussis* of forty Roman ounces, cast when the *As* was four ounces. The *Denarius*, *Quinarius*, and *Sestertius* were silver coins. According to Pliny, when the *As* was reduced to one *uncia* in the second Punic war, the *Denarius*, which was originally equivalent to 10, the *Quinarius* to 5, and the *Sestertius* to 2½ *Asses*, were respectively made equivalent to 16, 8, and 4 *Asses*. On this subject see *SESTERTIUS*.

Notwithstanding that the *As* fell, it still continued to be called *libra*; and in fines of estates, and in other old customs, was, nevertheless, held to be a pound weight of copper. See Cornutus on Persius: that annotator lived in the reign of Domitian. The word *As* was also used in accounts for the whole of any heritage, &c., to late times. *Hæres ex asse* was the phrase used by the juriconsults for an heir to a whole estate. (Pitisci, *Lex. v. As.*) It is thus used by Martial (vii. 65), and elsewhere. The word *As*, indeed, with its subdivisions and multiples, was used generally as the representative of number, both in defining measures of length, the proportions of an inheritance, &c.

The *Asses* drawn for this article, from specimens in the British Museum, have been carefully weighed. A comparison of the weights will show that the parts do not correspond accurately with one another, or with the integer *As*. Our specimens may probably not all belong to one epoch, nor all to the city of Rome.

ASAM, or **TAEKHA**, a country of Asia, commonly included among the countries belonging to India beyond the Ganges, because it lies to the east of them; it should, however, rather be considered as an appendage of India on the west side of the Ganges, as the only easy access to it from Bengal is along the *Brahmapootra*. *Asam* is a valley of great extent, stretching from the meridian of 90° 30' E. to

that of 97° 30', or upwards of 440 miles, between two elevated mountain-ranges; the slopes of which, as far as they belong to this valley, advance on the north to the parallel of 28° 30' N. lat., and on the south to 25° 30'.

Along the north side of this valley, the most eastern cañon of the Himalaya mountains extends. Following the boundaries of India within the Ganges, this gigantic mountain-range lies in the direction from N. W. to S. E. or W. N. W. to E. S. E., but near 28° N. lat. 89° 30' E. long., a change takes place. At this point of change near Tassisudon, the capital of Bhotan, stands the *Chamalari*, one of the highest pinnacles of the Himalaya-range, which, being visible from a distance of 180 miles, must attain a height of at least 25,000 to 26,000 feet above the level of the sea. From the *Chamalari*, the range extends nearly due east for about 3° of long., but near the meridian of 92° 30' it begins to decline a little to the north, and thus continues up to the source of the *Brahmapootra*, where one of its pinnacles is called *Thathutheya*. This chain, which, with its numerous ridges, occupies in breadth probably 2° of lat., and perhaps in some places much more, contains a great number of peaks covered with snow, especially between the meridians of 92° and 93°, and of 94° and 95°. Toward the source of the *Brahmapootra* it seems to decrease in height, and here it is connected with that extensive mountain-region which contains the sources of all the large rivers that drain the peninsula beyond the Ganges and the southern provinces of China, and which has not yet been explored by Europeans. The mountains from which the *Brahmapootra* rises, lying between 97° and 98° E. long., may still be considered as belonging to the Himalaya range, and as forming the most eastern extremity of that extensive chain. The height of these mountains is not precisely known, but probably it is not much short of 20,000 feet; they bound the valley of *Asam* on the east. The mountain-range which extends along the southern side of the valley is much less elevated, and varies in height. Where it skirts the upper course of the *Brahmapootra* and its numerous sources, it may attain an elevation of from 13,000 to 14,000 feet, and may be compared in height, if not in extent, to the Alps of Switzerland. Farther to the south-west, where it takes the name of *Patkoi* mountains, it seems to be much lower and more accessible; and to the west of the *Patkoi* are the *Naga* mountains, still lower than the former, and extending to about 93° 30', where they are succeeded by the *Garro* hills, which rarely rise to more than 6000 feet, and terminate the valley of *Asam* on the west, opposite the mountain-ridges which surround the southern declivity of the *Chamalari*. Between these ridges and the *Garro* hills lies the wide opening by which the valley of *Asam* is connected with the plains extending along the Ganges.

Asam, with the bordering districts, including all the countries from the meridian of 90° 30' to the heads of the sacred *Brahmapootra* on the east, and from the crest of the Himalaya-range on the north, to the chain of mountains separating on the south the sources of the rivers contributing to the *Brahmapootra* from those flowing in the opposite direction, comprehends an area of about 70,000 square miles, and exceeds the reputed area of England and Wales by about 12,000 square miles. But about one-half of its surface is occupied by the offsets of the Himalaya mountains, which are inhabited by independent nations, or subject to the *Deb Raja*, or sovereign of Bhotan; the nations residing in the mountains which skirt the valley on the south are also in a state bordering on absolute independence. Only the level and in some places hilly country which extends along the banks of the *Brahmapootra*, between 90° 30' and 96° E. long., with an average breadth of from forty to sixty miles, forms what may be properly called the kingdom of *Asam*, which boundaries may comprehend an area of from 23,000 to 24,000 square miles, or less than half the surface of England.

The *Brahmapootra*, whose sources however have not yet been visited by any European, rises in the Himalaya range, or some mountains connected with it, between the parallels of 28° and 29°, and the meridians of 97° and 98°. The upper part of its course is first from N. E. to S. W., and then from S. E. to N. W., between high mountains, in a narrow valley, till changing its direction to nearly due south it passes the sacred pool called the *Brahmakoon*, and soon afterwards leaves the mountain-region and enters the plains of *Asam*, between 96° and 97° E. long. The general direction of its course in the plain is nearly due west up to the

mouth of the Dihong, which joins it from the north between 95° and 96° E long.; and from that point till it leaves Asam at Goyalpara (Goalpara) the river is called Lohit, and runs for about 120 miles nearly due south-west, and afterwards to the south of west. Before it takes the latter direction it divides into two branches, which afterwards by re-uniting enclose an island called Majholi, which is upwards of twenty miles in length, with an average breadth of from four to five. After its branches have re-united, the river, running W. by S. for upwards of eighty miles, divides again, and here its branches enclose a much larger island, extending, according to report, five days' journey in length and one in breadth, which, however, seems not to be distinguished by any peculiar name, and terminates at no great distance to the east of Gowahat (Gowhatti, or Gohati), about 80 miles from the boundary of Bengal. Having entered Bengal at Goyalpara, it bears the name of Brahmapootra to its junction with the eastern branch of the Ganges, after which the united river is called Megna. In the valley of Asam it may run upwards of five hundred miles, and is navigable for vessels of considerable burden, or for large boats, as far as Sonpura, twelve miles above Sadiya, or about the 96th meridian.

The tributary rivers which descend from the mountains on the north and south sides of the valley are only navigable as far as their courses lie in the plains, and only in the rainy season, and for a short time afterwards. None of those which join the Brahmapootra from the south have a long course; the most considerable, as the Noa (Little) Dihing, Buri (Great) Dihing, and the Deyong run little more than a hundred or a hundred and twenty miles. But many of those which issue from the Himalaya range are very considerable and bring down a great volume of water, especially the Dihong, which joins the Brahmapootra between 95° and 96° of long., and is not without reason supposed to be the same river which in the table-land of Tibet is called the Sampoo or Yarou-Zangbo-tsui, and not a remote branch of the Irrawaddy, as we see it represented in some maps. [See BRAHMAPOOTRA.] Farther to the west it is joined by another large river, the Suban Shiri, whose sources, however, like those of the Manas or Bonash, which falls into it near Goyalpara, are unknown to Europeans.

Asam, though not situated within the tropics, partakes of the tropical climate, the seasons being distinguished by the abundance of rain, or the continuance of dry weather. Three or four months of the year, or from the 15th of October to the month of February, may be calculated on as clear and dry, the sky during all this period being free from clouds; but the remainder of the year is perfectly uncertain. The heavy rains set in about the 15th of June, and continue to the 15th of September, when nearly the whole extent of the valley is inundated. These inundations are chiefly caused by the quantity of water brought down by the rivers from the northern mountains, which is so immense as not only to fill the wide bed of the Brahmapootra, but even the channels of the southern rivers up to the place where they issue from the mountains; these latter rivers themselves contribute little to the inundation. When the inundations begin to decrease, the climate is for some time unhealthy, especially for foreigners, but otherwise it seems not to be worse than the climate of Bengal. At the time of the inundation the inhabited places would be isolated, if they were not connected by causeways, eight feet high and about eighteen feet broad. These causeways are almost the only lasting monuments of human industry in this country, but they have in the late unsettled times partly gone to decay.

The soil all over the valley, except some hilly districts, is alluvial, and the result of the annual inundations: it is perhaps not exceeded in fertility by that of any other country, and would doubtless maintain twenty and perhaps a hundred times the number of its present inhabitants, were it not that the comparatively narrow breadth of the valley and its position between two very extensive mountain ranges, inhabited by warlike and barbarous mountaineers, expose its inhabitants to the continual incursions of their neighbours. To some of them, as to the Abors, the inhabitants of the plains are obliged to pay an annual tribute, and persons are sent down every season to collect it. In other places, especially along the upper Brahmapootra, the mountaineers, as the Miris and the Khamtis, have driven out the Asamese, and settled in the plains. To these causes it must be attributed, that only a very small portion of this

fine valley, certainly not more than a hundredth part, is under cultivation. But since 1826 the English have undertaken to protect the inhabitants of the lowlands; and as they have shown the mountaineers their superiority in arms in different encounters, a speedy change may soon be expected.

The rural economy of Asam resembles that of Bengal, three-fourths of the cultivated land being appropriated to the production of rice, which yields annually two abundant crops; but they are not always sufficient to save the inhabitants from famine. A kind of mustard-seed is extensively cultivated, and chiefly used for making oil; the quantity of sesamum raised is inconsiderable. Wheat, barley, and millet, though they succeed well in the more elevated and drier districts, are not much used. The *Cytisus cajan* was formerly only cultivated for the rearing of the lac insect, but now it is grown for its pulse, other plants being employed as food for the insect. The most common pulse is the hairy-podded kidney-bean. Black pepper is indigenous, and large quantities of it are gathered without cultivation. Other vegetables, such as long chilies, are raised, with choyies, ginger, turmeric, capsicums, onions, and garlic. Cocoa-nuts are rare, and no palm-wine is made: but oranges abound, and are indigenous in the neighbourhood of Sadiya; the fruit is acid, but not disagreeable, and the pulp of a pale yellow, like that of the lime. Cotton is only cultivated by the mountaineers in the southern hills, but silk is produced in great quantities, and seems to succeed exceedingly well. Four kinds of silk-worms are raised, of which that which feeds on mulberry-leaves is not very common. One kind, called *muga*, which is more abundant, lives on a species of *laurus* in the open air, and the cocoons are gathered twice in each year, once at the beginning of the dry season of a red, and again towards the end of the spring of a white colour. The white is reckoned the best, and entirely used by the rich people of the country. The worms which give the silk called *medungori* are reared on a tree, the botanical character of which has not yet been determined, but which is planted for that purpose. The worst kind of silk, called *erendi*, is reared on the *ricinus* in large quantities, especially about Rungpoo.

The botanical wealth of the valley, and that of the contiguous hill, has not been examined by any botanist. The tea-tree is said to grow in the vicinity of Sadiya, and the gum-copal tree in the Naga hills. The caoutchouc tree is indigenous throughout the country. The sugar-cane succeeds well, but is only cultivated for eating. Betel-leaf, areca-nut, opium, and tobacco, are plentifully produced in every district, and even in the mountains, which in some parts are covered with timber trees.

Oxen and buffaloes are reared, but only for the plough, as the inhabitants do not eat beef. Horses are not numerous, and asses are not reared at all, which is also the case in some other parts of the peninsula beyond the Ganges. The sheep are rare, and covered with hair instead of wool; goats are not numerous, but poultry abounds in every district.

The buffalo is found also in a wild state. The elephant and bear are only met with in the forests and mountains of the eastern and southern districts, but deer, tigers, and leopards abound in the numerous tree jungles. In some parts the small black long-armed apes are frequent, and in some rivers otters and river-turtle of a very large size. Fish and wild ducks are every where plentiful. From the mountains wax is brought down in considerable quantity.

Little is known of the metallic wealth of this country. Gold is found in and collected from the rivers flowing from the north, and a gold-mine is said to exist at the junction of the Deyong with the Brahmapootra, about thirty-two miles in a direct line east from Gowahat. Iron mines are found in the Naga mountains, and coal has been discovered in some of the lower hills; among which also salt-springs are found.

Garnets, seven-tenths of an inch in diameter, are found in syenitic granite rock, in the mountains near the sources of the Brahmapootra.

Asam is divided into three provinces, Camroop, Asam Proper, and Sadiya, of which the first occupies the western districts, from the boundary of Bengal to the 93d meridian; Asam Proper is in the middle, and extends to the junction of the Brahmapootra with the Dihong; and Sadiya lies to the east of it, and stretches to the heads of the sacred river. Asam Proper contains the best-cultivated districts, and the

few places which deserve to be called towns; Jorhath, the residence of the sovereign or raja, and Rungpoor, the most industrious place, the ancient capital Gerghong being almost entirely abandoned; but these places exhibit only a collection of huts, and contain no shops, the inhabitants of the country supplying all their necessities by domestic industry.

The Asamese, or inhabitants of the plains, are doubtless of Hindu extraction, which appears from their physical constitution, their language, and their religion. The language differs so little from the Bengalee, that the latter has lately been adopted as the common medium of instruction in their schools. Their religion is Brahmanism, but many of the inhabitants belong to impure tribes. In the parts adjacent to Bengal, there are many Mohammedans, but their religion has degenerated into a heathen superstition.

The better classes dress pretty well: the women are always clothed in silk, and even three-fourths of the male population, especially of the middling classes. Cotton, not being grown in the country, is only used by the rich people, and mostly imported from Dacca, in Bengal. Their habitations are miserable constructions, consisting only of thatched huts, with walls of bamboo-mats, and supported by posts of saul (the *Shorea robusta*, a valuable timber tree), with arched roofs and mud floors. Each apartment forms a separate hut. In such huts are lodged the king and the nobility, as well as the poorest man in the country.

Though they have some skill in spinning and weaving silk cloth, even in this respect they have still much to learn from their neighbours in Bengal; and it seems that they know how to profit by the opportunity now offered to them, some spinning establishments having been lately erected. They have also made some progress in working iron, which is brought from the southern mountains; and in making ornaments of ivory.

The sovereign is considered as the only proprietor of the land, and the cultivators, who are called *pykes*, have only a temporary interest. For the privilege of cultivating the soil and enjoying its fruits, they are bound to work four months of the year for the king, or to pay him a compensation. It would seem that this constitutes the only tax they have to pay.

The mountaineers, who inhabit the ranges to the north, east and south of the valley, are mostly Bhuddists, and some of the valleys occupied by them are better cultivated than the plain, chiefly perhaps from not being exposed to hostile invasions. They do not raise much rice, but great quantities of Indian corn, and a small grain named *bubessia*. They cultivate also yams, mustard, pepper, cotton, and tobacco, and rear a great number of animals, especially of the cow kind; for besides the cattle, which are proper to their hills, they keep the small oxen of Asam Proper, and the chowry-tailed cattle of Tibet. Swine, as well as dogs, are numerous among them, and the latter used as food. Their habitations are commonly much larger and more convenient than those of the inhabitants of the plains. These mountaineers speak languages altogether differing from that of the Asamese, and which do not appear to have much affinity to one another.

The Miris occupy the hilly country on both sides of the Suban Shiri, and partly also the plain; the valleys in the Himalaya range, lying farther west, are subject to the Deb-Raja, or sovereign of Bhotan, and on the east of the Miris the mountains on both sides of the Dihong are inhabited by the Abors, whose neighbours on the east are the Mishmis, up to the source of the Brahmapootra. The heights skirting the upper course of this river on the south are occupied by the numerous and powerful tribe of the Sinh-fos; and the adjacent low country is inhabited by the Khamtis, up to Sadiya. The small tribes of the Mowamarias, or Moras, divide the Sinh-fos from the Nagas, who occupy by far the greatest extent of the southern range, and extend to the Cassya and Garrows, on the boundary of Bengal.

We shall not enter into a detail of the manners and customs of these savage nations, but we cannot help noticing the very singular coincidence of the political institutions of the Abors with those of the inhabitants of the Alps in the country of the Grisons. Every village forms a democratical republic by itself, and is governed by the laws enacted by all the inhabitants in a formal meeting. This meeting is called *Raj*, which evidently signifies the *sovereignty*. It is held in the morning, and every male inhabitant has an equal

vote. It appears, though it is not acknowledged by them, that among the Abors, as among the Grisons, some few, either by their superior wealth, hereditary reputation, or real ability, exert a very strong influence over the rest, and can readily sway them to any measure they like. The Raj, however, is extremely jealous, and very vigilant in preserving their democratical rights. Hence they have laws which make the public burdens fall equally on all. In the middle of the village is the *morang*, a large building, which serves as a hall of audience and debate, as a place of reception for strangers, and as a dwelling for the bachelors of the village generally, who by their laws are not entitled to the aid of the community for the construction of a separate house. Their orators seem to have studied rhetoric and to have considered its effects on the minds of their countrymen; they speak in a remarkably emphatic style, dwelling upon each word and syllable. They are wonderfully fond of holding their palavers, at which they are heard with the utmost patience and without any interruption, and in this particular they are certainly much superior to many more civilized nations. If in an affair of importance the assistance of their neighbours is required, they send ambassadors to the other republics, who are charged to make proposals or to accept what has been proposed by another community.

Before Asam was visited by Europeans, the number of its inhabitants was thought to amount to a million or even a million and a half; but now that most of its districts have been surveyed, it is supposed that the population is not much more than 150,000 or 200,000. But this estimate seems rather too low, when we consider the great extent of the country, though it is true that very large tracts are covered with jungle, and show no signs of cultivation nor any traces of inhabitants.

The antient history of Asam is entirely fabulous. It seems for a long time to have been under the sway of sovereigns of Hindu origin, and to have undergone many revolutions. In the seventeenth century the Mogul emperors of Hindustan sent a numerous army to subject Asam: the conquest succeeded almost without any resistance on the part of the inhabitants and their sovereign, and was effected in the course of one dry season; but no sooner had the rains set in than the whole army was destroyed by disease, and by the Asamese, who returned from the mountain fastnesses, to which, at the time of the invasion, they had retired for security. Very few of this Indian army regained Bengal. In modern times the continual discords and intrigues in the royal family brought it under the dominion of the Burmese, who are said to have treated the people and the sovereign with much severity. The Burmese were expelled almost without a struggle by the English in 1824, and obliged by the peace of 1826 to leave this country and its sovereign under the protection of the East India Company.

The commerce of Asam is of very little importance. The mountains which surround it on all sides, except on the west, are of such a description as to preclude almost entirely the possibility of conveying commodities to the contiguous countries. The attempts made by the English to penetrate the Himalaya range and to enter Tibet from this side have hitherto not succeeded, nor have they yet discovered a route leading to that country, though it is certain that such a road must exist, as the mountaineers, especially the Abors, are dressed in cloths of Tibet woollens, and possess other articles of the manufactures of that country. It is, however, known that to the north of the Brahmakoond there is a pass over the mountains which are inhabited by the Mishmis, and this pass conducts to a country inhabited by a nation called the Lamas. But it is a journey of twenty days from the river, through an extremely mountainous region, to the country of the Lamas. The Mishmis seem to be an enterprising and commercial tribe. They cross this range, and likewise the mountains which surround the sources of the Brahmapootra, and bring articles of Tibet manufacture to the Khamtis inhabiting the plains on the upper course of the Irawaddy. Two mountain passes lead from the valley of the Brahmapootra eastward to the Irawaddy; but they pass through a sterile mountain region, in which, for ten days' journey, no habitation is seen. From the town of Rungpoor a road leads over the Naga mountains and descends into the valley of the Ky-an-du-ayn river in the Burmese empire, and this road is even passable for beasts of burden; but since Asam has been withdrawn

from the dominion of the court of Ava, all intercourse with that country seems to have ceased. Two passes across the Garrow Hills connect Camrup with Silhit, a province of Bengal, and one of these passes near the sanatorium (or invalid station) of Churra Punje. The commercial intercourse of Asam at present seems to be almost entirely confined to that with Bengal, which is indeed of very little importance. Asam exports the coarsest kinds of silk, but not in great quantity, and receives in return salt and cotton goods made at Dacca; having few things to give in exchange, the people of Asam pay for some of these imported commodities in gold. (Buchanan, Bedford, Neufville, and Wilcox, in the *Asiatic Researches*; *Asiatic Journal*; *Map of India East of the Ganges* by Berghaus.)

ASAPH, ST., a city in Wales, near the western extremity of the county of Flint, on the road from Holyhead to Chester. It is twenty-eight miles and a half from Chester, and 217 from London.

St. Asaph stands on the slope of a small hill between the rivers Clwyd and Elwy, of which the former is to the east of the city and at some distance; the latter (a turbulent stream, which falls into the Clwyd a little farther down) is close to the western side of the city, at the bottom of the grounds of the bishop's palace. From its situation on the banks of this stream, St. Asaph had formerly the title of Llan Elwy, or the *town or city of Elwy*. The main street of the city, which is built with tolerable uniformity, runs up the slope of the hill from the bridge over the Elwy (which has five arches) to the cathedral, which is on the summit of the hill. There has been some increase of building on the west side of the town on the Holyhead road, and on the north side, or rather north-west, where a road runs parallel to the course of the Elwy towards Rhuddlan. The place is, however, altogether very small; the whole parish, which is extensive, having in 1831 only 3144 inhabitants. There is not any particular branch of trade or manufacture established here; the town contains very few good houses; and, excepting the cathedral, there is little in it to claim attention. There is a parish church at the bottom of the hill near the bridge; and the bishop has a palace, large and convenient though not magnificent, rebuilt by Bishop Bagot, who held the see about the close of the last or beginning of the present century, and enlarged by the present bishop, Carey. The deanery is on the farther side of the Elwy, and nearly opposite the bridge. It is quite new, having been rebuilt by the present dean.

The cathedral is small, but plain and neat. The original structure was of wood, but was replaced by a building of stone. This having been, in 1282, burnt by the English in their wars with the Welch, an attempt was made to transfer the see from St. Asaph, then an open and defenceless village, to Rhyddlan or Rhuddlan, which was fortified. From some cause or other, not well ascertained, the attempt failed, and in 1284 the cathedral was rebuilt; and this may be considered as the present edifice, for the walls have remained ever since. In 1402 the cathedral was burnt by Owen Glyndwfr, and only the walls left standing. After having lain nearly eighty years in ruins, it was restored by Bishop Redman, who repaired the walls and put on a new roof. Further improvements or repairs were made by Bishop Owens, who filled the see in the time of Charles I.; but the predominance of the puritan party put a stop to them, and subjected the cathedral and its furniture to some injury. Further repairs were made by Bishops Glemham and Barrow, who successively filled the see after the Restoration (especially by the latter); and also by Bishops Fleetwood (from 1708 to 1714) and Wynne (1714 to 1723). The choir was rebuilt in the time of Bishop Shipley (who was bishop from 1769 to 1787), out of a fund vested in the dean and chapter for the purpose.

This edifice stands on the south side of the main street of the city, in a churchyard of sufficient size to afford a good view of each side. It is a plain cross church, with a square embattled tower in the centre, having a square turret staircase at the north-eastern angle. The dimensions are as follows:—

Length of the church from E. to W.	178 ft. in.
— from the west door to the choir	84
— of the choir	93
— of the cross aisles or transepts N. to S.	108
Breadth of the nave and side aisles	68
Height of the nave from the pavement to the ceiling	60

These dimensions differ from those given in Brown Willis's *Survey of St. Asaph*, and in the *Beauties of England and Wales*, especially in the length assigned to the choir, which has been very much enlarged, while the length from the west door to the choir has been diminished by the alteration in an equal degree. The alteration took place in the spring of the year 1833; and the space taken into the choir is that between the arches that support the square embattled tower, 34 feet 8 inches in length, by 29 feet 9 inches in width. A new organ was put up at the same time. The choir and transepts have no side aisles.

The nave and transepts are of the age when the decorated style of English architecture prevailed, which was, according to Rickman (*Essay on Gothic Architecture*), during the reigns of Edward II. and III. A.D. 1307 to 1377; but this style must have been in use before, as we have seen that the walls were raised in 1284. The architecture of these parts contains some singularities and beauties, among which may be reckoned the west window, and the painted window at the east end of the choir, from a picture by Albano, representing our Saviour about twelve years old, surrounded by angels, and the various instruments of torture, such as the cross, the nails, and crown of thorns. The belfry windows appear to have been altered. The piers and arches of the nave, as also the western door, have plain but bold mouldings. The clerestory windows of this part are small square apertures with portions of tracery, which appears to be ancient. The windows of the transepts, though not remarkable for their tracery, are of decorated character. The choir, which, as noticed above, was nearly rebuilt in the time of Bishop Shipley, is an attempted imitation of ancient work, but has no real resemblance to any style, though apparently intended to imitate the perpendicular. The tower and some other parts have partially undergone a similar renewal to that of the choir. A portion of the transepts is cut off to form the chapter-house and vestry, and there are neither additional buildings, nor, according to Rickman, any trace of any; but the older plans and drawings of the cathedral, which we have seen, represent the chapter-house as built out from the north side of the choir, and having a door opening into it from the choir. The buttresses about the church are few. The tower is ninety-three feet high, and commands a fine view of the rich and extensive vale of Clwyd. It has only one bell in it, though there are frames for eight. It is built of squared stone, of which some is red, intermixed with a harder sort of a brown or grey colour. The stone used in the choir, and in most of the windows of the church, is soft, red, and mouldering. None of the monuments call for notice except one, supposed to be that of Bishop David Owen (ob. 1512), which was moved from the choir on the repair of the latter; another, lately erected by subscription to the memory of Dean Shipley; and a third, a heavy pile, erected to the memory of Bishop Luxmoore.

The see of St. Asaph is said to have been founded by Kentigern, or, as the Scottish historians call him, St. Mungo, who was bishop of Glasgow. Having been driven from his see about the middle of the sixth century, he took refuge in North Wales, established a monastery, and erected a bishopric near the river Elwy. Upon his recall to Glasgow, he left this charge to his disciple Asaph or Hasaph, a native of Wales, from whom the cathedral and the diocese got their designation. In the wars between the English and Welch, in which the frontier situation of St. Asaph was very disadvantageous to it, the early records of the see perished, and there is a long hiatus in the list of bishops. In modern times the bishopric has been held by men of eminence for talent, piety, and learning. Among these may be mentioned Bishop Lloyd, one of the seven committed to the Tower by James II., Bishops Beveridge, Tanner, Shipley, and Horsley.

The bishop's revenue was valued in 26 Hen. VIII. at 202*l.* 10*s.* 6*d.* in the whole, and 187*l.* 11*s.* 6*d.* clear. We have no data for ascertaining its present value.

The diocese comprehends Flintshire, Denbighshire, and Montgomeryshire (with the exception of a few parishes), and parts of Merionethshire and Shropshire. There were in it, at the beginning of the present century, 130 benefices, viz.

55 rectories,
48 vicarages,
13 parochial curacies,
14 chapels,

all of which, except seven, are, together with the deanery, in the gift of the bishop. It is divided into eight deaneries, viz. Rhos, Tegengle, Bromfield and Yale, Marchia, Penllyn and Idernion, Pool, Caedewen, and Cyfeiliog and Mowddy.

The cathedral establishment includes, besides the bishop, a dean (who has a house west of the town beyond the river Elwy), six prebendaries, seven canons curial, four vicars choral, an organist, six lay clerks, and six choristers. The archdeaconry has been held *in commendam* with the bishoprick ever since 1573, for the better maintenance of the latter.

The parish church is a small building, of two aisles parallel to each other, and has no steeple.

St. Asaph has a weekly market, viz. on Friday; and four fairs in the year, on Tuesday in Easter week, July 15, October 16, and December 26. The petty sessions for the division of Rhuddlan are held here. There is an almshouse for eight poor widows, founded by Bishop Barrow (uncle to the celebrated Dr. Isaac Barrow), a prelate of eminent benevolence and goodness; and an endowed school for boys.

The parish is large, and contains many townships. It extends into Denbighshire, and is five miles from east to west, and four from north to south. By the late reform bill St. Asaph has been added as a contributory borough to Flint. The boundary of the borough comprehends a considerable portion of land beyond the town, but is not by any means so extensive as the parish. The number of houses valued at ten pounds and upwards yearly value, within the limits, is ninety-three.

The country around the city is very beautiful. Within the parish is Capel Ffynnon Vair (Chapel of our Lady's Well), a picturesque ruin, near a spring, from which it takes its name, once much resorted to by devotees.

From the name of the eminence on which the city stands, *Bryn Paulin*, it has been conjectured that the Roman general Suetonius Paulinus encamped here on his way to or from Anglesey. [See *ANGLESEY*.] (Browne Willis's *Survey of St. Asaph*; Pennant's *Tour in Wales*; Bingley's *Tour round North Wales*; Rickman's *Essay on Gothic Architecture*, &c.)

ASA'RIMUM (in botany), a genus of plants, belonging to the family of the *Aristoloches*, distinguished by having the calyx bell-shaped and three-lobed; the stamens placed upon the ovary, the anthers adnate to the middle of the filaments, the style short, stigma stellate, and six-lobed; the fruit capsular, and six-celled. The *A. europæum* is known by having two obtuse kidney-shaped leaves on each stem. It is a perennial plant, found in woods in different parts of Britain. The root, which is employed under the name of *asarabacca*, contains a camphor-like principle, and a bitter principle, called *asarin*, which is combined with gallic acid. To these it is indebted for its action on the human system. Taken into the stomach in a state of very fine powder, it causes vomiting; in coarser powder, it generally purges. It was formerly employed as an emetic instead of *ipecacuanha*; but, from the violence of its effects, it is now properly laid aside in medical practice: it is still, however, used in veterinary medicine, to vomit and purge. The fine powder applied to the nostrils causes sneezing, and a flow of mucus from the membrane which lines those parts. It is therefore extensively employed as an errhine, and is the basis, or chief ingredient, of many cephalic snuffs. It is used in chronic inflammations and some other diseases of the eye, and in headaches. Where these last arise from disorders of the digestive function, such means can be of no avail: where they are connected with congestion or fulness of the vessels of the head, the increased discharge from the Schneiderian membrane may give temporary relief in the same way as a few drops of blood, flowing spontaneously from the nose, or obtained by puncturing the membrane. When taken into the stomach in considerable quantity, it acts as a poison.

ASBESTUS must be considered, in mineralogy, rather as a term implying a peculiar form sometimes assumed by several minerals, than as a name denoting a particular species; it is in fact applied to varieties of the amphibolic minerals, such as actinolite, tremolite, &c., which occur in long capillary crystals, placed side by side in parallel position, and thus giving rise to a fibrous mass. As might be expected, the above conditions are fulfilled in various degrees, and there are accordingly various kinds of asbestos. Those varieties, the fibres of which are very delicate and regularly arranged, are called *amianthus*, a Greek term signifying *unpol-*

luted, unstained: the individual crystals are here readily separated from each other, are very flexible, and elastic, and have a white or greenish colour with a fine silky lustre. Though a single fibre is readily fused into a white enamel, in mass it is capable of resisting the ordinary flame, so that when woven it produces a fire-proof cloth, and hence the name from the Greek *ἀσβεστός*, in the sense of *indestructible*. The most beautiful specimens have been found in the Tarentaise in Savoy; but Corsica must be considered as its principal locality, from its great abundance. It is also found in Cornwall at St. Neverne: likewise in several parts of Scotland. It occurs also in the United States of America, where it is sometimes used as a wick for an oil lamp.

Those varieties in which the crystals are coarser, with scarcely any flexibility, are called common asbestos. It is generally of a dull green, and sometimes a pearly lustre, and readily fuses before the blow-pipe flame. It occurs more frequently than amianthus, and is usually found in veins traversing serpentine.

There are three other varieties, known by the names of mountain feather, mountain wood, and mountain cork, which differ from the common asbestos by the fibres interlacing each other. The two first have received their name from their appearance; the third from its extreme lightness, and from its swimming in water. They have been found in Scotland.

ASCALABOTES, in zoology, a genus of reptiles. [See *GECKO*.]

ASCALON (*Ἀσκαλὼν*), a town of Palestine, on the shore of the Mediterranean, about twelve miles north of Gaza: it was one of the 'fenced cities' of the Philistines, but shortly after the death of Joshua it fell into the hands of the tribe of Judah; it was afterwards successively under the Assyrians, Persians, Greeks, and Romans.

[Copper Coin in the Brit. Mus.]

There was a celebrated temple of the Heavenly Venus (*Θρηναῖν Ἀφροδίτην*) at Ascalon, which Herodotus (I. 105) mentions as having been plundered by the Scythians B.C. 630. Forty rose-granite columns, belonging to an ancient temple, in the Greek style, are still standing, with capitals and friezes of the most beautiful marble. This temple is probably the representative of the old Syrian edifice. There are also the remains of a Roman amphitheatre at Ascalon. Antiochus, the academician and the master of Cicero, was a native of this place. In the early ages of Christianity, Ascalon became an episcopal see; and it was one of the strong holds of the Crusaders during the Holy War. On the plains of Ascalon a battle was fought between the Crusaders under Godfrey de Bouillon and the Saracens under the Vizier of Egypt. The cuirasses, casques, and swords of the knights are still found among the ruins.

The town stands on an extensive semicircular hill, the declivity of which is nearly insensible towards the land, but of considerable abruptness on the sea-coast. The walls of the town, with their towers and battlements, are still standing, and among the ruins are vast Gothic churches, a palace, and a chapel dedicated to the Virgin, blended with traces of more ancient date. On the roof of the chapel are these words still legible: 'Stella matutina, advocata navigantium, ora pro nobis'; but the place is entirely deserted by every living being, save jackalls and antelopes. The Arabs call it *Djaurah*, and believe it to be the residence of evil spirits; they assert that strange noises of battle are nightly heard amid the ruins. Excavations have been made by Lady Esther Stanhope, who, however, abandoned them on account of the expense.

At a short distance to the northward is a small modern village called Scalona, evidently a corruption of the ancient name; and here is the port for the small vessels that trade along the coast.

Ascalon lies in 31° 35' N. lat., 34° 47' E. long. (William of Tyre: Count Forbin's *Voyage au Levant*.)

ASCA'RIDES. [See *INTESTINA*.]

ASCENDANT. [See *ASTROLOGY*.]

ASCENSION, RIGHT and OBLIQUE, and **ASCEN**

SIONAL DIFFERENCE, astronomical terms, of which the two latter are nearly out of use, while the term *right ascension* is preserved, in a somewhat different signification from its original meaning, to denote one of the angles by means of which the position of a star is ascertained.

If we suppose a person at the equator, looking directly towards the east, and raising his arms on each side till they are horizontal, his fingers will then point towards the two poles (which, at the equator, are in the horizon), and a line drawn through his arms will be a part of the axis on which the heavens appear to turn. Every star will rise vertically, that is, if the diurnal motion were quick enough to justify the phrase, would appear to shoot above the horizon directly upwards. The great circle of the heavens which his eye traces out as he raises his head without turning to right or left, is the equator, and the same point of the equator rises every day with the same star. If there be a remarkable star in the equator, from the rising of which the spectator chooses to begin his *astronomical* day, he will know the time of rising of any star as soon as he knows how far the point of the equator which rises with it is from the star at whose rising he begins to count the twenty-four hours.

Suppose, for example, it is 60° ; then, since the whole 360° of the equator rise in twenty-four hours, 60 of them will rise in four hours, or the star will rise at four o'clock of his astronomical day.

Let O be the spectator, N and S the north and south poles, E the east point of the horizon, EZ part of the equator, and A the star. Through the north and south poles and the star draw a circle N A S, cutting the equator in T. Then if Q be the star at the rising of which the astronomical day begins, the number of degrees in QT is the right ascension of the star.

Instead of the horizon NES, any other circle may be substituted which passes through N and S; for example, the meridian NZS. For, draw any circle through N and S, then the diurnal motion will bring A and T upon that circle at the same moment, and Q and T will pass that circle one after the other with the same interval as occurred between their times of passing E, or their times of rising.

Substituting the meridian (which always passes through the poles) for the horizon, this method of reckoning may be used in any latitude. For the same point of the equator always comes upon every meridian with the same star; but, instead of using a star in the equator as the point from which to reckon, the vernal equinox is preferred, or the point at which the sun's path crosses the equator when he ascends into the northern hemisphere. The distance of the point of the equator just mentioned from the vernal equinox, measured upon the equator according to the order of the signs, in degrees, minutes, and seconds, is the right ascension *in space* [see **ANGLE**] of the star. The same turned into time [see **ANGLE**] is the right ascension *in time*, and indicates the interval which elapses between the times when the equinox and star severally come on the meridian. The whole time which a star takes to complete its diurnal revolution, or the *sidereal* day [see **DAY**], it must be recollected, is not the common solar day, but about four minutes shorter.

The old term *oblique ascension* is an extension of the *right ascension*, as derived from our first illustration, to the *oblique* sphere, in which one pole is above the horizon, and the other below. Let P be the north pole, Z the zenith, EQ the equator, Q the vernal equinox. Let A be a star at its rising, and T the point of the equator which comes to the meridian with it (and would rise with it to a person at the equator). In the latitude represented in the figure, E is the point of the equator which rises with it, and QE is what used to be called the *oblique ascension*: the right ascension is QT; and TE, the difference between the oblique and the right ascension, was called the *ascensional difference*,

but was principally applied to the sun, because when turned into time, it shows the time before or after six o'clock, of sunrise. The ascensional difference is found by the following formula.

$\text{Sin. asc. diff.} = \tan. \text{latitude} \times \tan. \text{star's declination.}$
When the star's declination is north, *from* the right ascension *take* the ascensional difference; when south, *to* the right ascension *add* the ascensional difference: the result is the oblique ascension.

For the method of determining the right ascensions of the stars, see **TRANSIT INSTRUMENT**, **EQUINOX**.

ASCENSION DAY, a festival of the Christian church, on which the ascension of Our Lord is believed by some authors to have been celebrated from the very first century of the Christian era. It has been held for ages on the Thursday next but one preceding Whit-sunday. (See Brady's *Clavis Calendaria*, vol. i. p. 357.) It is also called *Holy Thursday*, a name by which it has been known in this country at least as far back as the time of King Alfred, in whose laws it occurs, On þone halgan þunney dæg (or the holy Thursday).

It was on this day, or on one of the three days which immediately preceded it, and which were considered as days of preparation for it, that in antient times the minister of every parish, accompanied by his churchwardens and parishioners, was accustomed to go round the limits of his district, to deprecate the vengeance of God, to beg a blessing on the fruits of the field, and to preserve the rights and boundaries of the parish. The week in which Ascension Day occurs is usually called Rogation Week, from the Rogations or Litanies which were used in the perambulations. The Anglo-Saxons called the days of this week *gang dæg* (walking days), from the perambulations which were made. In London such parochial processions are still observed on Ascension Day itself.

Pennant, in his *Tour from Chester to London*, p. 30, tells us that on Ascension Day the old inhabitants of Nantwich piously sang a hymn of thanksgiving for the blessing of the Brine. A very antient pit, called the Old Brine, was also held in great veneration, and, till within these few years, was annually, on that festival, bedecked with boughs, flowers, and garlands, and was encircled by a jovial band of young people, celebrating the day with song and dance.

It was upon Ascension Day, too, that the Doge or chief magistrate of Venice was formerly accustomed, by throwing a gold ring into its bosom, annually to espouse the Adriatic Sea; using the words 'Desponsamus te, Mare, in signum perpetui domini.'—We espouse thee, O Sea, in testimony of our perpetual dominion over thee.—This practice, which is said to have originated in a grant from Pope Alexander III. to the Venetians, of power over the Adriatic Ocean as a man has power over his wife, ceased only with the government of the Doges.

ASCENSION ISLAND lies in the south Atlantic, between Africa and Brazil; the nearest land is the island of St. Matthew, 520 miles to the N.E. It is 685 miles to the N.W. of St. Helena, and 1450 from the coast of Africa. Its form is an oval, seven miles and a half long, and six wide. Like all the islands in the Atlantic, it is of volcanic origin, presenting a surface of rugged conical hills, of different sorts of lava, from 200 to 300 feet in height, some of them with perfect craters. At the eastern part of the island is a double-peaked mountain of gritty tufaceous limestone, which rises to the height of 2818 feet, and from its comparatively verdant appearance has obtained the name of Green Mountain. The whole island is of a naked, desolate character, with a vast quantity of rocks lying upon each other in a very irregular way, with great chasms between them, and strewed with scorias, pumice, and other volcanic substances, so that one might as well walk over broken glass bottles. The sea-coast is alternately of a black nitrous lava,

and of white beaches, formed by the pulverization of coral and shells, with calcined stones as light as dust. There are, however, about the middle of the island, between the hills, several little plains divided into small spaces, and so remarkably distributed as to appear like parcels of land cleared of stones, and separated by walls.

The island was discovered by João de Nova Galego in 1501, and is said to derive its present name from having been seen on Ascension Day. It was then entirely barren and uninhabited; not a shrub was seen; and the only vegetation which it produced was some coarse grasses, ferns, purslain, a species of convolvulus, and a milkthistle. There were goats, rats, mice, land crabs, and some few insects on the island. It was also much frequented by sea-fowl, such as the frigate and tropic birds, tern, boobies, and gannet, with whose nests the lower part of the island was covered; being hitherto undisturbed by man, they suffered themselves to be knocked down with sticks, or even laid hold of while sitting on their eggs. Turtle were found in great abundance, and the bay afforded a plentiful supply of fish—cavalies, old wives, conger-eels, and rock-cod, in consequence of which the island was much frequented by homeward-bound vessels from the Cape of Good Hope and the East Indies; it was also a great resort for smuggling vessels from our American colonies, who used to meet the Indians here on their return home. It was long supposed to be without any stream or spring of fresh water whatever; but small springs have since been discovered, and have obtained the name of Dampier's Springs, from that celebrated navigator having been cast away here on his return from New Holland.

In 1815, during the confinement of Napoleon at St. Helena, the British government took possession of Ascension as a military station, and maintained on it a garrison, consisting of a naval lieutenant as governor, with sixty officers, seamen, and marines, who fortified the island with seventeen guns, the greater number at English Road, where they erected barracks and storehouses of the compact lava (the pulverized coral on the beach forming excellent cement), and contrived to cultivate small gardens, and rear some live stock. A look-out station was established on Green Mountain, where a small spring was discovered which soon yielded an average daily supply of about 140 gallons.

In 1821, the establishment was changed to a major of marines, as governor, with a staff of officers and a party of about 200 privates, most of whom were artificers and labourers, with a number of liberated Africans. From the attention and exertion of the garrison, the island is now in a state of progressive improvement as to its resources, natural and artificial. Roads have been made and iron pipes laid down to convey the water from the springs (an operation that used to be performed by asses and mules) to the fort, near which a large tank has been excavated, capable of containing 1700 tuns, by which it is hoped that a supply of water may always be obtained sufficient for a squadron. Pasturage is rapidly making its appearance; there is a moderate supply of cattle and sheep, which, with turkeys, guinea-fowl, and almost every description of live stock, thrive well; geese and ducks, however, succeed but indifferently, owing to the want of fresh-water streams and pools. The wild goats, to the number of about 600, are allowed to wander in herds, feeding on the herbage they can procure, amongst which are some aromatic herbs which give a peculiarly fine flavour to the mutton. During the season, which is between February and July, when the turtle come ashore for the purpose of depositing their eggs, parties are stationed on the beach to turn as many as are likely to be required before the next season, which are afterwards kept in a large salt-water pond to be taken out at pleasure. Their general weight is from 400 to 700 pounds.

In order to destroy the rats with which the island was overrun, a number of cats were introduced, which, however, multiplying and becoming wild, proved very destructive to the young fowls and rabbits, so that the garrison have been compelled to call to their assistance a colony of bull-terriers to wage war on their combined enemies of the feline tribe. Guinea-fowl are very abundant, partridges, pigeons, and rabbits, from the Cape of Good Hope, with other species of game, have been imported, and the horse has lately been added to the list of their useful and domestic animals.

On the Green Mountain, above the height of 2000 feet, all sterility ceases; the soil is a rich mould, yielding sweet

potatoes, Cape gooseberries, onions, carrots, peas, beans, cabbages, radishes, and in short, almost every species of esculent vegetables; there are at present upwards of seventy acres under cultivation. In the valleys also, where the soil offers any prospect of success, spots are set apart for the cultivation of vegetables. Several kinds of fruit have been successfully tried, and thus an island which was once a desert cinder, now yields most useful vegetable productions; and as the climate is exceedingly healthy, it is obvious that this establishment will repay the liberal attention that has been bestowed upon it by affording an eligible rendezvous and dépôt of stores and provisions for any squadron destined either for the coast of Africa or Brazil. Including civil officers, the expense of the establishment is 10,400*l.* per annum.

The anchorage, though an open bay, is perfectly safe, and the island is never visited by gales of wind, but a heavy surf rolls on the beach, which sometimes interrupts the communication with the shore for days together. There is no regular tide, and the rise and fall is very trifling. On Green Mountain the annual range of Fahrenheit's thermometer is from 58° to 82°.

The fort is in 7° 56' N. lat., 14° 24' W. long. (Purdy's *Atlantic Memoir*, and various sources.)

ASCETICS (*ἀσκηται*), a term applied to the pugilists, wrestlers, and other athletes, among the ancient Greeks, who prepared themselves by abstinence for their combats; subsequently, the term was extended to all those who practised the severity of virtue. The exercise of severe virtue among the Pythagorean and Stoic philosophers was called *ἀσκησις*, *askesis*: it consisted in chastity, poverty, watchings, fasts, and retirement. The ascetics seem to have had an Eastern origin. The Brachmans, Germani or Sarmani, Samanœi, Hylobii or Allobii, Gymnosophists in Asia, and other sects in East-Africa, were ascetics, who like the present Sanyasseans, Talapoins, and Bonzes, in eastern Asia, exercised their ingenuity in devising new methods of self-torture. For the Jewish ascetics, see the articles *NASIREANS*, *ESSENES*. According to Eusebius (*Hist. Eccles.* ii. c. 23), James the Just, the brother of Jesus, was an ascetic at Jerusalem before the destruction of that city. The Christians were in the earlier centuries more distinguished by their purity of morals than by ascetic austerities. In the second century, the Christians began to distinguish between the commands given to all believers and the evangelical advice which they supposed to be applicable to those only who aimed at the higher sanctity of ascetics. The Christian ascetics were divided into *abstinents*, or those who abstained from wine, meat, and agreeable food, and *continentes*, or those who, abstaining from matrimony also, were considered to attain to a higher degree of sanctity. Many laymen as well as ecclesiastics were ascetics in the first centuries of our æra, without retiring on that account from the business and bustle of life. Some of them wore the *pallium philosophicum*, or the philosophic mantle, and were therefore called Christian philosophers, and formed thus the transition link to the life of hermits and monks, which was regulated in the fourth century. [See *HERMITS*, *MONKS*.] (Du Fresnoie *Glossarium Medicæ et Infimæ Latinitatis*, &c. v. *Ἀσκηται*; Mosheim, *De Rebus Christ. ante Const. M.* p. 311, &c.; Deiling, *Observationes*, t. iii. p. 645, &c. *De Vet. Ascetis*; Plato, *De Republ.* l. iii. p. 297, ed. Bip. tom. vi.; Plutarchi *Lycurgus*; Epictet. *Disert.* l. iii. c. 12, on *Askêsis*; Görres, *Mythengeschichte der Asiatischen Welt*, i. p. 138, seq. 170, 192; *Petri in Ersch und Grubers Encyclop.*; Neander's *Kirchen-Geschichte*, b. i. abth. 2; Zimmermann on *Soklitude*, pt. ii. chap. 3, *On the religious retirement in the first ages of the Christian Church*, &c.; Bryant's *Mythology*, vols. 4 and 5 of the 8vo.)

ASCHAFFENBURG, a principality, on both sides of the Main, and in the western part of central Germany: it is bounded on the N. by the Electorate of Hesse, on the W. and S. by the Grand Duchy of Hesse, and on the E. by the Bavarian dominions, of which it forms at present a portion, included in the circle of the Lower Main. It is 357 square miles in superficial extent, and, before the French revolution, belonged to the Electorate of Mentz. In 1803 it was made over to Archbishop Charles of Dalberg, ephemeral Arch-Chancellor elect under Napoleon; three years afterwards it was annexed to the Grand Duchy of Frankfort, and in 1814 it was transferred to Bavaria, by virtue of the treaty concluded on the 19th of June between that power and Austria, and in exchange for the greater part of the territory of Salzburg, and some minor dependencies. The

noble forests of the Spessart and Odenwald occupy a considerable part of the eastern surface of this principality: the former alone is nearly seventy miles in length, and occupies an area of 672 square miles, between the most northern limit of Aschaffenburg and the territory of Würzburg: the elevated ridge on which the forest stands is a subsidiary range of the Rhetian Alps, and is rich in copper, cobalt, arsenic, lead, and iron. The Geysersberg (or Vulture's Mount) near Rohrbrunn, which has an elevation of 1875 feet, is the highest point in the Spessart. The district of Aschaffenburg, in the Bavarian circle of the Lower Rhine, which includes the town, contains sixty and a half square miles, extends on both sides of the Main, and has a population of about 13,000 souls.

Upon an eminence, forming the termination of a western declivity of the Spessart chain, and on the right bank of that river, in one of the most delightful sites which can be imagined, stands the town of Aschaffenburg, whose municipal existence dates from the eighth century at least. It is surrounded by walls on all sides but that towards the river, is irregularly built, and the streets are mostly narrow, steep, and crooked. The pride of its inhabitants is the Johannisburg, a handsome palace, forming a large and regular square, with towers to each face; it crowns the highest ground in the town, lies close upon the banks of the Main, and was erected by the elector of Mentz between the years 1605 and 1614. He and his successors used it as their hunting-seat, and it is still the occasional residence of the crown-prince of Bavaria. Attached to it are a library, picture-gallery, cabinet of engravings, collection of ecclesiastical rarities brought from the old collegiate church, besides an interesting series of models in cork of antient temples and ruins. The immediate vicinity of the palace abounds in picturesque scenery, and an orangery and botanic garden adjoin its beautiful grounds. The old Gothic collegiate church, which contains the tombs of its princely proprietors, and particularly that of Otho duke of Bavaria, who founded it, the massive buildings of the antient university, the former mansion of the Teutonic order, and the town-hall, are all deserving of inspection. There are also a lyceum, gymnasium, ecclesiastical seminary, an institution for the education of females conducted by the English sisterhood, and a school of design and modelling in the town. Aschaffenburg is celebrated for its manufacture of coloured papers, and carries on a considerable traffic in timber, tobacco, perfumery, wine, and other articles of luxury. The asylum for the indigent is well organized, and has separate accommodation for the infirm and orphans, a hospital, house of industry, &c. Aschaffenburg contains nearly 900 houses, and has eight churches, and 6700 inhabitants. It lies (according to Stein) in 50° 1' 29" N. lat., and 9° 7' E. long., 25 miles S. E. of Frankfort.

ASCHAM, ROGER, was born in 1515, at Kirby Wiske, near North Allerton, in Yorkshire. His father was house-steward in the family of Scroope, and his mother, whose maiden-name is not recorded, is said to have been allied to many considerable families. Roger, their third son, having passed his first years under the care of his parents, was adopted into the family of Sir Anthony Wingfield, who committed his education, with that of his own sons, to a domestic tutor of the name of Bond; and afterwards, in 1530, placed him at St. John's College, Cambridge, then one of the most flourishing in the University.

The destruction of the Constantinopolitan empire had, previous to this time, dispersed the Greeks and their language through Europe, though undoubtedly Greek was known by a few individuals in western Europe long before this time. But Greek now began to be taught in the Universities, and more especially at Cambridge, where a taste for this study had been raised by Cheke and Smith. Immediately upon his admission into college, Ascham applied himself to the study of that language; and, when he had arrived at some proficiency, with a view to quicken his improvement, is stated to have read lectures in it, while yet a boy, to other boys who were desirous of instruction.

Ascham took his bachelor's degree in the month of February, 1534, and on the 23d of March following was chosen fellow of his college: which election, says Dr. Johnson, he considered as a second birth, because it relieved him from the necessity of longer dependence on the bounty of Sir Anthony Wingfield, for whom he always retained a grateful and affectionate remembrance.

In Wingfield's family, Ascham had been educated in the

doctrines of the Romish church; but new learning and new tenets of religion were gaining ground; he entered into the controversies of the day, and gradually became a Protestant. Nor did his love for an academic life confine him to its severer studies only. He was eminent for other accomplishments. He had learned to play on musical instruments, and was one of the few who excelled in the mechanical art of writing; an art at that time highly valued, and the cultivation of which, as an adjunct to his learning, had an influence upon his future fortune.

He became M.A. in 1537, in his twenty-first year; and then, if not before, commenced tutor. Many of his scholars rose to eminence, and one of them, of the name of William Grindal, was made master of languages to the Lady Elizabeth.

As yet, it appears, there was no established lecturer in Greek at Cambridge: the University therefore appointed Ascham to read in the public schools, and paid him from the public purse an honorary stipend; but a lecture being founded by Henry VIII., Ascham quitted the schools, and returned to explain Greek authors in his own college. He was one of those who restored the pronunciation of Greek to our own modern mode of utterance.

To divert himself after the fatigues of study, his favourite amusement was archery; in which he spent or (according to some who censured him) lost much time. They possibly thought it an amusement of bad example in a place of education. To free himself from this censure, he wrote a small treatise, in which the praise and precepts of archery are joined, entitled *Toxophilus*, published in 1544, and dedicated to King Henry VIII., for which the king, at the suggestion of Sir William Paget, rewarded him with a pension of ten pounds a-year, a sum at that time of course worth more than at present.

Ascham, with this allowance and the enjoyment of his fellowship, must have been at least easy in his circumstances. The same year that he published his book he was chosen University Orator, in which office he wrote all the University letters to the king, and to the great men at court. About this time too it appears he was employed in teaching many illustrious persons to write a fair hand, and among others, Prince Edward, the Lady Elizabeth, and the two brothers, Henry and Charles, dukes of Suffolk.

In 1548, upon Grindal's death, Ascham was called to court, to instruct the Lady Elizabeth in the knowledge of the learned languages, a duty which he discharged for two years, with great reputation to himself, and much satisfaction to his illustrious pupil; but at length, on account of some ill-judged and ill-founded whispers, Ascham took such a distaste to some persons in the Lady Elizabeth's family, that he left her a little abruptly. Dr. Johnson says, 'Of this precipitation he long repented; and as those who are not accustomed to disrespect cannot easily forgive it, he probably felt the effects of his imprudence to his death.' Chalmers says 'he took great and not unsuccessful pains to be restored to her good graces.'

On returning to the University he resumed his studies and the discharge of his office as public orator. His pension had ceased upon the death of Henry VIII., but it was restored by King Edward VI. Other pecuniary assistance also reached him from lovers of learning, and he had a small pension from Archbishop Lee.

In the summer of 1550 he took a journey into Yorkshire to see his native place and old acquaintance, where he received a letter from the court acquainting him that he was appointed secretary to Sir Richard Morysine, then going ambassador to the Emperor Charles V. In his return to London, he paid that memorable visit to the Lady Jane Grey, at her father's house at Broadgate in Leicestershire, where he found her reading the 'Phædon' of Plato in Greek. An interview, the particulars of which he has affectingly detailed in his *Schole-master*.

On the 20th of September following, he embarked with Sir William Morysine for Germany, where he remained three years, and wandered over a great part of that country making observations upon all that appeared deserving of his notice. He made a short excursion into Italy, and mentions, in his 'Schole-master,' with great severity the vices of Venice. Dr. Johnson says 'he was desirous of visiting Trent while the council were sitting; but the scantiness of his purse defeated his curiosity.' While he was abroad, Ascham wrote a short but curious tract, entitled 'A Report and Discourse of the Affaires in Germany,' in which

says Dr. Johnson, 'he describes the dispositions and interests of the German princes like a man inquisitive and judicious, and recounts many particularities, which are lost in the mass of general history, in a style which to the ears of that age was undoubtedly mellifluous, and which is now a very valuable specimen of genuine English.'

He was of great use to the ambassador, not only in the management of public business, but in the direction of his private studies, which were for the most part in the Greek language. For four days in the week he explained three or four pages of Herodotus every morning, and more than two hundred verses of Sophocles or Euripides every afternoon. He read with him likewise some of the orations of Demosthenes. On the other three, he copied the letters which the ambassador sent to England; and in the night filled up his diary, digested his remarks, and wrote his own private letters—many to his college—which showed that, in spite of the advantages of novelty and station, he sighed for his return to academical retirement.

While thus employed, his friends in England, in 1552, procured for him the post of Latin secretary to King Edward: but the King, in a short time, died; Morysine was recalled; and Ascham, who came back with him, once more retreated to his fellowship. He had, however, better fortune than he expected. Lord Paget recommended him to the notice of Gardiner, bishop of Winchester, and, though a protestant, his pension was doubled; and he was again instated in the office of Latin secretary, retaining at the same time his fellowship, and his post of public orator. Soon after his re-admission to the office of Latin secretary, he is said to have given an extraordinary specimen of abilities and diligence, by composing and transcribing, with his usual elegance, in three days, forty-seven letters to princes and personages of whom cardinals were the lowest. He was patronised at this time by Cardinal Pole, who, though he wrote elegant Latin himself, sometimes made use of Mr. Ascham's pen.

On the 1st of June, 1554, Ascham married Mrs. Margaret Howe, a lady of good family, who, Chalmers says, brought him a considerable fortune; and of whom he has given an excellent character in one of his letters to his friend Sturmius.

On the death of Queen Mary, in 1558, having previously been reconciled to the Lady Elizabeth, now Queen, he was immediately distinguished by her; and from this time, until his death, he was constantly at court, fully employed in his two offices, one of secretary for the Latin tongue, and the other of tutor to her Majesty in the learned languages, reading some hours with her every day.

In 1559, Queen Elizabeth gave him the prebend of Westwarg in the church of York. This appears to have been his only preferment in addition to his places. In 1563, he was invited by Sir Richard Sackville to write 'The Schoolmaster,' a treatise on education, upon an occasion which he relates in the beginning of the book. This work, though begun with alacrity, in hopes of a considerable reward, was interrupted by the death of the patron, in 1566, and afterwards sorrowfully and slowly finished, in the gloom of disappointment, under the pressure of distress. But of the author's disinclination or dejection, there can be found no tokens in the work, which is conceived with great vigour, and finished with great accuracy; and perhaps, says Dr. Johnson, contains the best advice that was ever given for the study of languages. This treatise he completed, but did not publish. It lay unseen in his study, and was at last dedicated to Sir William Cecil by his widow in 1571. Some account of this work of Ascham's, and of his mode of teaching languages, is given by Mr. John Taylor, in his *Essay on a System of Classical Instruction*, London, 1829.

Some time before his death, Ascham was seized by a hectic disease, the most afflictive symptom of which was want of sleep. It was increased by night-studies, when trying to complete a Latin poem which he designed to present to the Queen on the new year; but, on the 23d of December preceding, he was attacked by an aguish distemper, under which he lingered only seven days, and died Dec. 30, 1568. He was interred, on the 4th of January following, in the church of St. Sepulchre, by Newgate.

Although his wife is said to have brought a fortune to Ascham, it is evident that he died in indifferent circumstances, leaving, as she expresses it in the dedication of 'The Schoolmaster,' 'a widow and a great sort of orphans.'

There seems reason to believe that Ascham was improvident. One of his failings is recorded to have been a propensity to dice and cockfighting. As a scholar and a man, however, he died universally lamented; and Grant, who wrote his life, says, that when Queen Elizabeth heard the news of his death, she exclaimed 'she would rather have thrown ten thousand pounds into the sea, than have lost her Ascham.'

The only works which Ascham himself published were 1. *Toxophilus, the Schole of Shootinge*, 4to. Lond. 1545; repr. 4to. Lond. 1571; 4to. Lond. 1589, with a pref. by J. Walters; 12mo. Wrexham, 1788. 2. *A Report and Discourse of the Affaires and State of Germany and the Emperour Charles his Court*, 4to. Lond., J. Day. After his death were printed, 3. *The Scholemaster, or plaine and perfitte way of teaching Children, to vnderstand, write, and speake the Latin tong*, 4to. Lond. 1571; repr. 4to. Lond. 1589; revised by James Upton, 8vo. Lond. 1711 and 1743. 4. *Apologia Doct. Viri. R. A. pro Cæna Dominica contra Missam et ejus prestigias, in Academia olim Cantabrigiensi exercitationis gratiâ inchoata*, 8vo. Lond. 1577. 5. *Familiarum Epistolarum Libri tres; addita sunt pauca quedam Rogeri Aschami Poemata; omnia collecta operâ et studio E. G. Adjecta in fine ejusdem E. G. Oratio de Vita et Obitu Rogeri Aschami, et ejus dictionis elegantia*, 12mo. Lond. 1576, 1577, 1578, 1590; Hanau, 1602, 1610. Col. Allob. 1611; the last and best edit. (with the omission of the Poems) by W. Elstob, 8vo. Oxf. 1703. Ascham's English works were published by the Rev. James Bennet, 4to. Lond. 1767, with a Life of Ascham prefixed by Dr. Johnson; repr. 8vo. Lond. 1815. A few of Ascham's original Letters are preserved among the Lansdowne Manuscripts in the British Museum. (See the Latin Life of Ascham, subjoined to the different editions of his Letters, by Edw. Grant, Master of Westminster School, the ground-work of all the biographies of Ascham; Johnson's Life; Strype's Crammer; Biogr. Brit.)

ASCHERSLEBEN, a circle in the south-eastern part of the Prussian province of Magdeburg, containing 168½ square miles, and, according to the census of 1831, 41,059 inhabitants. It possessed at that time 2866 horses, 6036 head of horned cattle, and 67,129 sheep and goats. Quedlinburg is its capital. It is an uncommonly fertile tract of level country, and raises large quantities of corn, flax, and rapeseed. Aschersleben was part of the bishopric of Halberstadt, which was secularized in 1648, and fell to the share of Brandenburg. Between the years 1807 and 1813 it was incorporated with the short-lived kingdom of Westphalia.

The town of this name lies within the circle, close to the confluence of the Wipper and Eine, and on the banks of the last-mentioned river: 51°46' N. lat., 11°27' E. long.; and 18 miles S. E. of Halberstadt. In former times it belonged to the earldom of Ascania, of which the bishop of Halberstadt made himself master in the year 1319. The town is surrounded by walls, with five gates; and has three churches, as many hospitals, a gymnasium, and orphan asylum. The number of its inhabitants, nearly the whole of whom are Lutherans, was, in 1831, 9538. It has very considerable manufactures of flannels, friezes, linens, earthenware, &c. Aschersleben was formerly a Hanse-town. The picturesque ruins of the ancient burgh of Ascania, the patrimonial seat of the house of Anhalt, are in its neighbourhood.

ASCIDIA, a genus of molluscous animals belonging to Cuvier's order of Accephalæ without shells. Savigny has considered these animals sufficiently important to constitute a class, under the name of Ascadies (Ascidia); while Lamarck has also formed them with others into a class, under the name of Tuniciers (Tunicata.) [See MOL-LUSCA.]

ASCLEPIADÆ. [See ÆSCULAPIUS.]

ASCLEPIA'DEÆ. Among dicotyledonous plants there is a natural order which may be known from all others by the single character of its grains of pollen adhering together within a sort of bag which occupies the whole of the inside of each cell of the anther; and when it falls out sticks to glands of a peculiar character occupying the angles of the stigma. Independently of this circumstance, the anther and stigma adhere firmly together, and the fruit is a very curious body, consisting of two carpels, which, when young, are parallel to each other, and united at the point, but when ripe are both on the same plane, pointing in different directions, and shedding a large quantity of seeds, the end of which terminates in long down.

To this order the name of asclepiadeæ has been given, in

[*Asclepiades*.]

1. A flowering shoot of *Asclepias syriaca*. 2. A single flower magnified. 3. The same seen from above; the centre is occupied by a broad cushion-like stigma. 4. The anthers much magnified; a, one of the horned processes of the corolla. 5. The same cut vertically, and less magnified; a, one of the horned processes. 6. Pollen masses; a, the gland. 7. One half of a ripe fruit. 8. A transverse view of its inside near the point, showing how the seeds are arranged. 9. Seed. 10. The same cut across. 11. The same cut vertically, showing the embryo. 12. The embryo separate.

consequence of the genus *asclepias* being the largest which the order contains. It consists of shrubs or herbaceous plants, abounding in an acid and usually milky juice, and found in their greatest abundance in tropical countries, but rarely in cold latitudes. At the Cape of Good Hope they form a singular stunted deformed vegetation, in the form of the leafless succulent *stapelias*, the flowers of which are among the most fetid productions of the vegetable kingdom. A great many species of *asclepias* inhabit North America, and for their beauty are frequently cultivated in Europe, especially the orange-coloured *asclepias tuberosa*. Their roots are acrid and stimulating, and usually emetic. Their flowers have curious horned processes, added to the corolla.

ASCLEPIADES. This name was common to a great number of persons, which has caused some confusion both in the ancient and modern accounts of *Asclepiades* the physician, of whom only we are going to treat.

Asclepiades was a native of Prusa in Bithynia, but the time of his birth is unknown, nor can we ascertain which of the three towns of Bithynia called Prusa claims the honour of his birth. He appears, when young, to have spent some time at Alexandria, and at Parium, on the Propontis; probably also at Athens, where, if the story told in *Athenæus* (iv. p. 168) refers to him, he gained his living at first by grinding at a mill during the night, in order that he might attend the lecturers on philosophy during the day. In Athens he appears to have been on terms of intimacy with Antiochus, the academician, the master of Cicero.

It is not known in what year he came to Rome, but he lived there at least during the earlier part of Cicero's life: he was probably some years older than the Roman orator. He is said to have lived to a great age, free from all disease, and to have died by accidentally falling down stairs.

The foundation of the healing system of *Asclepiades* was the doctrine of corpuscles, which he borrowed from *Heraclides of Pontus*. His corpuscular elements, which he called *ongkoi* (*ὄγκοι*), differed from the atoms of *Epicurus*: they were without form, but still divisible, and subject to change. From the collision of these corpuscles in space, from their fracture, and the accidental union of the fractured parts, arose visible bodies. Thus from a union of corpuscles arose the human form; and the motion of the corpuscles, which compose the body, in the spaces assigned to them, or their pores, produce health or sickness, according as the motion is proper and harmonious, or the reverse. On this arbitrary theory all his pathology was founded. It seems to be a natural consequence that he was little acquainted with anatomy, as *Galen* remarks: he had no exact notion of the difference between the veins and arteries, he was unacquainted with the use of the nerves, and he confounded them with the ligaments.

He is said to have been the first who divided diseases into acute and chronic, and to have considered them essentially different. Like his predecessors, he considered fever as an unnatural heat in all or most parts of the body, connected with a quick pulse; and he attributed it, as well as inflammation, to obstruction. When the larger corpuscles cause a more stubborn obstruction, more dangerous fevers arise: when the obstruction is caused by the finest particles fixing themselves in the pores, the fever is less violent. Accordingly, the character of intermittent fevers is explained by the various size of the corpuscles, since it is the finest particles that cause obstruction in a quartan, the larger in a tertian, and the largest of all in a quotidian fever.

He observed the double-tertian fever which was so common in Rome, and is described by writers after him. [See *AGUE*, vol. i. p. 223.] He distinguished very accurately between the violent or febrile dropy, and the chronic one, unaccompanied with fever.

The practice of *Asclepiades* was in many respects good. He trusted more to dietetic means than to the use of medicines; and often recommended a change in the mode of living, in which he studiously attended to the most minute particulars. He disapproved of the frequent use of emetics and purges, and in place of the latter he recommended clysters. Blood-letting he practised pretty often, especially in inflammatory cases; but yet he considered that this practice was not equally useful in all climates. On the Hellespont, near his native country, it was often very serviceable, but in Rome and Athens frequently dangerous. He recommended cupping to be used with great caution.

He approved of friction in many cases, the gentle motion of the sick in a kind of hanging bed, and to him we must

perhaps attribute the shower bath, *penilis balinearum usus* (see Plin. xxvi. 3), if Sprengel's interpretation is right. Asclepiades gained great favour among the Romans by his use of wine in many complaints, in which, up to his time, it had not been employed; yet he prescribed it with caution. Sometimes he used it even in febrile cases to restore the drooping strength, and he prescribed it also to persons who were convalescent. Laughter, music, and singing he also considered as frequently efficacious in the cure of diseases.

The school which Asclepiades founded continued for some time, and produced several writers, who diffused his principles and practice with more or less exactness.

Asclepiades, according to Pliny (xxvi. 3), was originally a rhetorician; Cicero also (*De Orat.* i. 14) speaks of his eloquence. Pliny treats him as an impudent quack, who gained great practice by humouring the whims of his patients, and prescribing such remedies as would be sure to please. If we are inclined to view him as an adventurer in the medical line, such as start up occasionally in modern times, still, as much of his practice was very good and safe, we may give him credit for being at least a clever quack.

For further information on Asclepiades, see Sprengel, *Versuch einer pragmatischen Geschichte der Arzneikunde*, 2nd ed. Halle, 1800, vol. ii. 6-27; and Asclepiadis Bithyni *Fragmenta*, by Gumpert, Weimar, 1794; Chr. F. Harless, *Medicorum veterum, Asclepiades, &c.* Bonn, 1828.

ΑΣΚΛΗΠΙΑΔΗΣ.

The bust of Asclepiades is only presumed to be his on the ground of the name occurring upon it, and from the improbability of its belonging to any other person of the same name, all of whom were men of much less note than the physician.

A'SCOLI, (*Asculum Picenum*), a town in the Papal State, in the province called *La Marca*, and in the administrative delegation of "Fermo ed Ascoli." It lies on the right or southern bank of the Tronto, and between it and the Castellano, just above the confluence of the two rivers, in 42° 50' N. lat., and 13° 37' E. long. It is built on a rising ground, commanding a fine and fertile plain, which is enclosed by the Apennines, except on the eastern side, where the river Tronto flows through a valley towards the Adriatic Sea, from which Ascoli is distant seventeen miles. The main ridge of the Apennines rises about ten miles westward of Ascoli, forming the high summit called Monte della Sibilla, 7212 feet high. The valley of the Tronto is celebrated for its fertility: it abounds in vines, olive, and other fruit trees, and is studded with villages and country-seats. The mouth of the Tronto, called Porto d'Ascoli, is defended by a castle; and there is anchorage for small vessels. Ascoli is a frontier town of the Papal State, being only three miles from the boundary of the kingdom of Naples, and fifteen miles N.W. of Teramo, the chief town of Abruzzo Ultra II. A post road leads from Ascoli to Teramo, and thence to Sulmona and Naples. Another road leads from Ascoli eastwards to the mouth of the Tronto, and thence northwards along the Adriatic coast to Fermo and Macerata, where it joins the high road from Loreto to Rome. The Via Salaria was formerly the direct road from Rome to Asculum; after passing Reate it ascended the valley of the Velino, and crossed the Apennines between the sources of that river and those of the Tronto.

The origin of Asculum is lost in the obscurity of the ante-Roman ages. Its foundation has been attributed to the Sabines, who sent a colony north of the Apennines, whose descendants the Picentes were. The name of Asculum has been conjectured to be derived from a species of oak called in Latin *æsculus*, and now by the natives *eschio*, with which the neighbouring mountains abound. Asculum was the chief town of the Picentes, and it was at one time allied to Rome; but having afterwards declared against the latter, was taken after a battle by the consul Publius Sempronius, B.C. 275. After a lapse of nearly two hundred years, passed in subjection to Rome, the people of Asculum joined the Marsian confederacy, and began the social war by killing the Proconsul Servilius, and all the Romans whom they found within their territory. Cneius Pompeius Strabo marched against them, but was defeated and driven within the walls of Firmum. Servius Sulpicius, coming with reinforcements, defeated the confederates, killed Afranius their general, and liberated Pompeius. The following year Pompeius, who was then consul, marched with a fresh army and besieged Asculum. Titus Judacilius, a native of the place, and one of the chief leaders of the confederates, hastened to its assistance, but not being properly seconded by the inhabitants, he could only succeed in throwing himself into the town with eight cohorts. He then put to death those who had been the cause of his failure, and seeing no chance of deliverance, having assembled his friends, he drank poison, recommending them to follow his example rather than behold the destruction of their country. Asculum soon after surrendered at discretion. The consul treated the inhabitants with the utmost severity. The chief citizens were whipped with rods, and then put to death: the rest were led prisoners to Rome or sold as slaves. Their property was confiscated to the Roman treasury, and the moveables given up to the plunder of the soldiers. Among the prisoners who followed the triumphal car of Pompeius, was the wife of Ventidius, one of the chief citizens of Asculum, carrying a child in her arms. This child became afterwards one of the most illustrious generals of Rome, fought under Julius Cæsar in Gaul, and afterwards was Antony's lieutenant in the east, where he defeated the Parthians and avenged the death of Crassus. The booty made by Pompeius at Asculum was very great after his death, his son, known afterwards as the great Pompey, was charged, among other things, with having appropriated to himself some books from the plunder of Asculum. (Plutarch, *Life of Pompeius*, cap. 3.) These books were afterwards taken by Cinna, in the pillage of Pompeius's house, during the factions of Marius and Sylla. Asculum was afterwards restored by the Romans who sent a colony there; and it continued to be the principal town of Picenum. After the fall of the empire, it suffered by the irruptions of the barbarians; its bishops, however, retained, from the 5th to the 13th century, a sort of authority over the town and district; and they continued, until the end of the last century, to be styled Bishop Princes of Ascoli. In 1213, Pope Innocent III. gave Ascoli to Azzo of Este, who was succeeded in it by his son Aldovrando. The town was taken and devastated by Manfred, and retaken by Charles of Anjou. It was for some time under the rule of the Malatesti, the lords of Rimini. It was afterwards united to the kingdom of Naples by Ladislaus. In 1413, it came under the power of the Princes of Carrara, whose authority was confirmed by Queen Joanna II. In 1426, Pope Martin V. having quarrelled with Joanna, took Ascoli, and annexed it to the Papal State, to which it has remained attached ever since.

Ascoli is one of the best built and most pleasant towns in the Papal State. Its buildings are constructed of *travertino*, with which the country abounds. There are eight parochial churches, besides the cathedral, several convents, and a seminary. The churches are rich in paintings, most of which are by native artists; for Ascoli has been remarkably prolific of painters, as well as sculptors and architects. The most noted are the painters Trasi and Ghezzi; and the three sculptors of the name of Giosafatti. On the square del Duomo is the *palazzo anzianale*, a handsome structure, which contains the theatre, a library, and a museum. On the square del Popolo is the government house, where the Papal governor resides. There are many other palaces belonging to the nobility. Among the few remains of antiquity are those of a Roman temple, which has been converted into the church of S. Gregorio Magno, having several

Corinthian columns with capitals of beautiful workmanship. Ascoli is surrounded by walls and towers, and has a castle. It was once considered a strong place, on account of its situation. It is a bishop's see, and has a population of 12,000. Pope Nicholas IV. was a native of Ascoli. Francesco Stabili, commonly called 'Cecco d'Ascoli,' was also born here in 1257. He was physician, philosopher, astrologer and poet. He wrote *l'Acerba*, a desultory poem upon natural philosophy and ethics, in which there are some powerful passages; but the language is much inferior to that of Dante, whose contemporary Cecco was.

ASCOLI DI Satriano (*Asculum A'pulum*), a town of Apulia, in the province of Capitanata, situated on a hill near the river Carapella, in 41° 9' N. lat., and 15° 27' E. long., ten miles S.E. of Bovino, and on the cross road from it to Venosa. It is a bishop's see, and gives the title of duke to a Neapolitan family. It is a small town, and we find that the whole diocese had not more than 8250 souls at the close of the last century. Asculum was antiently one of the principal towns of Daunia. It is first mentioned in history on the occasion of the war of Pyrrhus, who fought a battle against the Romans in its neighbourhood. Having afterwards espoused the cause of Hannibal, its territory was given up to the Roman veterans after the expulsion of the Carthaginians. It became afterwards a Roman colony, and its inhabitants were called Asculanenses, being thus distinguished from those of Asculum Picenum, who were called Asculani. Minatius Magius, the ancestor of Velleius Paterculus, was a native of Asculum. (V. Paterc. ii. 16.) Asculum was destroyed by Roger the Norman, but was afterwards restored. It is 66 miles E.N.E. of Naples.

ASCONIUS, Q. PEDIANUS, one of the earliest commentators on Cicero, who is usually considered to have been a native of Padua, though the opinion rests on no surer ground than a passage of Silius Italicus (xii. 212) where he mentions a person of the same name as a native of this city. We are unable to fix the exact period of his birth and death; but from a passage in one of his commentaries (*Ad Orat. pro Scaur.* p. 176, ed. Lug. Bat.) he was employed on his work about A.D. 41, in the reign of Claudius. Philargyrius, quoted by Servius (Virg. *Ecl.* iii. 106), states that he was in his youth the friend of Virgil; but he must have been a mere boy when the poet died, A.D. 19, if Eusebius is correct in making him seventy-three years of age in the seventh year of Vespasian's reign, A.D. 76. At that time he became blind, and survived the calamity twelve years. (Euseb. *Chron. ad Olymp.* cccxiii. 3.) This circumstance has induced some to suppose that there were two of this name; one, the friend of Livy and Virgil, and the commentator on Cicero's works, the other, an historian of a later period; but such a supposition is opposed by the concurrent testimony of the antients. These are the only facts which are known of his private history. Asconius was the author of a work which has been lost, directed against the calumniators of Virgil, and also of a *Life of Sallust* (*Acron. ad Hor. Sat.* 1, 2;) but there seems no reason to suppose that he was the author of the work '*Origo Gentis Romanæ*,' usually ascribed to Aurelius Victor. The most important of his labours was his *Commentary on the Orations of Cicero*, which he wrote for the instruction of his sons (*Ad Orat. pro Mil.* 6); but under what title, none of the manuscripts enable us to decide. It seems to have extended to all the orations; but only fragments have been preserved, which, though in some of them much disfigured by the glosses of some ignorant grammarian, are still full of valuable information. We are indebted for the greater part of what we possess of Asconius to Poggio, the Florentine, who, during the Council of Constance, A.D. 1416, luckily discovered an old manuscript of it at the Monastery of St. Gall, in Switzerland. This manuscript can no longer be found; but the copy of Poggio is still in the possession of the Biblioteca Riccardiana at Florence. It contained fragments of a commentary on nine orations: *Divin.*; *In Verrem*, 3; *Pro Corn.*; *In Tog. Cand.*; *Contra Pis.*; *Pro Scaur.*; and *Pro Mil.* The general character of the commentary is, that it refers chiefly to historical facts, and has preserved some curious information on various points, with which we should not otherwise have been acquainted. We may more particularly notice the speeches of Cæsar against Dolabella; of Brutus for Milo; of Lucceius against Catiline; and of Cominius against Cornelius. The historians on whom he seems chiefly to depend for his information are Livy, Sallust, and Fenes-

tella. The commentary on the *Orations against Verres* is of so entirely different a character from that on the others that it seems not an improbable conjecture that it is the work of some later writer, who availed himself partly of the labours of Asconius. The Latinity is full of barbarisms, and it is more in the style of later grammarians, who devoted their attention chiefly to observations on grammar, etymology, and synonyms. [See Niebuhr. *Prefat. ad Front.* p. xxxiv. not. 4. ed. Berl.] Angelo Mai ascribes to Asconius Pedianus some scholia which he lately discovered in a palimpsestus of the Ambrosian Library at Milan, and published in 1814. They are notes on the oration *Pro Scauro*, and on the lost orations, *In Clodium et Curionem*; *De Ære alieno Milonis*; *De Rege Alexandrino*; besides on the still extant orations *Pro Archia*, *Pro Sylla*, *Pro Plancio*, *In Vatinius*. They cannot, however, be considered the genuine productions of Asconius; neither in style, nor in the kind of information they convey, do they resemble his commentary. Another MS. of the tenth century was afterwards discovered at the same library, containing short scholia on the four orations against Catiline, on those *Pro Marcello*, *Pro Ligurio*, and *Pro Deiotaro*. Angelo Mai has still more lately discovered another MS. in the Vatican Library, which he published in 1828, being a collection of the inedited fragments of a commentary on Cicero's *Orations*. (*Auctor. Class. e Vatic. cod. editi Angel. Mai.* Rom. 1828.) The first edition of Asconius was published, Ven. 1477; with the scholia of Manutius, Ven. 1547; by Haacke, Lugd. Bat. 1644. See *Fabric. Bibl. Lat.* 11, 6; Madwig. *De Q. Asconii Pediani et aliorum veter. interp. in Cic. Orat. Commentariis Disput. critic.* Havniæ, 1825; Bæhr. *Geschichte der Römischen Literatur*, Carlsruhe, 1832.

ASDRUBAL. [See **HASDRUBAL.**]

ASEDI. [See **ASSEDI.**]

ASEERGHUR, a strongly fortified town in the province of Candeish, and within the government of the Bombay Presidency. This fortress, with a small adjacent tract of unproductive land, mostly jungle, is in possession of the English; the surrounding territory is subject to Scindia. The town is in 21° 28' N. lat., and 76° 23' E. long., and is situated about twenty miles to the north-east of the city of Boorhanpore, the antient capital of the Candeish province. Aseerghur is said to have been founded by a wealthy Hindu Zamindar, named Assa, and to have taken its name from that of the founder: it was considered as the capital of Candeish when that province was subdued by the emperor Akbar. The fortress crowns the top of a hill 750 feet high, the base of which is for the most part precipitous to the depth of 80 or 100 feet, leaving only two avenues of access, both of which are well fortified. This fortress has the further advantage of being abundantly supplied with water. Its importance, in the eyes of the natives, may be estimated from a name by which it was long distinguished, the key of the Deccan.

Aseerghur surrendered, without much resistance, to the army under Colonel Stevenson in 1803; but on the conclusion of peace was restored to Scindia. It made a much better stand in 1819 against a besieging army of 20,000 men, under Generals Doveton and Malcolm; but was at length captured, after sustaining a bombardment of sixteen days, with the loss of 213 men killed and wounded, on the part of the English. The loss, on the part of the garrison, was 138 killed and wounded. On this occasion an entire company of Sepahis, in the pay of the English, were destroyed by the explosion of the magazine, which contained three hundred barrels of gunpowder.

The pethah, or suburb of Aseerghur, stands at the base of the hill whereon the fortress is erected. It is a large irregular village, with only one good street: in 1822 it contained about 2000 inhabitants.

The approach to Aseerghur is through a wild tract of country much infested by wolves and tigers, the latter of which are so daring, as sometimes to have entered the town and carried off some of the inhabitants. Until 1824, the civil and military establishment of Aseerghur was under the Bengal Presidency, but was then transferred to the government of Bombay. (Mill's *History of British India*; Hamilton's *East India Gazetteer*; Major Rennell's *Memoir*.)

ASELLI (or, according to the custom formerly prevalent of Latinizing the name, **ASELLIUS**), CASPAR, a physician who was born in the sixteenth century at Ticino, or Ca-

mona, and became professor of anatomy at Pavia. He is regarded as the discoverer of the *lacteals*, or the set of vessels which absorb or suck up the nutritious portion of the food of animals, i. e., the chyle from the upper part of the intestinal tube, in order to convey it to the heart and lungs, so that it may become incorporated in the circulating fluid or blood. It is certain that, in 1622, he saw these vessels, and from the white colour of the fluid they contained, from the milk-like character of which is derived the name of *lacteal*, distinguished them from the other vessels, and demonstrated them in his lectures. But he was conducted by chance to make these observations, in the course of dissections for other purposes; and he does not appear to have traced the lacteals accurately, for he thought that they terminated in the liver, whereas they terminate in the mesentery.

He drew up, but never published, an account of his discovery. This treatise was printed after his death, which happened in 1626. It is entitled, 'De Lactibus; seu lacteis venis, quarto vasorum meseraicorum genere, novo invento, Dissertatio,' with figures of the vessels in three different colours: 4to. Milan, 1627, and 4to. Basle, 1628; Leyden, 1640, and again 1641, and 8vo. at Amsterdam, 1645, and lastly among the works of A. Spigelius, folio, Amsterdam, 1645.

Aselli left a MS. treatise on poisons, but it does not appear to have been published.

ASH. [See FRAXINUS.]

ASH, MOUNTAIN. [See PYRUS.]

ASHANTEES, a powerful nation of western Africa. Mr. Bowdich (*Mission to Ashantee*, quarto, London, 1819, p. 228) was inclined to think, from the little he could collect, that the state had been founded by an emigration of a number of families from a former residence of the tribe; the situation of which he conceives to have been to the south-east of the district in which the new kingdom was first established. He states, that the common tradition, which he had never heard contradicted but once, is, that the Ashantees emigrated from a country nearer the sea side, and founded their present kingdom, after subduing certain nations further advanced in civilization than themselves, whose arts, and a portion of whose language, they adopted. The Ashantee, Fantee, Warsaw (Wossa), Akim, Assin, and Aquapim languages, he considers to be indisputably dialects of the same common tongue; and from this and other evidence he infers, that the nations now distinguished by these different names were originally one people. A tradition, indeed, still subsists, that all these tribes are the descendants of twelve families: and from one or other of these stocks individuals in each tribe still claim a descent, branches of the same line being found spread among all the different tribes. There is also a general tradition that their original settlement was not on the coast, but somewhere in the interior, from which they were driven by a foreign power. This appears to be the substance of Mr. Bowdich's account, so far as we can understand it.

The statement of Mr. Dupuis (*Journal of a Residence in Ashantee*, quarto, London, 1824, p. 224) is more specific. He says, that it is agreed by all that the original seat of the tribes of Ashantee, Gaman, Dinkira, and Akim, was in Ghobago, Ghofan, and Tonouma, districts in the interior immediately to the north of the present Ashantee Proper; and that from their possessions here they were driven southward into the forest by the Moslems many ages ago, or, as the author expresses it, 'in the early age of Islam.' It was after this that the tract nearer to the coast was gradually peopled by the Fantees, Dinkirans, and other tribes, who were all, in fact, previously established along with the Ashantees in the upper country. As to this point, therefore, it will be perceived, the two accounts are directly opposed, the one making the founders of the Ashantee empire to have been a band of emigrants who separated from the rest of their nation; whereas, according to the other, the Ashantees were the original stock who remained stationary, after being driven southward by the Moslems, while different branches left them to seek habitations nearer the sea-coast. We think the latter the more probable account. Mr. Bowdich's two emigrations look very like different versions of the same story.

Mr. Dupuis goes on to inform us, that in the early part of the 17th century Ashantee was considered a powerful little monarchy, and, in conjunction with its allies, could

probably send 60,000 men into the field. It had already obtained a kind of influential control over the neighbouring states of Akim, Assin, Quahou, and Akeyah; and the people had acquired a high renown for their military qualities.

At this time, however, the territory of the Ashantees appears to have been confined to the comparatively small inland district mentioned above, lying in the northern part of their present dominions. Dupuis indeed says that they were unsettled in their habitations, though firm and compact as a nation. The first war by which they are recorded to have secured any considerable increase of dominion was that which resulted in the conquest of the neighbouring kingdom of Dinkira. Dupuis says that this conquest happened, according to the Moslem records, in the year of the Hejira 1132, that is, A.D. 1719; and he quotes, in support of this account, the authority of Bosman, the Dutch governor of Elmina, who wrote, he remarks, in 1721, and who states that it had taken place but a few months previous. But Bosman, the second edition of an English translation of whose book appeared in London in 1721, appears to have written the letters of which it consists in the year 1701. In the first of them, he acknowledges the receipt of a letter from his correspondent in Europe, dated 1st September, 1700. His account of Dinkira and of its conquest by the king of Ashantee, or, as he writes the name, Asiante, is in the sixth letter. He describes Dinkira as lying so far inland that it often took five days to go to it from Elmina, and ten from Axim (a fort near the mouth of the Ancobra river);—'not,' he adds, however, 'so much on account of its real distance from either place, as because of the badness of the roads.' The kingdom of Dinkira, which had formerly been of small extent, had, he states, eventually become so powerful, as to have gained the respect of all the neighbouring nations, with the exception only of Asiante and Akim, both of which were still superior to it in strength and resources. Dinkira, however, which held in subjection the three adjoining districts of Wassa, Encasse, and Juffer, was the chief source from which the supply of gold was obtained. 'But a few months past,' continues the writer, 'it was so entirely destroyed, that it lies at present desolate and waste.' An outrage offered by Bosiante, the king of Dinkira, to one of the wives of Zay, the king of Asiante, made him determine to march against his enemy. Bosiante in the mean time died, but this produced no change in the resolution of the king of Ashantee. 'About the beginning of this year,' continues Bosman, 'being completely ready, he came with a terrible army into the field; and engaging the Dinkirans, who expected him, he beat them; but fighting them a second time, he entirely defeated them. The negroes report, that in these two battles above a hundred thousand men were killed; of the negroes of Akim only, who came to the assistance of the Dinkirans, there were about thirty thousand killed.' He intimates his belief, however, that these numbers must be greatly exaggerated. The plunder consequent upon this victory occupied the Ashantees fifteen days; and the booty collected by the king was said to amount to several thousand marks of gold. Dupuis says that the war with Dinkira is still remembered among the Ashantees. After the great battle, the body of King Bosiante was disinterred by order of the avenging victor; the flesh was given to be devoured by serpents, the skull and thigh bones were preserved as trophies. These relics still remain at the court of the king of Ashantee, and are exhibited on certain holidays for popular insult.

The conqueror of Dinkira, who is called Zay by Bosman, is named Sai Tootoo by Bowdich, and Sai Tooto by Dupuis. Zay, or Sai, or Sai, appears in fact to be the general title of the Ashantee kings. According to Bowdich, Sai Tooto was the conductor of what he calls the later emigration of the Ashantees, and the founder of Coomassie, the capital of the empire. Dupuis denies that he built the town, but allows that he greatly increased its size, and transferred thither the seat of the government, which had previously been sometimes at Kikiwhary, north of Coomassie, and sometimes at Begua, to the south of it. The conquest of Dinkira gave so great an accession of territory and power to the Ashantee state, and so completely altered its relations to surrounding powers, that Sai Tooto, upon whom has been bestowed the epithet the Great, may almost be considered as the founder of the present empire. The history of the country before his time is acknowledged to be legendary and

obscure. He is said to have been the first king by whom the Moslems, or Mohammedan inhabitants, were reduced to the same state of subjection with the heathen negroes, and compelled to serve in his armies. It was in his reign also, that a commercial intercourse with the Dutch settlements on the coast first introduced the Ashantees to an acquaintance with white men. Besides his conquest of Dinkira, he carried his arms into the heart of several other of the neighbouring states. He reduced the king of Gaman to the condition of a tributary; entirely subdued the districts of Tofal, Quahou, and another large extent of country beyond the Tando river, to the west of Coomassie; reduced the government of Akim to partial subjection, and ravaged Assin. 'In short,' concludes Mr. Dupuis, 'he created an empire, including tributaries and allies, which was chiefly of a feudal complexion, by the union of all those kingdoms and principalities between the 6th and 9th degrees of N. latitude, and between the 4th degree of longitude west from the meridian of London, and the river Volta. The auxiliary kingdom of Banna was the right arm of Ashantee in those days, and still is.' The empire of Ashantee, however, was still separated from the coast by a tract of forty or fifty miles in breadth, occupied by the perfectly independent states of Aowin, Amanaha, Ahanta, Wossa, Fantee, Inkran, Aquapim, Aquambo, &c. Akim alone had drawn upon itself the resentment of Sai Tooto by its interference on the side of the Dinkirans, and had been compelled to avert the consequences by certain submissions and other sacrifices. It was while engaged in quelling a revolt of this power that Sai Tooto was killed, along with many of his principal nobility, in the year 1731.

He was succeeded by his brother Sai Apoko, in the course of whose reign both Akim and Assin were entirely reduced, and along with Gaman, Bouromy, and Yobati, incorporated as integral parts of the empire. After suppressing a formidable rebellion which suddenly arose in the heart of his kingdom, this sovereign died in 1742. His successor was Sai Akwasy, who after a reign made memorable by a most disastrous campaign with the powerful neighbouring state of Dahomey, lost his life in 1752, from a wound which he received in a war with Banna. His nephew, Sai Kodjoh, then mounted the throne, and reigned till 1781. During his time, a rebellion of several of the recently subjugated provinces brought the empire to the brink of dissolution; but it was eventually quelled, and the influence, if not the actual dominion, of Ashantee, even extended towards the south-west, or in the direction of what is called the Ivory Coast. The reign of the next prince, Sai Quamina, was ushered in by a revolt of Assin, Akim, and Aquapim, which was, however, soon suppressed. But after some years, the leading Ashantee chiefs combined and deposed their sovereign, who had rendered himself obnoxious by a scarcely concealed preference for the Moslem creed, which it was believed he wished to establish as the national religion. This event took place in 1797. The brother of the deposed king was elevated to the vacant throne, under the title of Sai Apoko the Second. He reigned till the year 1800, when he was succeeded by his brother, Sai Tooto Quamina, then a boy of seventeen years of age, the same by whom the throne was still filled when Mr. Bowdich and Mr. Dupuis were in the country.

With the exception, perhaps, of that of Sai Tooto the Great, the reign of Sai Quamina has been by far the most important in the annals of Ashantee. Only a few months after his accession, the young king gave proof of his military talents, by conducting a campaign against the united forces of Ghofan and Ghobago, and defeating them in a decisive battle, in which, it is said, they lost not less than 100,000 men in killed and prisoners. But this must surely be an exaggeration. A considerable accession of territory, and a period of tranquillity which lasted for five years, followed this success. The circumstances out of which new hostilities arose, eventually led also to the intercourse between Ashantee and England, which forms to us the most interesting part of the history of that African nation.

It was in 1807, that an Ashantee army first reached the coast where the European forts are. Down to this time, from the mention of the Ashantees by Bosman early in the preceding century, they do not appear to have been visited by any person from Europe, and their very name had become almost forgotten. Mr. Meredith, who was then second officer in the English fort at Annamaboe, has, in his *Account of the Gold Coast*, given an ample detail of the events which introduced them to the acquaintance

of our countrymen, and corrections or explanations of some points in his narrative may be found in the work of Mr. Dupuis, pp. 250-264. The repose from warlike operations which Ashantee had enjoyed from 1801, was broken in 1806 by a revolt of two of the tributary princes of Assin, who were joined by the Fantees, a nation occupying the tract along the coast on which the forts of Cape Coast Castle and Annamaboe are situated. The Fantees seem to have felt that their independence was endangered by the growing power of the Ashantees; and there is some reason to suspect that the English authorities, ill informed of the relative strength and military skill of the two parties, encouraged a revolution, by which they hoped to prevent the further encroachments of the Ashantees. But the Fantees, though able to bring a numerous army of fighting men into the field, were no match for the Ashantees either in bravery or in the art of war. They were beaten by their enemy in every encounter, and in May 1807, the king of Ashantee had established himself and his army at Abrah, not more than fifteen or twenty miles from the sea. He soon after attacked and made himself master of the Dutch stations of Cormantine and Fort Amsterdam. It was now thought prudent by Mr. White, the governor of Annamaboe, to despatch a flag of truce to the negro monarch, with a request to be informed what object he had in view in coming to the coast. Sai Quamina, who, Mr. Dupuis says, was fully persuaded that this proceeding was merely an expedient to gain time, and besides, was quite aware of the encouragement and promises of assistance which his enemies had received from the English authorities, returned the haughty answer, that the governor should be told what his designs were when he should send him twenty barrels of powder and a hundred muskets. In another week, Aga, a town within a mile of Annamaboe, fell into the hands of the invaders. On the 15th of June, the people of Annamaboe went out in great force to attack the enemy, and the result was, the retreat of the latter, but in excellent order, after a short contest. But on the following day the enemy advanced upon the town, and soon carried every thing before them. Mr. Dupuis states, on the information of the king himself, that it was no part of his plan to attack the castle—that he made no attempt upon that building till the guns had been turned against him, and that even then he did not wish to carry matters to extremity against the whites. That the English, from the first, took the part of the townspeople, not only receiving the old men, women, and children within the fort, but employing all its force to repel the assailants, is acknowledged on all hands. Indeed, in the state to which things had by this time been brought, they could not have acted otherwise. The result, however, proved most disastrous both to the Fantees and their European protectors. The contest lasted from eleven in the morning till six in the afternoon, and in that time it is computed by Mr. Meredith that fully 8000 of the inhabitants of Annamaboe perished. About 2000 more escaped by flight. Of the 15,000 souls, of which the population of the place had consisted, only about 5000 remained at the close of the attack, including about 2000 women, children, and old men, who had found refuge within the English fort. Even of these, many had been destroyed by the shot which fell among them in the open court where they were placed. The garrison itself suffered severely, and was reduced to the utmost extremity. It consisted only of the governor, Mr. Meredith, three other officers, four free mulattoes, and twenty other men of all descriptions. Two men having been killed, and the governor, an officer, and four others of the men, having been wounded early in the contest, the force that could be depended upon was, about noon, reduced to eight individuals, including officers. But about six o'clock the enemy retired, and next day no attempt was made to renew the attack. Its renewal, according to Mr. Dupuis, was only prevented by the arrival in the Ashantee camp of a flag of truce from Governor White. This intimation of a wish for the cessation of hostilities was received with the warmest welcome, both by the negro monarch and his soldiery. That circumstance, which is stated by Mr. Meredith as well as by Mr. Dupuis, is of considerable importance in enabling us to form a judgment as to the original disposition of the Ashantee king towards the whites. These negotiations produced two amicable interviews between Sai Quamina and Colonel Torranne, the governor of Cape Coast Castle, in which every thing was speedily arranged, and the invading army took its departure from the coast on the

1st of July. 'The treaty of peace,' Mr. Dupuis asserts, 'was a formal and a solemn acknowledgment on the part of the governor,—that, by right of conquest, Fantee, including Cape Coast and every other town in the neighbourhood, belonged exclusively to the empire of Ashantee, with the reservation of a judicial authority to the (African) Company over such towns as stood in the vicinity of any of the castles.' It is further alleged, that another demand of the king's was so far acceded to, that some of the inhabitants of Annamaboe, who had availed themselves of the protection of the fort, were given up to be sold into slavery. It is certain that the two Assin princes, whose insurrection had occasioned the war, were, the day before his first interview with the king, ordered by Colonel Torranne, to be seized and sent as a propitiatory present to the victor, whose friendship he was now so anxious to secure. One of them made his escape, but the other was secured. Mr. Meredith is silent as to his fate, presuming, probably, that no reader could entertain any doubt about it. Mr. Dupuis states that he was sacrificed after having been subjected to the most cruel tortures, and that his head is at this day the decoration of the king's death horn.

As might have been expected, the Ashantee monarch did not fail to avail himself, on subsequent occasions, of the road to the coast which he had thus opened by his sword. He repeatedly returned to inflict further chastisement on the Fantees, restless under their new yoke, and constantly attempting to evade the payment of the tribute. Whether they were encouraged or not by the English authorities in these attempts may be matter of doubt. But in 1816 the English again drew upon themselves the resentment of the invader by interfering for the protection of the Fantees; and the Fort of Cape Coast Castle was in consequence subjected to a long and distressing blockade. The besiegers were only at last induced to withdraw their forces by liberal presents. The governor had to pay, in fact, a large sum in gold, which was claimed as the arrears of tribute due from the Fantees. This led to an attempt the following year, on the part of the African Company, to establish amicable relations with the powerful monarch of the Ashantees. An embassy proceeded to Coomassie, the capital of Ashantee, under the conduct of Mr. James, the governor of the fort of Accra, assisted by Messrs. Bowdich and Hutchison, writers, and Mr. Tedlie, an assistant surgeon, in the employment of the company. It is this mission of which Mr. Bowdich has written an account. The party left Cape Coast Castle on the 22d of April, and reached Coomassie on the 19th of the following month. Their reception was in the highest degree favourable; although it was evident from the first, that they would have a very formidable opposition to encounter from the Moors who were established in the city, and whose object naturally was to retain that monopoly of the commerce of the country which they had till now enjoyed. At one of their first interviews, however, the resentment of the king was suddenly excited by something that passed, which led him to infer that his dignity and rightful claims to the sovereignty of the Fantee territory had not been sufficiently respected by the English governor-in-chief on a particular occasion. In meeting this unexpected outbreak, it was conceived by the other members of the mission that Mr. James did not evince the intelligence or discretion which might have been expected from him in the circumstances; and Mr. Bowdich, on the instant, resorted to the extraordinary step of superseding his chief, and taking the conduct of the mission on himself. A speech which he made appeased the king's anger for the moment. His representations also, seconded by his two colleagues, induced the governor of Cape Coast Castle to order Mr. James home, and to leave in his hands the future management of the negotiation. On the 7th of September, accordingly, a definitive treaty was at last signed by Mr. Bowdich, 'in the name of the governor and council at Cape Coast Castle, and on behalf of the British Government' on the one part, and, according to his account, by both Sai Tooto Quamina, king of Ashantee, and Boitinnee Quama, king of Dwabin and its dependencies, on the other. But Mr. Dupuis assures us that there is no such personage as the last-mentioned Dwabin, or more properly Juabin, being merely a town in the vicinity of Coomassie, the governor of which never enjoyed the title of king. When, on Mr. Bowdich's authority, he happened to mention the king of Dwabin, the Ashantee monarch heard him with the utmost astonishment. He asserts that

the governor of Juabin signed the treaty merely as an attesting witness. On the other hand, in the translation of the document given by Mr. Bowdich, the two kings are mentioned together in every paragraph. Mr. Dupuis publishes another version, made from the original in his own possession, in which the party contracting with the representative of the Company, appears to be throughout only the king of Ashantee. The principal articles of the agreement were, that there should be perpetual peace between the British and the Ashantees, and also between the latter and all African nations residing under the protection of the Company's forts; that neither party should be considered to have any claim upon the other; that complaints of any injuries sustained should be made by the king of Ashantee, in the first instance, to the governor of Cape Coast Castle; that a British officer should be permitted to reside constantly at the capital of Ashantee, the king engaging to do every thing in his power to promote a commercial intercourse between his subjects and the English settlements; and finally, that certain of the king's children should be committed to the care of the governor-in-chief for education at Cape Coast Castle. A few days after the signing of this treaty, Mr. Bowdich and Mr. Tedlie set out on their return to Cape Coast Castle, and Mr. Hutchison remained at Coomassie as resident representative of the Company.

In the end of 1818, or the beginning of the following year, Mr. Hutchison was recalled by Mr. Smith, the governor of Cape Coast Castle, to fill an office in that fort. But in the meantime Mr. Joseph Dupuis had received from his Majesty the appointment of consul at Coomassie, and had already reached the African coast on his way to that capital. On arriving at Cape Coast Castle he found the aspect of African politics altogether different from what he had been led to expect. The king of Ashantee had set out on an expedition to put down some resistance to his authority in Gaman; and the result of the campaign was the incorporation of that tributary state as one of the provinces of the empire. At the commencement of the war the success of the Ashantees was by many considered very doubtful; and reports were even brought to the coast that the king's army had sustained a great defeat. Mr. Dupuis states that this delusive intelligence was eagerly listened to, both by the Fantees and the authorities at the English forts, who were eager to shake off the Ashantee yoke. The inhabitants of the town of Cape Coast Castle even proceeded to fortify their settlement by the erection of a wall, certainly with the connivance of the English, if not with their direct encouragement and assistance. When the king of Ashantee heard of these proceedings, he immediately gave orders that all intercourse should be suspended between his subjects and the English. Meanwhile the agents of the Company put every obstacle in the way of Mr. Dupuis proceeding to Coomassie; and partly from these difficulties, and partly from repeated attacks of illness, he was detained for more than a year at Cape Coast Castle. At length, however, negotiations having been opened by the arrival at the port of a mission from the king of Ashantee demanding explanation and satisfaction, he set out for Coomassie on the 9th of February, 1820, and reached that capital on the 28th of the same month. The next day he was admitted to an audience of the king, and met with the most gracious reception. For the history of the negotiations which followed we must refer to the account published by Mr. Dupuis. A definitive treaty was at last signed on the 23d of March, by which the king of Ashantee engaged that he would, with all his power and influence, support, aid, and protect, the British interests in that country; and would, on all occasions, march his armies to any part of the country where the interests of Great Britain might require their assistance. He also relinquished the claims he had made upon the governor of Cape Coast Castle, for compensation on account of the alleged violation of the former treaty; and agreed to an oblivion of all differences both with the authorities there, and with all his Britannic Majesty's other subjects. The consul, on the other hand, acting in the name of the British government, acknowledged the right of his Majesty to the sovereignty of the Fantee territory; on the express condition, however, that the natives residing under British protection were to be amenable, for any act of aggression with which they might be charged, to the British authorities only. Another important stipulation was, that the path or road between Cape Coast and Ashantee should be kept constantly well cleared; the one half by the

English, the other by the Ashantees. Finally, the king of Ashantee was made to acknowledge, not only that he had himself taken his sacred oath of allegiance and fidelity to the Crown of Great Britain, but that all his principal captains and counsellors had done the same. It can hardly be supposed that the full import of this declaration, according to European notions, can have been understood by the negro sovereign; and it would have been better, if so empty an acknowledgment had formed no part of the treaty.

When Mr. Dupuis soon after returned to Cape Coast Castle, accompanied by several Ashantee chiefs, deputed by their sovereign as his ambassadors to the king of England, he found that the authorities there refused altogether to accede to the terms of this treaty. They rested their objections on the old ground, that the sovereignty of Fantee did not belong of right, as this treaty implied that it did, to the king of Ashantee. In this view they were supported by Sir George Collier, who happened to be there in the Tartar man-of-war, and who refused to convey the ambassadors to England. The first result of this conduct was, the gradual withdrawal of the Ashantee merchants and traders from all dealings with the servants of the Company. Although a body of Ashantee forces, however, had taken and retained possession of the town of Cape Coast, they continued to refrain from any actual hostilities. Meanwhile, in the beginning of the year 1821, the forts which had belonged to the African Company were taken by the English government into its own hands, and soon after, Sir Charles M'Carthy was appointed governor-in-chief of all the British settlements on the western coast of Africa, from the river Gambia to the river Volta inclusive. When the new governor landed at Cape Coast Castle, in the early part of 1822, he found that fort closely blockaded by a strong Ashantee force. After a few months Sir Charles began to organize bands of the Fantees into a sort of militia, and to form alliances with various tribes of that nation, and of others established along the coast. The bulk of the population of the district, however, Mr. Dupuis asserts, remained steady to their allegiance to the king of Ashantee.

Sai Quamina appears to have died in the summer of 1823. His successor commenced his reign by a discreet proclamation of war against the English, whom he accused of the infraction of treaties, treachery, cruelty, &c. Soon after, a negro in the service of the garrison was seized by the Ashantees and put to death. It was now resolved by the English no longer to delay active hostilities. The first operations, conducted by Captain Laing, were crowned with success. In August, the Ashantees were completely defeated at Assecuma, in the Fantee territory, by a force, composed partly of Europeans, and partly of native soldiers, commanded by this officer. Encouraged probably by this victory, in the beginning of the following year, Sir Charles M'Carthy had the temerity to advance into the interior at the head of a small body of troops, having previously divided his entire force into four separate divisions. He was attacked on the 21st of January, near the river Pra or Praa, by the enemy, whose numbers are said to have amounted to 10,000 men. The result was a total defeat of the handful of troops under the governor's immediate command. Sir Charles himself was wounded and taken prisoner, and, with the exception of two, all the officers who were with him, were either killed or captured. This disastrous encounter, however, did not terminate the war. It continued for nearly three years, though with long intervals of cessation from hostilities; and was only brought to a close by a severe action fought near Accra, on the 7th of August, 1826, in which the Ashantees were completely defeated. Soon after this, the king submitted to pay 600 ounces of gold, and to send one of his sons and a nephew to be educated at the Castle, as the conditions of a peace.

By these events, the Ashantees may be considered to have been driven from the tract of country immediately adjacent to the sea; but if they have retained their conquests in other directions, the empire must still be of considerable extent. According to the map published by Mr. Dupuis, it appears to stretch, including Gaman, from about our first meridian to nearly the 5th degree of west longitude, or over a range of country not much short of 300 miles in length. Its extent from south to north, when it reached the sea in the former direction, must have been at least as great.

The state next to Ashantee on the east is that of Danomey, from which it is separated by the river Volta, otherwise named the Aswada. Its western boundary on the

coast, was the river Assinee; but in the interior, the province of Gaman lies in great part beyond even the westernmost branch of that river, there known under the name of the Bara. To the north and north-east of Gaman are the Manding tribes, and the independent Moslem states of Kong and Enkasy.

Both Bowditch and Dupuis have given a mass of details respecting the internal geography of the kingdom, upon many of which, however, very little dependence can be placed. Indeed, Dupuis has enumerated a multitude of errors, some of them of the most serious magnitude, into which his predecessor had fallen. The greater part of the information collected by Dupuis himself, again, was derived merely from the reports of persons with whom he conversed, whose statements, where defective, he patched up in the best way he could by hypothesis and conjecture.

The empire of Ashantee, Dupuis says, was popularly reckoned to be made up of no fewer than forty-seven different states, and this was before the annexation of the kingdom of Gaman. The chief of these have been mentioned in the preceding historical sketch. According to the map of Mr. Dupuis, the following are the maritime provinces, in the order in which they are placed from west to east:—Amanaha, Ahanta, Fantee, Inkran, Aquapim, and Adampy. To the north of Ahanta is Tofal, and to the north of that Wossau. Farther in the interior are, Dinkra, Akim, and Aquambo. Still beyond these are, Ashantee Proper, and Quahou; then Massy and Akeyah; then Ajorah; then Coransah and Bouromy; then Takima and Yobati. To the north of these is placed the kingdom of Banna, which is independent, although usually in close alliance with Ashantee. Beyond Banna are the Moslem states of Ghofan and Ghobago, said to have been subdued by the late king Sai Quamina. Ghobago extends a considerable distance towards the north-east. Finally, to the west of all the abovementioned provinces is the kingdom of Gaman, already stated, with its provinces of Ponin, Safoy, Show, Sumah, and Aowin, as they succeed one another from north to south.

The outline of the coast opposite to Ashantee will be more appropriately described under its common appellation, the GOLD COAST. Its general direction is from east to west, although from Cape Three Points in long. $2^{\circ} 40' W.$, it trends on both sides considerably towards the north. The chief rivers which fall into this part of the Gulf of Guinea, are the Volta, or Aswada, the course of which, for nearly 200 miles before it reaches the sea, is almost due south; but the principal branch appears to rise from a mountainous tract considerably to the westward;—the Pra, or Chamah, one branch of which (the Boosempira) flows from the east, while another passes near Coomassie, the capital, and here receiving the former, descends by a course almost due south to the sea, which it reaches about $2^{\circ} 10' N.$ long, forming the boundary between the Fantee and Ahanta territories; the Ancobre (or Rio de Cobre, that is, in Portuguese, the Serpentine River), on the west side of Ahanta; and finally, the Assinee, formed of the united waters of the Tando and the Bara, which join about $6^{\circ} 10' N.$ lat. The hilly portion of the country is in the east and north-east, in the provinces or states of Aquapim, Akim, Aquambo, and Akeyah; but there are no mountains of any considerable height.

The greater part of the country from the sea-coast, as far as fifty or sixty miles to the north of Coomassie, is still a thick forest, through which travelling is impossible, except along the paths or roads which have been conducted with great labour in different directions from the capital. The city of Coomassie, according to the reckoning of Mr. Dupuis, stands nearly in $6^{\circ} 51' N.$ lat., and in $2^{\circ} 16' W.$ long from Greenwich. Mr. Bowditch has given both a plan and a long description of this barbarian metropolis. It is built, he says, upon the side of a large rocky hill of iron-stone, and is completely surrounded by a half-stagnant stream, or rather marsh, varying from 50 to 100 yards in breadth. The town is an oblong, nearly four miles in circuit, without including a suburb or back town, half a mile distant. Of the principal streets, four are each half a mile long, and from 50 to 100 yards wide. But the streets are merely ranges of fields, bordered with rows of houses. The houses are said to be built in straight lines, and the open spaces between the two rows have each a name. The palace stands in a long and wide street which runs through the centre of the town, and is inclosed by a high wall. The number of

streets in all, as reckoned by Mr. Bowdich, was twenty-seven. The population of the town was estimated by the Ashantees themselves at upwards of 100,000; but this is most probably an exaggeration.

Besides the eight great roads, which, according to Dupuis, lead from Coomassie, there are numerous minor roads, although most of them are merely narrow foot-paths, and are often quite impassable. Most of the towns and villages are on the line of some of the great roads. The inland tracts are greatly superior to those that lead down to the coast, an advantage which they owe both to the longer time they have been in use, and to the nature of the country through which they are cut. From beyond Coomassie down to the coast, as has been already observed, the soil is thickly covered either with lofty trees, or with brushwood and trees intermixed; but many of the parts traversed by the great roads in the upper country are open plains.

It would be quite idle to attempt to form any estimate of the numbers of the Ashantee population. Of the military force of the state, the most moderate account which Mr. Bowdich received was that it exceeded 200,000 men.

The men of Ashantee, according to this author, though very well made, are not so muscular as the Fantees. The women he thought in general handsomer than those of Fantee. Among the higher classes both sexes are remarkable for the cleanliness of their persons; but the lower orders are for the most part very dirty.

The most remarkable among the moral characteristics of the Ashantees are their warlike ferocity and their love of blood. These passions have, as usual, deeply coloured their religious belief and observances. We must refer to the work of Mr. Bowdich for an account of their the logical system, which is throughout a compound of the most absurd follies. The most horrid of the practices by which they express their devotional feelings are those in which they indulge at what are called the Yam and the Adai customs, the former commencing in the early part of September, when the consumption of the yam crop begins, the latter taking place, alternately on a greater and less scale, every three weeks. On all these occasions human blood flows in torrents. The sacrifices are described as exceeding in their sanguinary character even those that take place at the neighbouring court of Dahomey, with the description of which the European public has been longer familiar.

The government of Ashantee appears to be a despotism, partially controlled by an aristocracy, and to a greater extent by the antient customs of the country. But in whatever degree the royal power may be restrained by these opposing forces, it appears to be unlimited in regard to the right to dispose at pleasure of the property, the liberty, and the lives of all classes of the population. The king, however, is said always to consult his great council before entering upon a war or upon any other business of public importance. The diminution of the numbers of the nobility has been for some reigns a policy steadily pursued by the crown; and Mr. Bowdich says that the order had been at last reduced to only four individuals. There is, however, besides the hereditary nobility, a council of captains, whose advice at least is usually asked by the king on important occasions. The law of succession to the throne (and the same rule holds as to the estates of private individuals) is in some respects very singular, the nearest heir being the brother, the next the sister's son, the next the son, and the next the chief vassal or slave. In the Fantee country it is asserted that the slave comes in before the son, who only inherits such property as his mother had possessed independently of her husband.

In Ashantee, besides the negroes, there is a large population of Moslems, that is of Moors professing the Mohammedan faith, who have penetrated thither from the north of Africa. These people, possessed as they are of the art of writing and other acquirements not shared by the negroes, form a very influential body wherever they are established. In former times they appear indeed, as already noticed, to have been left by the government in the enjoyment of almost complete independence. In different parts of the empire they still, according to Mr. Dupuis, 'live in political societies, governed by their respective princes, who are vassals to the king, but who enjoy prerogatives exceeding those of any other class of subjects.' From what is said elsewhere it appears that these princes, or caboreers, are appointed by the king. At Coomassie and many of the other towns, the commerce with distant places is almost entirely

in the hands of the Moslems. The provinces in which they are chiefly found are to the north of Coomassie; and it is stated that wherever they exist in considerable numbers the negro population is much less ferocious, and in general further advanced in civilization. The recently conquered countries of Ghofan and Ghobagho were Moslem states;—that is to say, the government was in the hands of the Moslems.

Mr. Bowdich has written a confused chapter on the Ashantee language, from which very little can be gathered. He says that from Amanaha to the Volta there are six different languages spoken: the Amanahée, Ahanta, Fantee, Affootto, Accra, and Adampee. But the vocabularies which he has printed show that these are merely so many dialects of one language. He describes the Ashantee tongue as more cultivated and refined than the Fantee, Warsaw, &c., and as possessing superior euphony, from its abundance of vowel-sounds and its rejection of aspirates. Oratory is an accomplishment in which the Ashantee chiefs generally excel. The rest of Mr. Bowdich's dissertation is principally occupied with a comparison between the grammatical peculiarities of the Fantee and Accra dialects. All these dialects appear to be characterized by the absence of adverbs, prepositions, and those other disguised forms which occur in older languages. The Ashantee music, of which he gives some specimens, is spoken of in high terms by Mr. Bowdich for its sweetness and animation. Among their instruments are a flute made of a long hollow reed, with three holes; a box called a Sanko, the top of which is covered with an alligator's or antelope's skin, having a bridge raised over it, across which are extended eight strings; immense horns, made of elephants' tusks; and an instrument somewhat like a bagpipe. They have also drums made of the trunks of trees hollowed out; and in their martial concerts the noise is increased by the aid of castanets, gonggongs, flat sticks, rattles, and old brass pans.

Mr. Bowdich has given various drawings of the houses of the Ashantees. The walls are usually formed of stakes and wattle-work, filled up with clay. All have gable ends and ridged roofs, consisting of a frame-work of bamboo, over which is laid a thatch of palm leaves, tied with the runners of trees. Many of them have arcades, and many also are highly ornamented with plaster, paint, carving, and other decorations. The doors are formed of entire pieces of cotton wood; and deals of the same wood, cut out with an adze, are also sometimes, though rarely, used for flooring. There is frequently an upper-story supported on rafters. The windows are described as being of 'open wood-work, carved in fanciful figures and intricate patterns, and painted red;' and the frames as 'frequently cased in gold, about as thick as cartridge paper.' While Mr. Dupuis was at Coomassie, the king commenced the erection of a fort, which, although built only of wood, was to be of great height and strength. It was intended as an imitation of Cape Coast Castle.

The principal manufacture of the Ashantees is that of cotton cloth, which they weave on a loom worked by strings held between the toes, in webs of never more than four inches broad. Silk is sometimes interwoven with the cotton. The cloths which they produce are often of great fineness of texture, and their colouring of the highest brilliancy. They paint their patterns with a fowl's feather; and Mr. Bowdich says, that he has seen a man produce these figures in this manner, with great regularity, as fast as he himself could write. Another of the arts in which they have attained considerable excellence, is the manufacture of earthenware. They also tan leather, and work in iron. Mr. Bowdich says that the sword-blades which they make often evince very fine workmanship; but that they have no idea of making iron from the ore as some of their neighbours farther in the interior do. He describes, however, an ironstone of a dark red colour spotted with grey, from which he says they cast bullets. When lead is scarce, some of their ornaments are described as being made of brass; but we do not find it stated that copper is found in the country. But the art for which they are most famous is that of the fabrication of figures in gold. We must refer, however, to Mr. Bowdich's work for a description of the processes which they employ. Articles formed of gold abound in the houses of all the wealthier inhabitants; and in the king's palace those of most common use are described as being made of this precious material. Mr. Dupuis intimates, however, that the statements of Mr. Bowdich

upon this head, and also the descriptions he has given of the splendour of the Ashantee court in general, are somewhat high coloured.

Gold is found in this country both in mines and in particles washed down by the rains. According to Dupuis, the richest gold mines known to exist in any part of Africa are those in Gaman. Some of the richest of these mines are said to be esteemed sacred, and on that account are not worked. The wealthier inhabitants load their persons with lumps of native gold; some which Dupuis saw, he thinks, must have weighed fully four pounds. In Akim, and some other parts of the empire bordering on the Volta, from which much gold was formerly obtained, the mines are now either exhausted, or at least are no longer worked. There are many rich mines in the small district of Adoom, westward from Cape Coast and about three days' journey from the sea; and during the rainy season, it is said that not fewer than eight or ten thousand slaves are employed in washing for gold dust on the banks of the Bara, in Gaman.

The rainy season in Ashantee may be said to commence with the month of May; but the heaviest rains are from about the middle of September to the end of the following month. In some years, however, there is little or no rain at all during the usual season. Mr. Bowdich has given the variations of the thermometer for nearly a whole year, over which his own observations, and those of his associates, extended. In June it appears to have ranged at Coomassie from 73° to 84°; in July, from 71° to 81°; in August, from 68° to 80½°; in September, from 70° to 82½°; in October, from 70° to 83°; in November, from 69° to 83½°; in December, from 63° to 85°; and in January, from 58° to 86°. In the morning, especially, it is much cooler at Coomassie than at Cape Coast.

The yam is the chief vegetable that is cultivated in Ashantee. It is planted at Christmas, and dug up early in September. But there is also grown a good deal of corn, rice, sugar-cane, and a mucilaginous vegetable called encuma, somewhat resembling asparagus. The plantations are of considerable extent, and very neatly kept. The principal domesticated animals are cows, horses of a small breed, goats, and a species of hairy sheep. Among the wild animals with which the region abounds are lions, elephants, hyenas, wild hogs, deer, antelopes, alligators, and a variety of snakes. Among the birds are vultures, parrots, and several small species of beautiful plumage, which sing melodiously. But all the departments of the natural history of the country are still very imperfectly known.

ASHBORNE (or, as it is written in antient records, ESSEBURNE, ASHBURNE, and ASHBOURNE), a considerable market-town, in a rich valley not far from the east or left bank of the river Dove, which falls into the Trent. Ashborne is 139 miles from London and thirteen from Derby. The population in 1831 was 2246, and the number of houses, including two which were building and twenty-seven uninhabited, was 502.

It is pleasantly situated. High hills shelter it from the cold winds of the north; and to the south-west it looks towards the valley mentioned above, where the Dove winds through some of the richest meadows in the kingdom. The church is in the form of a cross, with a tower rising from the centre, surmounted by a fine spire. The building was probably erected in 1241, as there is a memorial in brass of its dedication to St. Oswald in that year. It is in the early English style, and there are several good door-ways. The walls and buttresses retain the characteristics of this early architecture; but several parts of the church are of later date, and of the decorated English or perpendicular styles. It contains many monuments of the Cokaine and Boothby families, especially a beautiful monument by Banks to the memory of Penelope, daughter of Sir Brooke Boothby, who died in 1791, at the early age of six years. The figure of the child asleep, in white marble, has been much admired. There was formerly a presbyterian meeting-house in Ashborne; and at present there are two places of worship, one for the General or Arminian Baptists, and one for the Wesleyan Methodists; as well as one for the Calvinistic Methodists (or Lady Huntingdon's connexion), in the suburb of Compton, antiently Campdene, which is separated from the town on the south side by the rivulet Henmore, or Schoo.

There is at Ashborne a grammar-school founded by Sir Thomas Cokaine and others in 1585: and a Mr. Spalden, who lived in the beginning of the 18th century, by his will

(dated 1710), founded two elementary schools, one for thirty boys, and the other for the same number of girls. There are several almshouses in the town, which owe their origin to different benevolent individuals, especially to Mr. Spalden above-mentioned; and to Mr. John Cooper, who built at his own charge the Calvinistic methodists' chapel in Compton, and also built and endowed an almshouse adjoining to it.

The market is on Saturday, for corn and provisions. There are no less than eight fairs, all for horses, horned cattle, and sheep: wool is sold at the fair in July, which is considered the smallest fair in the year. Ashborne does not seem to possess any particular manufacture, unless it be of lace: but there are iron and cotton factories in the neighbourhood. The chief trade is in cheese and malt.

The parish is very large, and extends into three hundreds, or wapentakes: viz., Wirksworth wapentake (in which is the town), Appletree hundred, and Morleston and Litchurch hundred. It has three dependent parochial chapels, viz., Alsop-in-the-Dale, Hognaston, and Parwick. The population of the parish, including that of the town (as given above), and of the chapels, was in 1831, 5699, and the whole area was 16,490 acres.* The living is a vicarage, of which the Dean of Lincoln is patron. The rectory of Mapleton is annexed to it. The rectory of Ashborne was granted by William II. (Rufus) to the church of St. Mary in Lincoln, and to the bishop of that see and his successors: but by some arrangement at a remote period, it was attached to the deanery of that see; and is now leased out by the dean. Ashborne is in the archdeaconry of Derby and the diocese of Litchfield and Coventry.

Ashborne was the scene of some contests during the war between Charles I. and the Parliament. In Feb. 1644, the troops of the latter were victorious over the royalists. The young Pretender passed through Ashborne in his retreat from Derby, in 1745. (Lysons's *Magna Britannia*; Rhodes' *Peak Scenery*, &c.)

ASHBURTON (antiently written ASPERTON), a borough town in the hundred of Teignbridge, in Devonshire, on the road from London (by Exeter) to Plymouth: 192 miles from London, 19 from Exeter, and 24 from Plymouth.

The town is situated a short distance eastward from the river Dart, and consists mainly of a long street, through which the London and Plymouth road passes, and of a second street, turning off to the right, through which passes the road across Dartmoor to Tavistock. The houses are neat, and are mostly covered with slate, which abounds in the neighbourhood. A small stream, which turns several mills, runs through the town, and falls into the Dart about two miles lower down, just where the Plymouth road crosses the Dart. The church, dedicated to St. Andrew, is a spacious structure in the form of a cross, in the perpendicular style of Gothic architecture. The tower is ninety feet high, and is surrounded by a small spire. In the chancel are several stalls, as in collegiate churches. Adjoining the church is the antient chapel of St. Lawrence, in which the grammar-school is held, and also the meetings for parliamentary elections and other public business. This chapel was formerly endowed with lands valued in the time of Edward VI. at 10*l.* 15*s.* 8*d.* per annum. Of this amount, ten marks, or 6*l.* 13*s.* 4*d.* went as stipend to the chantry priest, who was to keep a grammar-school; and the remainder to maintain and repair the leaden pipes 'for the conduction of wholesome water for the relief of the infected, when the plague should be at Ashburton, that they might not infect others.' These lands, it is probable, are the parish lands now devoted to the repair of the chapel; the endowment of the grammar-school coming from other sources. The chapel was used for marriages and other occasional parochial duty in the early part of the last century.

Besides the grammar-school, there are some endowments for the instruction of the children of the town, especially one given in 1754 by Lord Middleton and the Hon. John Harris (at that time members for the borough), under which, in 1821, upwards of ninety children received education from two schoolmasters of Ashburton. In 1805, the late Miss Dunning founded a gift of 6*l.* per annum, for the instruction of ten girls in reading, sewing, &c.

The independents, particular baptists, and Wesleyan methodists have meeting-houses in the town.

* In the parochial returns for 1831, the chapels of Hognaston and Parwick are given as distinct from the parish of Ashborne.

The chief manufacture of Ashburton is that of serge, which is made for the East India Company. The market is on Saturday, for corn, provisions, &c. A yarn market, formerly held on Tuesday, under letters patent, granted by Charles II., has been discontinued for many years. There are four fairs, on the first Thursdays in March and June, and the first Tuesdays in August and November*. The March fair is a large cattle fair, and that in November a great sheep fair. The number of houses in the parish of Ashburton was, in 1831, 552, including thirty nine uninhabited, and the population at the same time amounted to 4165.

Ashburton was a parliamentary borough in the time of Edward I., but did not again, except once in the reign of Henry IV., return members till the last parliament of Charles I. in 1640. The right of election was in the inhabitant householders and the holders of burgage tenures; but the boundaries of the borough were not clearly known. The number of voters was estimated at between 300 and 400, but the members were really the nominees of Lord Clinton and Sir Lawrence Palk. By the Reform Bill the number of representatives was reduced from two to one, and the boundary of the parish made the boundary of the borough. The number of houses in the parish, of 10 $\frac{1}{2}$ value and upwards, was estimated in the boundary reports at 342. The returning officer is the portreeve, who is chosen annually at the court leet and baron of the lord of the manor.

The living is a vicarage in the rural deanery of Moreton, the archdeaconry of Totness, and the bishoprick of Exeter; and in the ecclesiastical province of Canterbury. It includes the chapelries of Bickington and Buckland-in-the-Moor. The dean and chapter of Exeter are the patrons.

Ashburton is one of the four towns in which the stannary courts are held. These courts are held before the lord warden or his substitutes, for the administration of justice among the tinners of Devonshire and Cornwall, by virtue of a privilege granted to them to sue and be sued only in their own courts. The other stannary towns are Chagford, Plympton, and Tavistock.

This town was the birth-place of John Dunning, the first Lord Ashburton, and of the late William Gifford, editor of the *Quarterly Review*.—(Lysons's *Magna Britannia*; *Reports of Commissioners of Charities*, &c.)

ASHBURTON, LORD. [See DUNNING.]

ASHBY-DE-LA-ZOUCH (in antient writings called ASCEBI and ESSEBY), a market town in the hundred of West Goscote, in the county of Leicester. It is on the little river Mese, or Mease, a feeder of the Trent, and on the road from London to Burton-upon-Trent; 115 miles from London, and 17 from Leicester, the county town. Its original designation was simply Ashby; the distinctive addition of De la Zouch, it received from the Zouches, who were lords of it.

This town consists chiefly of one street, in which stands a neat market-cross, and was nearly surrounded at one time by three parks, now no longer existing, viz. Prestopark, the great park, and the little park, of which the last was the homestead to the castle. The situation of the town obtained for it from Camden the character of *Villa Amenisima* (a most delightful town). The land around is chiefly pasture.

The church, dedicated to St. Helen, is a handsome and lofty antient structure. It is of stone, and the tower contains six large bells and a set of chimes. The body of the church is well pewed; and the chancel was fitted up with pews for his own family by Francis, Earl of Huntingdon, who died in 1790. On each side of the chancel is a large chapel, projecting considerably beyond the side of the church: that on the north side is converted into a vestry-room, and that on the south side is the burial place of the Hastings' family. In the latter is a sculptured monument of Francis, Earl of Huntingdon, and his countess, who both died in the sixteenth century. In this church there was, in 1804, when Mr. Nichols's History of Leicestershire was published, a singular instrument of punishment called the finger pillory. It consisted of a horizontal beam divided lengthways into two parts; the upper part turned on a hinge at one end, and was fastened by a lock at the other end, after the manner of the stocks. In this machine are different-sized holes for containing the fingers of the disorderly. The beam is supported by two upright posts about three feet high.

In an open pasture on the south side of the town, on a

gentle eminence, stand the ruins of the castle of Ashby. This castle seems to have been of vast extent and very lofty. We can trace out the great hall, kitchen, various chambers of state, the chapel, &c.; wherein are found, in good preservation, rich doorways, chimney-pieces, arms, devices, and other ornamental accompaniments. (See Nichols's *Leicestershire*, vol. iii. p. 612.) It was built by Lord Hastings, a nobleman of great power in the time of Edward IV., and who was beheaded by order of the Duke of Gloucester (afterwards Richard III.), shortly after Edward's death. It was one of the places in which Mary Queen of Scots was confined.

The 'Ivanhoe' baths, erected within the last few years, are supplied from the collieries with water impregnated with muriate of soda, or common salt, to a greater degree than sea water. There are a small theatre, a handsome hotel, and lodging-houses.

There is in Ashby a free school, founded in 1567 by Henry, Earl of Huntingdon; also a school for educating and clothing twenty-six boys, founded in 1669 by Mr. Isaac Dawson, and a small foundation for the instruction of twelve girls. Another charity-school has been lately founded by Alderman Newton, of Leicester.

Woollen and cotton stockings, and hats, seem to be the chief articles of manufacture in Ashby; but the manufacturers suffered materially during the war which followed the first French revolution. The market is on Saturday, and is well supplied. There are four fairs in the year, besides a statute for the hiring of servants on the 22nd September.

Coal and ironstone are worked in the neighbourhood of the town, and there is a canal from the Coventry canal navigation, near Bedworth in Warwickshire, to the neighbourhood of Ashby (see Bradshaw's *Map of Canals*), and a railroad from this canal to the town. The elevation of this canal is 315 feet 5 inches above the base assumed as the general level in Bradshaw's *Map*. It runs for 18 miles direct distance from Bedworth without any lock.

The living is a discharged vicarage with the chapel of Blackfordby, in which the vicar performs service once a fortnight. It is in the deanery of Ackley, archdeaconry of Leicester, and diocese of Lincoln. There are places of worship for Presbyterians, Wesleyan and Calvinistic methodists, and, according to some late accounts, for Independents.

The parish is extensive, and includes the hamlets of Blackfordby and Boothorpe. Kilwardby, and the Calais, which now form parts of the town, were once distinct hamlets. The population was, in 1831, 4727, of whom 327 were in the chapelry of Blackfordby.

Ashby was the native town of the eminent Bishop Hall. In the civil war, in the time of Charles I., Ashby was garrisoned for the king, but evacuated and dismantled by capitulation. (Nichols's *Hist. of Leicestershire*.)

ASHDOD, or ASDOD (*Ἀζωτος*, of the Greeks), is situated on the shores of the Mediterranean, in Palestine, about nine miles N.E. of Ascalon, and ten miles S.S.W. of Jamnia. The mention of this place occurs frequently in the Old Testament; it was one of the five Philistine cities, and, at the division of the promised land, it fell to the lot of the tribe of Judah (Joshua xv.), who, however, appear not to have obtained possession; for we find (1 Samuel v.) that 300 years subsequently the Philistines in their wars with the Jews having captured the ark of the covenant, brought it to Ashdod, and placed it in the temple of their god Dagon, which fell to the earth before it. David probably got possession of Ashdod when he 'took Gath and its towns out of the hand of the Philistines.' (Chron. i. chap. 18.) It was taken by the Assyrians about B.C. 714, but afterwards fell into the hands of the Egyptians, after sustaining, according to Herodotus, a siege and blockade of twenty-nine years in the reign of Psammitichus, during which it must have suffered greatly, for Jeremiah calls it 'the remnant of Ashdod.'

The temple of Dagon was destroyed by Jonathan Maccabæus, and the town burnt during the wars between Alexander Balas and Demetrius. It seems never to have recovered its former splendour, though A. Gabinius, the Roman governor of Syria, ordered it to be rebuilt. By the Romans it was called Azotus, and is also noticed by this name in Strabo and the Acts of the Apostles. Its modern name is Asdoud, a near approach to the antient one; but there are no remains of its former grandeur. It is now, Volney says, famous only for its scorpions. The country

* So Lysons's *Magna Britannia*; the 10th Aug. and 11th Nov. according to others.

around is open, and little cultivated, and the village small. The principal object is a large Turkish khan for travellers, which appears to occupy the site of some ancient building—probably one of the primitive Christian churches, as an altar and cross are still standing, and there is an inscription over the door in some Eastern language. It lies in 31° 45' N. lat., 34° 37' E. long.

The land along this part of the coast is perceptibly gaining on the sea, which is shallow, and deposits in this bend of the coast much of the sand from the mouths of the Nile. (Mangles and Irby. See Steph. Byzant.; and Nehemiah xiii. 23.)

ASHDOWN FOREST, a hilly and woodland district in the northern part of the county of Sussex, in what is usually denominated 'the Weald.' This weald was before the Conquest a vast forest, stretching from Chichester to the border of Kent; and the designation in its widest sense is understood to include all the county north of the South Down hills. Ashdown Forest contains about 18,000 or 20,000 acres. The black sand which covers it is of various depth, and lies upon a thick stratum of soft clay. The chief value of the district is as a rabbit warren. Crowborough Beacon, an eminence at the eastern extremity of the forest, is 804 feet high. The road from London to Lewes, through Maresfield and Uckfield, leads across this waste. (Young's *General View of the Agriculture of Sussex*. See *Ordnance Map*.)

ASHER, one of the twelve tribes of Israel. [See **PALESTINE**.]

ASHES, the remains of any thing burnt, whether of vegetable or animal origin, and to a certain extent of mineral bodies also. First with respect to *Vegetable ashes*:—Woody fibre, termed chemically *lignin*, is composed of oxygen, hydrogen, and carbon: it constitutes nearly the whole of all vegetable matter, and it is almost entirely dissipated when burnt. Two of its elements, by combining with the oxygen with which they were already united, and a fresh portion acquired from the atmosphere, form new compounds; these products it would be foreign to our present purpose minutely to notice, but it may be observed that they consist chiefly of water and carbonic acid gas. The carbon of woody fibre is the element which remains longest unacted upon, and on this circumstance the preparation of charcoal from wood depends. When, however, this carbon has been totally dissipated by the long-continued and combined action of heat and the oxygen of the air, there remains only a small quantity of ashes; these are derived principally, if not entirely, from such substances as the plant takes up from the soil during its growth, and which, though universally met with, are most frequently to be considered rather as accidental than necessary constituents of the vegetable. Ashes vary in composition according to the nature of the plant, the soil in which it grows, and of the manure used upon it. But few, if any, of the constituents of the ashes occur in them in the state in which they existed in the plant; they are mostly the altered results of combustion. But to this part of the subject we shall presently recur.

The substances usually contained in the ashes of land-plants are potash, soda, lime, magnesia, silica, the oxides of iron and of manganese, chlorine, carbonic, sulphuric, and phosphoric acid; alumina occurs but rarely, and sometimes oxide of copper has been met with. The salts derived from the combination of some of these bodies are soluble in water; such are the compounds of potassium and sodium with chlorine, those of the same metals with the carbonic and sulphuric acids, and with silica. Lime, and some of the other bases, combined with the carbonic or phosphoric acid, or with silica, are insoluble in water. Very frequently more than one-half of the ashes of vegetables consists of carbonate of lime.

The quantity of ashes varies, not only according to the soil, age, and aspect of the plant, but also in different parts of the same plant, from one and a half to three and a half per cent. of its weight, after drying in the air. Sometimes the ashes amount to four or five per cent., and in the bark of the oak to six per cent.; the quantity and quality of the ashes also vary in the same kind of wood from the accidental circumstances already noticed. Berthier (*Annales de Chimie et de Physique*, tom. xxxii. p. 240) has given the results of numerous experiments on the ashes of different kinds of wood; from these the following are selected as almost extreme cases of the quantity of ashes obtained from

	Per Cent.	Per Cent.	Per Cent.	
Elder	5	10.6	89.2	{ insoluble
Oak	2½	12	88	{ in water.
do. bark	6	5	95	
Birch	1	16	84	

The soluble saline matter yielded, per cent.,—

	Elder.	Oak.	Oak bark.	Birch
Carbonic acid	27.42	24.0	23.2	17.0
Sulphuric acid	7.53	8.1	6.0	2.3
Muriatic acid	1.80	0.1	0.7	0.2
Silica	1.61	0.2	0.8	1.0
Potash and soda	60.64	67.6	69.3	79.5

The insoluble matter consisted of, per cent.,—

	Elder.	Oak.	Oak bark.	Birch
Carbonic acid	39.8	39.6	38.5	31.0
Phosphoric acid	2.8	0.8		4.3
Silica	2.0	7.8	1.1	5.5
Lime	51.8	54.1	50.1	52.2
Magnesia	2.2	0.6		3.0
Oxide of iron	3.1		0.8	0.5
— manganese	0.6		7.4	3.5
Charcoal, &c.			2.1	
	99.3	99.6	100	100

On considering the constituents of the soluble part of wood-ashes, it will be evident that it must consist of the alkaline sulphates, carbonates, and chlorides; while the insoluble matter is chiefly composed of carbonate of lime, and probably of magnesia, phosphate of lime, and phosphate of iron. Wood-ashes may contain a considerable portion of iron without its being indicated by the colour of its oxide, because it is in the state of phosphate; the manganese appears to exist as an oxide: this is indicated, not only by the greyish tint which it imparts, but also by the smell of chlorine evolved by the action of muriatic acid.

It needs hardly be stated that the incineration of wood is a most important operation; from its ashes are obtained the immense quantities of impure potash, and the carbonate called *pearlash*, imported from America and other countries. [See **POTASSIUM** and its salts.] Although wood-ashes thus yield carbonate of potash, yet there is no reason to suppose that this salt exists in the sap of the plant. On the contrary, in the opinion of Vauquelin, the alkali is there combined with acetic acid; and it is well known that acetate of potash is, by heat and the decomposition of its acid, converted into carbonate. The sap of plants contains also other vegetable acids, as the oxalic, citric, tartaric, malic, &c.; and the salts which these form with potash are decomposed by heat, and yield the carbonate. The sources of the alkalis is a subject which has been much discussed, but there is now no question of their being acquired from the soil, in the same way as the lime and metallic oxides. It is well known that basaltic rocks contain soda, and granite rocks potash; and it has been found that fir trees growing in a soil derived from the disintegration of basalt, contain much more soda and less potash than those which grow in disintegrated granite.

The ashes of land plants yield principally the salts of potash; those of marine plants afford a large quantity of soda salts, and especially the carbonate. There are several varieties of *salsola* and *salicornia* cultivated on the coasts of Spain, which, when full grown, are cut, dried, and burnt in trenches; the resulting ashes are called *barilla*, and are imported in the state of hard, grey, porous masses. The richest *barilla* contains about 40 per cent. of carbonate of soda, mixed with various saline and earthy impurities. It is used for soap-making, and in other manufactures requiring an alkali; but since the duty has been taken off common salt, and on account of the cheapness with which soda is obtained from it, *barilla* is now much less used than formerly.

Kelp is the ash of some varieties of sea-weed, especially of the *fucus saccharinus* and *fucus vesiculosus*. It is prepared in the islands of Scotland, and contains scarcely one-tenth as much carbonate of soda as *barilla* does; the remainder consists principally of chloride and iodide of sodium, sulphate of potash, phosphate of lime, earthy and carbonaceous matter. It is used in the manufacture of crown glass, as well as in that of soap.

It is extremely probable that a portion at least of the carbonate of soda found in the ashes of marine plants results from the double decomposition of common salt by the

potash salts originally existing in them. [See SODIUM and its salts.]

Coal ashes are extremely various both in their appearance and composition. Thus much of the coal of the north of England, under common circumstances, burns to a cinder, which is a mixture of the ashes of the coal, with some carbonaceous matter requiring rather a high temperature to burn it, on account of its being enveloped by incombustible matter. The coal of Somersetshire burns to red ashes, evidently coloured by peroxide of iron; those of the Staffordshire coal are nearly white.

Coal, like wood, consists principally of carbon, oxygen, and hydrogen, and, according to Dr. Thomson, it contains nitrogen also. The carbon generally varies from seventy-five to ninety per cent. The quantity of ashes yielded by different kinds of coal varies considerably; according to Kirwan, Wigan coal contains 1·57 per cent. of ashes; Whitehaven coal 1·7, and Swansea coal 3·33 per cent.: they consist principally of silica and alumina, with small quantities of lime, sometimes magnesia, and also peroxide of iron; but they do not contain either the chlorides, phosphates, or alkaline salts found in wood-ashes.

It may be remarked, that while the ashes produced by some kinds of coal are nearly useless, that form of them which results from the imperfect combustion of the north-country coal burnt in London is very largely and economically employed in brick-making.

Peat ashes have been examined by Klaproth; the peat of Mansfeld yielded 20·5 per cent. of incombustible matter, consisting of silica, alumina, lime, sulphate of lime, and peroxide of iron. MM. Oberlin and Buchner have lately analyzed the ashes of the turf occurring near Strasburgh; 1000 parts of the dried turf yielded 180 of ashes, of a reddish grey colour, mixed with white and reddish gritty particles of an earthy, saline taste, and infusible by the blow-pipe. One hundred parts of these ashes yielded

Common salt, with a little sulphate of lime	19
Carbonate of lime and of magnesia	
Phosphate of magnesia and of alumina	81
Sulphate of lime and oxide of iron	
Alumina and silica	100

The ashes contained neither free nor carbonated alkali, no iodine, nor any sulphuret. (*Journal de Pharmacie*, Avril, 1834.)

With respect to *animal ashes*, we are not aware that the different forms of animal matter have been subjected to incineration. From the following results obtained by Berzelius, in his experiments on the ashes of bones, it is not difficult to anticipate that phosphate of lime would constitute the larger part of the ashes of the animal solids, excepting the fat; he found that ox bones, after the dissipation of the carbonaceous animal matter which they contained, yielded 66·7 per cent. of ashes, composed of

Phosphate of lime, with a little fluoride of calcium	57·35
Carbonate of lime	3·85
Phosphate of magnesia	2·05
Soda, with a very little chloride of sodium	3·45
	66·70

The ashes of human bones contain about four per cent. less of phosphate of lime, and almost 7½ per cent. more of carbonate than ox bones. With the exception perhaps of the phosphate of magnesia, all the above compounds existed as stated in the bone previously to incineration: this circumstance forms a remarkable difference between vegetable and animal ashes.

Animal ashes, termed technically *bone ash*, are sometimes, though with less effect than unburnt bones, employed as a manure; also for the purpose of making assay cupels, and in the preparation of phosphoric acid.

Volcanic ashes only remain to be noticed. Vauquelin examined some ashes from Vesuvius which fell at Naples in 1822; their colour was greyish, they were tasteless, and found to consist of alumina, oxide of iron, muriate of ammonia, sulphate of lime, potash, copper, manganese, lime, and charcoal; the proportions of these, however, were not determined. (*Annales de Chimie et de Physique*, tome xxv. p. 72.) Vauquelin also analyzed the ashes ejected in the same year from *Ætna*; they were of a grey colour, and in fine powder; when heated to redness in contact with the air, they exhaled sulphurous acid, and in a close vessel they yielded sulphur. The following statement shows that the composition of these ashes was very different from those of

Vesuvius ejected in the same year. One hundred parts consisted nearly of—

Silica	28·10
Sulphate of lime	18·
Sulphuret of iron	20·88
Alumina	8·
Lime	2·60
Charcoal	1·
Sulphate of copper and of alumina	21·42
Traces of sulphur, a muriate and moisture	
	100·00

(*Annales de Chimie et de Physique*, tome xxxii. p. 111.)

ASHFORD, a market-town in Kent, on the west side of the Stour, just below the confluence of the two upper branches: it is on the road from London (through Maidstone) to Folkstone, 53 miles from London, 19 from Maidstone, and 14½ from Canterbury. It is called in Doomsday-book both *Estesfort* and *Essetesford*, and in other ancient records *Eashetisford*, taking its name from the *Eashe* or *Eschet*, a now obsolete designation of the west branch of the Stour from its source near Lenham to this place.

The situation of this town is pleasant and healthy, being on a small eminence, with a gentle ascent to it on every side. The houses are well built, and the main street (through which the Folkstone road passes) is of considerable width, and is paved. The market-house is in the centre of it, and the church on the south side. At the east end of the town is a stone bridge of four arches over the river Stour. The market is on Saturday. There is a monthly fair or market for the sale of fat and lean stock, held on the first Tuesday in the month; and there are four other fairs, as far as we can gather from our authorities. Several genteel families reside in the town. The population of the parish in 1831 was 2,809.

Adjoining the church is a grammar-school of some repute, founded in the reign of Charles I. by Sir Norton Knatchbull. The master is still appointed by the Knatchbull family.

The church is in the form of a cross, with a tower rising from the centre, lofty and well-proportioned, and surmounted by four pinnacles. The church is in the perpendicular style, and has some good doorways and windows. Several sumptuous monuments of the Smyth family are in a chapel adjoining the south transept. The tower was erected in the reign of Edward IV. by Sir John Fogge, who also much repaired, if he did not rebuild, the church; and founded a 'college' or choir (consisting of the vicar as master or prebendary, two fit chaplains, and two lay clerks), which appears to have been suppressed before the Reformation. A chantry founded in the time of Edward III. was also suppressed during the progress of the Reformation. The living is a vicarage in the presentation of the dean and chapter of Rochester. There are places of worship for different denominations of dissenters: also two national schools, one for boys and one for girls.

The greater part of the parish constitutes what is termed 'the liberty of the town of Ashford,' and is separated from the jurisdiction of the hundred. It has a constable of its own. The town is governed by a mayor, and has a court of record every three weeks for all actions of debt or damages not exceeding twenty marks (6*l.* 13*s.* 4*d.*).

ASHLAR, rough stones of various sizes. This term is applied to free-stones when they are first taken out of the quarry.

ASHLER, a facing made of squared stones. In countries where stone is scarce and expensive, ashler principally consists of thin slabs of stone used to face the brick and rubble walls of buildings. These slabs are generally from four to six inches thick. Ashler is of several kinds. Plane ashler is so called when the surface of the stone is made quite smooth. All the public buildings of London in which stone is used are more or less faced with plane ashler. When the stone shows on its surface a series of narrow parallel flutings, the work is called tooled ashler. This is principally to be met with in the basements of buildings where the stone is set with flutings running perpendicularly. There is also an ornamental kind of ashler, very common in buildings, produced by slightly cutting into the stones, so as to make a depression, along one, two, or more of the sides of the joints. This kind of ashler is called rusticated ashler. [For a more particular account of rusticated work, see MASONRY.] The Banqueting-hall at Whitehall, Somerset house, the Bank of England, and St. Paul's Cathedral, may

be taken as examples of rusticated ashler in London. an example of rusticated ashler on the north side of the western entrance of St. Paul's Cathedral is given in the cut.

ASHLERING, a term in masonry signifying the act of bedding in mortar the ashler above described. The term is also used in carpentry to signify the short upright pieces of wood placed in the roof of a house to cut off the acute angle between the joists of the floor and the rafters: almost all the garrets in London are built in this way. The annexed cut, representing a section of a garret, shows the ashlering above described.

ASHMOLE, ELIAS, an eminent antiquary and herald, the founder of the museum which still bears his name at Oxford, was the only son of Simon Ashmole, a saddler of Lichfield, by Anne, daughter of Anthony Boyer of Coventry. He was born May 23d, 1617, and was placed at an early age as a chorister in the cathedral of Lichfield. He was afterwards taken into the family of James Paget, Esq., one of the puisne barons of the Exchequer, who had married his mother's sister; under whose roof he studied law, spending his leisure hours in acquiring music and other accomplishments. In 1638 he married Eleanor, daughter of Peter Mainwaring, of Smallwood in Cheshire, and in Michaelmas term the same year he became a solicitor in chancery. In February, 1641, he was sworn an attorney of the Common Pleas. He lost his wife on the 5th of December the same year. The troubles coming on, and being a royalist in principle, he retired from London into Cheshire. In 1645 he became one of the gentlemen of the ordnance in the garrison at Oxford, whence he removed to Worcester, where he was first a commissioner and afterwards receiver and registrar of the excise. He became, soon after, a captain in Lord Ashley's regiment, and comptroller of the ordnance. In the midst of these employments he was far from neglecting his studies, having entered himself of Brasenose College, Oxford, where he applied himself with great vigour to the study of natural philosophy, mathematics, and astronomy, and where his acquaintance with Mr. afterwards Sir George Wharton led him into the absurd mysteries of astrology.

In July, 1646, the king's affairs having grown desperate, after the surrender of Worcester, Mr. Ashmole withdrew again, for a few months, to Cheshire; but coming to London he fell in with Mr. afterwards Sir Jonas Moore, Mr. William Lilly, and Mr. John Booker, esteemed the greatest astrologers of their time, and was by them caressed, instructed, and admitted into their fraternity. In 1647 he went into Berkshire, where he made choice of the village of Englefield for the place of his retirement, at which he studied botany. In 1649 he married his second wife, the Lady Mainwaring (widow of Sir Thomas Mainwaring, Knt. recorder of Reading), whose second son by a former hus-

band, Mr. Humphrey Stafford, made great opposition to the match. The fortune which he obtained with this lady (he was her fourth husband) enabled him to open his house to the most learned and scientific persons of the time. In 1650 he published in 12mo. a treatise written by Dr. Arthur Dee upon the philosopher's stone, under the title of *Fasciculus Chemicus; or, Chymical Collections expressing the Ingress, Progress, and Egress of the secret Hermetick Science, out of the choicest and most famous authors. Whereunto is added, the Arcanum, or grand secret of Hermetick Philosophy. Both made English by James Hassole, Esq.*, in which name, the letters of his own will be found transposed. He, at the same time, addressed himself to an undertaking of greater consequence, a complete collection of the works of such English chemists as had till then remained in manuscript; to which, as well as to an ardent passion for the study of chemistry, he had been excited by one Backhouse, who was reputed an adept, and whom, from his free communication of chemical secrets, Mr. Ashmole, in the fashion of the time, was accustomed to call 'father.' In his diary, April 3d, 1651, he says, 'Mr. William Backhouse, of Swallowfield in com. Berks, caused me to call him father thenceforward.' He likewise employed a part of his time in acquiring certain manual arts, such as engraving seals, casting in sand, and the mystery of a working goldsmith. In 1652, believing that a competent knowledge of Hebrew was necessary for understanding and explaining such authors as had written on the hermetic science, he applied himself to the study of that language, under a rabbi of the name of Solomon Frank. At length toward the close of 1652 his *Theatrum Chymicum Britannicum* appeared, a quarto volume, containing many pieces of our old hermetic philosophers. This work gained him a high reputation, and among other scholars to whom it extended his acquaintance was the celebrated John Selden, with whom he lived in intimate friendship till his death. Ashmole's marriage with the Lady Mainwaring, exclusive of mere family opposition, involved him in several law-suits, and at last in one in Chancery with the lady herself. October 8th, 1657, he says, 'The cause between me and my wife was heard, where Mr. Serjeant Maynard observed to the court that there were 800 sheets of depositions on my wife's part, and not one word proved against me of using her ill, nor ever giving her a bad or provoking word.'

Ashmole now devoted himself to the study of antiquity and records. This recommended him to Mr. afterwards Sir William Dugdale, whom he accompanied about this time, when making his survey of the Fens. Ashmole's relish for chemistry had abated, and he gave up his intention of extending his *Theatrum Chymicum* to several volumes. In 1658, however, he published a treatise on the philosopher's stone, entitled *The Way to Bliss; in three books*: 4to.; a work, in which he took leave of his friends the astrologers and alchemists with a good grace.

In the spring of 1658 Ashmole applied himself to the collecting of materials for a *History of the Order of the Garter*, the publication of which will be more particularly noticed hereafter. In this year also he went to Oxford, where he made a catalogue of the coins which had been given to the Bodleian Library by Archbishop Laud. In 1659 the younger Tradescant and his wife made over to him, by deed of gift, the Museum of curiosities at South Lambeth, which the two Tradescants, father and son, had been long accumulating.

Upon the Restoration, Mr. Ashmole was early introduced to the presence and favour of King Charles II. who, on June 18, 1660, bestowed upon him the place of Windsor herald; and a few days after appointed him to make a description of the royal collection of medals. On the 3d of September that year, he had a warrant signed for the office of commissioner of excise; and was also joined in a commission for an examination of the notorious Hugh Peters, respecting the royal library and medals which had fallen into Peters' hands in 1648.

On November 2, 1660, he was called to the bar in the Middle Temple hall; and in January, 1661, admitted F.R.S. Soon after this time, he had several new preferments bestowed upon him, and amongst them, by warrant, February 9, 1661, the secretaryship of Surinam. On the 17th of February, 1665, Sir Edward Byshe sealed his deputation for visiting Berkshire, which visitation he began on the 11th of March following. June 9, 1668, he was appointed accountant-general and country accountant in the

excise. His second wife, Lady Mainwaring, dying at the beginning of April this year, Ashmole paid his addresses with little delay to Elizabeth, the daughter of his good friend Sir William Dugdale, and was married in Lincoln's Inn chapel on the 3d of November following, by Dr. Lloyd, afterwards bishop of Worcester; and on the 19th of July, 1669, he received the degree of M.D. from the University of Oxford by diploma. He was now courted and esteemed by the greatest persons in the kingdom; and having finished his labours upon the History of the Order of the Garter, presented that work to the king, May 8, 1672, who, as a mark of approbation for his toil and research, presented him with a privy seal for 400*l*. In 1675 he resigned his office of Windsor herald; and in 1677, on Sir Edward Walker's death, might have been made garter king of arms, but waived the appointment in favour of his father-in-law, Sir William Dugdale. At the close of 1677 he was proposed to represent the city of Lichfield in parliament, but finding himself insufficiently supported, withdrew his pretensions. On the 26th of January, 1679, a fire broke out in the Middle Temple, in a set of chambers next to those in which Mr. Ashmole resided, by which he lost the greater part of his library, a cabinet of 9000 antient and modern coins, and a great collection of seals, charters, and other antiquities: his manuscripts, however, and his gold medals, were fortunately preserved, by being in the house which had been Tradescant's at Lambeth. Dr. Plot gave an account of this loss to Anthony à Wood, who printed it in his *Athenæ Oxonienses*.

In 1682, the University of Oxford having finished a building as a repository for curiosities near the theatre, Ashmole (according to a proposition made to them before it was begun) sent thither the collection of rarities which he had received from the Tradescants, together with such additions as he had made to them; to which he afterwards added the donation of his manuscripts and library. This is still called the Ashmolean Museum.

In the beginning of 1685 Ashmole was again invited to represent the corporation of Lichfield in parliament, but upon King James intimating to him, by Lord Dartmouth, that he would take it kindly if he would resign his interest to Mr. Lawson, he waited upon his Majesty and told him that he was all obedience. In 1696, on the death of his father-in-law, Sir William Dugdale, he declined a second time the office of garter, which he would have obtained for his brother-in-law, John Dugdale, but was unsuccessful. He however procured for him the place of norroy king of arms. This was one of the last public acts of Ashmole's life; the remainder of it was spent in an honourable retirement to the day of his death, May 18, 1692, when he was in the seventy-sixth year of his age. His body was interred at Lambeth, and a black marble slab laid upon his grave with a Latin inscription.

Besides the works already noticed, which were published during his life, Ashmole left large collections in manuscript:—1. *The Arms, Epitaphs, Fenestral Inscriptions, with the draughts of the Tombs, &c. in all the Churches in Berkshire*, penned in 1666. These were in part published afterwards under the title of *The Antiquities of Berkshire*, three volumes octavo, 1717, 1723, and at Reading in folio, 1736. 2. *Familiæ illustrium Imperatorumque Romanorum Numismata Oxoniæ in Bodleianæ Bibliothecæ archivis descripta et explanata*, finished in 1659, and given by Ashmole to the public library in 1666, a MS. in three volumes folio. 3. *A Description and Explanation of the Coins and Medals belonging to King Charles II.*, a MS. formerly in the king's cabinet. 4. *A brief Ceremonial of the Feast of St. George, held at Whitehall, 1661, with other Papers relating to the Order*. 5. *Remarkable Passages in the year 1660, set down by Mr. Elias Ashmole*. 6. *An Account of the Coronation of our Kings, transcribed from a MS. in the King's private Closet*. 7. *The Proceedings on the day of the Coronation of King Charles II.* 8. *The Arms, Epitaphs, &c. in some churches and houses in Staffordshire*, taken when he accompanied Sir William Dugdale in his visitation. 9. *The Arms, Epitaphs, Inscriptions, &c. in Cheshire, Shropshire, Derbyshire, Nottinghamshire, &c.* taken at the same time. 10. *Answers to the Objections urged against Mr. Ashmole's being made historiographer to the Order of the Garter, A.D. 1662*. 11. *A Translation of John Francis Spina's Book of the Catastrophe of the World, to which is subjoined Ambrose Merlin's Prophecy*. 12. *Collections, Remarks, Notes*

on Books and MSS. 13. *The Diary of his Life*. This work was first published in duodecimo in 1717, under the title of *Memoirs of the Life of the learned antiquary, Elias Ashmole, Esq. drawn up by himself by way of Diary, with an Appendix of Original Letters*. Published by Charles Burman, Esq. Reprinted with Lilly's *History of his Life and Times*, octavo, London, 1774. It is from this diary, abounding in absurd and whimsical memoranda, that the dates and facts in the preceding memoir have been principally taken. (See also Wood's *Athenæ Oxonienses*, Bliss's edition, vol. iv. p. 354. *Biogr. Brit.* by Kippis, vol. i. p. 293.)

ASHOVER, a town in Derbyshire, pleasantly situated in a deep narrow valley, watered by the river Amber; six miles S.W. of Chesterfield, which is the post town, and four from Matlock. It has a small market, frequented during the winter by a few butchers; and two fairs for horned cattle and sheep. As the market is so insignificant and irregular, and is moreover held without charter (as are also the fairs), it is commonly regarded as a village: but Messrs. Lysons (*Magna Britannia*) reckon it among the market-towns. Stocking-weaving and tambour-working give employment to some of the inhabitants.

The church is a Gothic building with a handsome spire, and contains several monuments of the Babington and other families. There is in it a singular antient leaden font, hexagonal in the lower part, but in the upper part circular, and ornamented with rudely executed figures in bas-relief, with flowing drapery, and books in their left hands, standing under circular or Norman arches and separated by slender pillars. There is an endowed school, with a school-house built in 1703; also meeting-houses for the Wesleyan and Primitive Methodists.

The parish of Ashover is extensive, containing 11,290 acres, and has a population of 3179. It is mostly in the hundred of Scarsdale; but the dependent hamlets of Dethwick, Lea, and Holloway, are in the wapentake of Wirksworth. The living is a rectory in the archdeaconry of Derby, and the diocese of Lichfield and Coventry. Dethwick is a chapelry.

There are in the parish considerable lead-mines, especially those of Gregory, Brimstone Dyke, and Overton. Blende, or black jack, an inferior species of zinc ore, is found. Limestone is quarried in great quantity, also coarse grindstones, and whetstones of a finer grain. Ochre is found in some of the mines. Chamomile is cultivated for medicinal purposes in considerable quantities; and valerian, elecampane, and roses (the last for the leaves), to a smaller extent.

There are remains of Eastwood Hall, once the residence of the Reresby family, and a structure of some importance, as appears from its massive masonry. It is a gloomy building, with a modern dwelling attached to its shattered walls, standing at the foot of a high hill, which is covered with huge masses of sandstone rock, and crowned with a pine forest. At Overton in this parish is a house which was the property and occasionally the residence of the late Sir Joseph Banks.

At Lea, in this parish, are the ruins of an antient chapel; also a Unitarian chapel, a cotton mill, and a hat manufactory (Lea Wood).

On the declivity of a hill on Ashover common is a rocking stone twenty-six feet in circumference, called by the country people *Robin Hood's Mark*; and near this a singularly-shaped rock, supposed to have been a rock idol. (Lysons' *Magna Britannia*; Rhodes' *Peak Scenery*; *Beauties of England and Wales*.)

ASHTON-IN-MACKERFIELD, a chapelry in the parish of Winwick, in the hundred of West Derby in Lancashire. It lies on the road between Warrington and Wigan, about two miles and a half N.W. by N. of Newton, one of the boroughs disfranchised by the late Reform Bill. It contained, in 1831, 5912 inhabitants, who are chiefly employed in the cotton and hardware manufactures. Some authorities add that there are collieries and potteries. It is sometimes called *Ashton-in-the-Willows*. The chapelry is in the gift of the rector of Winwick, whose living is one of the richest in the north of England.

Besides the chapel of the Establishment, there are eight places of worship: three belonging to the Catholics, who are numerous; and one each to the Methodists, Independents, Unitarians, Baptists, and Quakers. (Aikin's *Description of the Country round Manchester, &c.*; Carlisle's *Top. Dict. of England, &c.*)

ASHTON-UNDER-LINE, a manufacturing town in the hundred of Salford in Lancashire, on the north bank of the river Tame, which here divides the counties of Lancashire and Cheshire. Duckinfield, which forms a suburb of Ashton across the river, and is united with it by a bridge, is in the latter county. Ashton is $6\frac{1}{2}$ miles east of Manchester, and $186\frac{1}{4}$ miles N.W. by N. of London.

Ashton is a thriving place; and on the whole well laid out and well built. The streets are paved, and the town lighted with gas. The church is large and antient, furnished with a fine peal of ten bells. The architecture has been much altered by subsequent repairs; and the edifice sustained considerable injury from an accidental fire in 1821. Near to this church is an ancient edifice, called '*The Old Hall*,' supposed to have been built in the fifteenth century; and adjacent to it are the remains of a prison, whose appearance indicates still greater antiquity. This prison is known by the name of '*The Dungeons*,' and was used as a place of confinement till a comparatively recent period. A new church, the cost of which was defrayed by a grant from the commissioners for building new churches, has also been erected. It is of Gothic architecture, and has a square embattled tower surmounted by pinnacles. The court-house for the transaction of public affairs is a handsome building, with a theatre and a concert-room over it.

The chief business of Ashton is the cotton manufacture; the increase of which may be judged of by the fact, that in ten years preceding 1831 the mills increased from thirty to seventy. The goods produced are chiefly gingham, muslins, and calicoes. The Manchester and Ashton, Peak Forest, and Huddersfield canals, which connect Ashton with the various manufacturing districts of the north and middle of England, much promote the trade of the town. Hats, woollens, and silks are manufactured here or in the neighbourhood, and coal is dug in the adjacent districts, and indeed in the very outskirts of the town, in considerable quantity. There are more than twenty collieries in the district, which employ upwards of 1000 men.

Ashton was once a borough, but had been disfranchised; and its decay was indicated by the disuse of a market once held by patent granted by Henry VI. The ancient cross is still standing in the market-place. The reviving prosperity of the town has led to an application to parliament for re-establishing a market; and within a few years an act for this purpose has been obtained, as well as one for regulating the police of the town, and for lighting, cleansing, and watching it. Under the Market Act, a site has been provided, and buildings erected, at an expense of above 10,000*l*. The market-day is not yet fixed. The main pipes laid down by the gas company exceed eight miles in length. There are four fairs in the year.

There is an ancient foundation-school; also a national school.

The town of Ashton (including, as it appears, the suburbs or quarters of Boston, Charlestown, Hurst, and some others) had a population in 1831 of 14,673, having increased by more than 5000 persons in the previous ten years.

The chief part of the town and of the parish is on the estate of the Earl of Stamford and Warrington. As lord of the manor he holds a court, at which constables are appointed, and in which questions of disputes, breaches of trust, and rights of tenants, as well as actions of debt under forty shillings, are cognisable. By the late Reform Bill Ashton was made a parliamentary borough, the boundary of which coincides with that laid down in the Local Police Act. It returns one member, and contained in 1831 above six hundred 10*l*. houses. There is a court of requests for the recovery of debts under 5*l*.

The living of Ashton is a valuable rectory, wholly or in part in the gift of the Earl of Stamford and T. Hunt, Esq. The parish is very extensive, comprehending about ten square miles. It is about six miles from N. to S., and four from E. to W. In it are several large manufacturing villages; but except in these and in the town itself, the population is not dense. The parish is divided into four arbitrary divisions, for the purpose of collecting rates, viz. Hartshead, Knottlanes, Audenshaw, and Ashton town; but it is all under one municipal government. The population of the whole amounted in 1831 to 33,597. The spiritual wants of these persons were provided for by five places of worship of the establishment, (viz. the parish church*, three parochial chapels, and one chapel of ease), and twenty-four other places of worship; of

which, nineteen were Methodist, three Baptist, one Independent, and one Johannite. (See *Parliamentary Returns* for 1830.)

The principal villages in the parish are as follows:—Stayleybridge is on the Tame about a mile E. of Ashton. It is not wholly in this parish; for part of it lies across the river, in the parish of Stockport in Cheshire. The two parts are, however, united by an excellent stone bridge, and included in one local act, for the purpose of lighting, &c. The importance of the place is of modern growth, though so far back as in 1795 it consisted of a continuous well-paved street of half a mile, and had in it an episcopal chapel of octagon form. The chief branches of trade were then, and had been for some time, connected with the woollen-cloth manufacture, and consisted of weaving, dyeing, pressing, &c. The population is not ascertained.

Mossley is N.E. of Ashton about two miles and a half. It is connected with Ashton by a new, but not very good road, over a range of high hills. There are scarcely any houses between the places; but in Mossley there are several good ones, and a parochial chapel in the gift of the rector of Ashton. The population in 1831 was about 1500.

Lees is N. by W. of Mossley, and about five miles N. by E. of Ashton. Its situation rather connects it with Oldham (through which its manufactures are carried off to Manchester) than with Ashton, with which it has little communication. Population in 1831 about 3000.

Hooley Hill, the populous part of Audenshaw, is a mile S.W. of Ashton. It has a population of between 2000 and 3000, and is rapidly increasing.

Fairfield, on the road from Manchester to Ashton, is a settlement of the Moravians. It has a chapel, and several good houses.

Near Mossley is Hart's Head Pike, a well-known object, erected in 1758, on the site of a former structure, which is said to have been used as a beacon. The present building is of stone, and is an upright cylinder, surmounted by a cone, whose base nearly covers the upper surface of the cylinder. It commands a delightful view of the surrounding country.

On the W. side of the town, and on the N. side of the road from Manchester, is a large moss, or shaking bog, from the edges of which turf is cut for fuel. At the depth of ten feet, or thereabouts, lies a tolerable loam, which, with improvement, may be rendered good meadow-land. The moss may be crossed at all seasons. Fir trees, fresh and full of turpentine, have been found in it; likewise oak quite sound, and as black as ebony.—(Aikin's *Description of the Country round Manchester*; *Boundary Reports*, &c.)

ASH-WEDNESDAY. This, which is the first day of Lent, had formerly two names; one was *caput jejuniæ*, 'the head of the fast,' the other was *Ash-Wednesday*, so called from the antient ceremony of blessing ashes on that day, with which the priest signed the people on the forehead in the form of a cross, adding this admonition, *Memento, homo, quod cinis es, et in cinerem reverteris*: 'Remember, man, that thou art ashes, and shalt return to ashes.' (See *Festus Anglo-Romana*, p. 19; Moresini Papatus, p. 37; *Festivals* fol. 1511, p. 15.) 'Mannerly to take their ashes devoutly, is among the Roman Catholic customs censured by J. Bale in his *Declaration of Bonner's Articles*, 1554. The ashes used this day in the Church of Rome are said to be made from the palms consecrated on the Palm-Sunday before. In Bishop Bonner's *Injunctions*, A.D. 1555, we read that 'the hallowed ashes given by the priest to the people on Ash-Wednesday are to put the people in remembrance of penance at the beginning of Lent, that their bodies are but earth, dust, and ashes.' The antient discipline of sackcloth and ashes on Ash-Wednesday, is at present supplied in the English established church, by reading publicly on this day the curses denounced against impenitent sinners, when the people are directed to repeat an 'Amen' at the end of each malediction. Compare Wheatley on the *Common Prayer*, 8vo. 1722, p. 227; Brand's *Popular Antiquities*, vol. i. p. 79. Brady, in his *Clavis Calendaria*, says, 'the primitive Christians did not commence their Lent until the Sunday now called the first in Lent. Pope Felix III., in the year 487, first added the four days preceding the 1st Lent Sunday, to complete the number of fasting days to forty, of which it actually consists. Pope Gregory the Great introduced the sprinkling of ashes on the first of the four additional days, which gave it the name of Ash-Wednesday, and the council of Beneventum, in the year 1091, strictly enjoined the observance of the ceremony, which was also

* We presume this must be the building mentioned above as a new church.

lished in England at the Reformation, and a communion service, as above alluded to, substituted in its stead.

ASIA, under which name we at present comprehend all the countries to the east of Europe and northern Africa, was also applied by the Greeks to the countries bordering on the eastern shores of the Mediterranean Sea, and extending thence eastward. Herodotus confesses that he is unable to account for the origin of the name. Homer (*Il.* ii. 461) mentions an *Asian* plain lying near the shores of the *Ægean* Sea between Ephesus and Sardis; and the traditions of the Lydians speak of a king *Asius*. Hence it seems probable that this name was originally applied to a small district on the western coast of Anatolia: in the progress of time, as the countries east of it became known to the Greeks, the name of Asia became co-extensive with their discoveries, till at length it was customary to designate by it one of the great divisions of our globe.

I. Asia as known to the Greeks and Romans.—From the earliest records of European history, the Homeric poems, we learn that an intercourse existed, before the war of Troy, between the inhabitants of Europe and Asia. But as far as we can infer from our authorities, it was more of a hostile than a pacific nature. Commercial exchange seems to have been nearly confined to a few Phœnician vessels which visited the islands of the Archipelago and some ports of Greece, and even with them piracy appears to have been as important an object as commerce. Though the Phœnicians visited the ports of Greece, the inhabitants of that country went only to a few places on the western coast of Asia Minor, and perhaps occasionally to Tyre; their geographical knowledge of Asia was consequently circumscribed within very narrow limits. But confined as their navigation was for a long time, it at last contributed to bring about the settlement of the Greek colonies in Ionia; and this event was followed by another of greater importance in a geographical point of view, namely, the extension of the navigation of these colonies to the countries round the Black Sea, and the exclusion of the Phœnicians from the commerce of this part of the world. The subjection of the Greek colonies in Asia Minor to the kings of Lydia seems not to have injured their commerce, and it doubtless extended their knowledge at least as far as the Halys, the boundary of the kingdom of Cræsus, and perhaps somewhat beyond it.

The progress of geographical knowledge, which hitherto had been very slow, was accelerated by the establishment of the Persian monarchy, B.C. 550. The different states into which till then western Asia had been divided, and which had much impeded the commercial intercourse of its inhabitants, were incorporated into the extensive Persian empire, which comprehended nearly all the countries between the Mediterranean Sea on the west, and the Belur-Dagh on the east, the Caspian on the north, and the mountains which border the valley of the Indus on the west: these countries were inhabited by twenty-nine different nations. The Greek colonies on the coast of Asia Minor, on the overthrow of the Lydian kingdom, had been compelled to submit to the Persian monarch, which circumstance soon led to their intimate acquaintance with Asia beyond the limits of Anatolia. We may judge of the rapid progress made by the Ionian Greeks in their knowledge of Asia, when we find that hardly fifty years after the foundation of the Persian monarchy, Aristagoras, the governor of Miletus, the most commercial and powerful of these colonies, was able to produce at Sparta a copper tablet or map (*Herod.* v. 49)—the first of which we have any distinct record*—on which the countries and military stations between Ionia and Susa were exhibited. About the same time the Persian dominion over all the above-mentioned countries being firmly established, a regular plan of administration was formed by Darius the son of Hystaspes; this king probably caused a geographical and statistical account of the whole empire to be composed, a custom common in Asia at more recent periods, as the *Ayin-i-Akhbari* of the Mogul emperors shows, and one still in use in the Chinese empire. Some such work as this must have existed in Persia, for otherwise we can hardly account for the geographical description of the empire which Herodotus has inserted in his history (*iii.* 89, &c.; *vii.* 61, &c.). The sketch of the Greek historian enables us to form a pretty exact idea of all the countries subject to the Persian monarchs, and even of those which he had not an opportunity of exa-

mining personally. His information about the countries of Asia beyond the boundaries of the Persian empire is scanty, and much less exact: as it was acquired by oral communication with travellers and traders, it is not surprising that it is often incorrect and mixed with fables, though even the latter in many instances are founded on facts.

Before the time when Herodotus wrote, the Persian empire had become stationary. Accordingly we find that the geographical knowledge of the Greeks, for more than a century, did not advance beyond the antient boundaries of that empire. But as the intercourse, both hostile and pacific, between the Greeks and Persians had during that period considerably increased, their knowledge of the different provinces composing the Persian empire was also enlarged. The most valuable information of this kind we find embodied in Xenophon's *Anabasis*, or the *Expedition of the Ten Thousand*. [See ANABASIS.] It was usual for the Persian kings to have Greek physicians about their persons, as we see in the instance of Democedes (*Herod.* iii. 129, &c.), Ctesias, and others. Such men had of course considerable opportunities for acquiring exact information. If the work of Ctesias had come down to us entire, we might have formed a better estimate of the value of his history of Persia, now known to us solely by the extracts of Photius and a few other writers. [See CTESIAS.]

The foundation of this extensive empire had proved advantageous to geography: its destruction also was favourable to its progress. By the conquests of Alexander, the remoter provinces of the Persian monarchy, of which a great part till then had only been known in such general outlines as those given by Herodotus, and by the vague information of individuals, were at once opened to the Greeks, who had been prepared for increasing their geographical information by their education and previous habits. The operations of military expeditions and the observations of military men have always rendered signal services to geography. Alexander attempted to cross the boundaries of the Persian empire on the north and on the south; and though his success was limited in the former quarter, the Greeks began from that time to have some notion of the nomadic tribes beyond the Iaxartes (*Sir-Sihon*), who then, as at present, wandered about in those extensive deserts. But his attempts on the south and east were crowned with success. He crossed the Indus and four of the rivers which traverse the Punjab, and had advanced to no great distance from the banks of the Jumna and the valley of the Ganges, when he was obliged to abandon his design of conquering India, owing to a mutiny of his army. On his return to Persia, he made an important addition to the geographical knowledge of the Greeks by exploring with his army and navy the course and the valley of the lower Indus, and still more by ordering his admiral, Nearchus, to sail along the coast from the Delta of the Indus to the mouth of the Euphrates. [See ALEXANDER.] Besides the geographical knowledge acquired by these military operations, and the successful execution of the orders of the Macedonian conqueror by his admiral, this expedition first gave the Greeks a more exact notion of the great extent of India, of its riches, and the peculiarities of the nations which inhabit this great peninsula. The geographical information acquired during the expeditions of Alexander was incorporated in a map by one of his companions in arms, Dicæarchus, a pupil of Aristotle.

Less satisfactory, though not less important, was the information which resulted more remotely from the conquests of Alexander. The Macedonian king destroyed Tyre, and transferred its commerce to Alexandria, which he founded near the western mouth of the Nile. As the Phœnicians, for perhaps a thousand years and upwards, had carried on a lucrative commerce with the countries to the east and south of the Persian empire, especially with India, by way of the Persian Gulf and the Red Sea, their merchants had frequent opportunities of collecting such information as tended to increase their commercial advantages. Accordingly the Phœnicians had more nautical and geographical knowledge than any other nation of the antient world, and they had embodied it in writings. These were likewise transported to Alexandria, and probably aided the merchants of the new emporium in entering at once into the path of their commercial predecessors, and renewing the intercourse between Europe and India by the Nile and the Red Sea, which had been interrupted by the expeditions of Alexander. Accordingly we find that, soon after the death of the founder of Alexandria, Egyptian vessels from the

* A naximander (see that article) is said by Agathemerus to have made the first maps.

ports of the Red Sea began to visit the shores of Malabar, and to venture as far as Cape Comorin and the island of Ceylon (called Taprobane by the Greeks). But though the geographical information acquired by commerce is often of the most valuable kind, its progress is extremely slow even in our time, and must have been still more so among the ancients on account of the numerous defects of their ship-building, and the backward state of their navigation. Besides, such information is commonly limited to the harbours and shores, and rarely extends to any great distance in the interior. Accordingly we find, that though the commercial intercourse between Alexandria and India was continued without interruption for many centuries, the additional geographical knowledge was scanty and vague; and though many of the harbours of Malabar were annually visited by Egyptian vessels, the information thus obtained concerning Ceylon, the coast of Coromandel, and the country farther to the east, is limited to a few places, and was obviously obtained by the Greeks of Egypt from native navigators, none of them probably having ventured to advance beyond the island of Ceylon and Cape Comorin.

The successors of Alexander, being almost continually engaged in wars among themselves, did not disturb the unsubdued nations which surrounded the Greek empire in Asia, with the exception of Seleucus Nicator, the King of Syria, who made, it is thought, a successful attempt to subdue a part of the valley of the Ganges. This opinion rests on the statement of Pliny (vi. 17). It is, however, certain that he sent an ambassador, Megasthenes, to Sandrocottus, king of the Prasii, to whom a considerable part of Hindustan was subject, and to this individual we owe some further particulars respecting India and its inhabitants. (Strabo, 702, 724, &c.) The Greek empire of Bactria, though its kings remained for many years in possession of the Indian conquests of Alexander, added little or nothing to the previous knowledge of the Greeks concerning that country.

Most of the Greek kingdoms in Asia were destroyed by the Romans, but they did not extend their dominion over all the provinces which once belonged to the Persian monarchy. The extreme eastern boundary of the Roman empire was formed by the Tigris, the Euphrates, and the mountains of Armenia. Their military expeditions being carried on in countries previously known, could add very little to the geographical knowledge of Asia. We ought, however, to make an exception with respect to the Caucasus. In their wars with Mithridates, king of Pontus, the armies of the Romans passed the boundaries of the known world and arrived at Mount Caucasus, with whose extent and situation they became acquainted, though they did not enter the valleys which lie in its bosom. In proceeding farther to the shores of the Caspian Sea, they got information of a commercial road through Bactria, by which the countries on the south of the Caspian Sea carried on an active commerce with India; and soon after another route was discovered, which led over the high table-land of Upper Asia to the Seres or Chinese, probably the road which still passes through the town of Kashghar. Nothing further was added to our geographical knowledge of Asia by the military expeditions of the Romans; but the immense riches which many Roman families had accumulated during the commonwealth, and which still continued to increase under the emperors, created a taste and demand for the exquisite productions of India and eastern Asia, and accordingly we find that not only the lately discovered roads to China and India were much frequented by merchants, but also that the commercial enterprise of Alexandria was so increased, that in the time of Strabo a hundred and twenty vessels were annually sent to the coast of Malabar. This intercourse was considerably facilitated by the discovery of the monsoons in the Indian Sea by Hippalus (Hudson's *Minor Geogr.* vol. i. *Periplus of the Erythrean Sea*): this passage has been sometimes interpreted as if the discovery of the monsoons was made about the time this *Periplus* was written, but there can be no doubt that navigators had availed themselves of the periodical winds long before.

The knowledge which the ancients acquired concerning the geography of Asia is embodied in the systematic works of Strabo, of Pliny, and of Ptolemy of Alexandria, the last of whom raised geography to a science by basing it on astronomical principles. From these writers it is evident, that only those countries into which the Macedonian conqueror had carried his arms were known with some degree of correctness as to their general features, and that beyond them

their knowledge was limited to a few places traversed by commercial roads, and to the harbours. Ptolemy was acquainted with the road leading over the high table-land in the centre of Asia to the Seres, as well as that through Bactria to India. He also had some knowledge of the north-western extremity of the Himalaya range (called by him Imaos or Himaos) and of Cashmere. He was well acquainted with the coasts of Arabia and Persia, and with those of India as far as Cape Comorin. The island of Ceylon, which at that time was the common resort of the eastern and western navigators of the Indian Sea, was also pretty well known to him, though the dimensions assigned to it are very erroneous. In its neighbourhood he states there were found 1378 islets, by which probably the Laccadives and Maldives are meant; and he names Jabadia (Yavadwipa) i. e. 'the barley-island,' as Java is called in Sanscrit on account of its fertility. He is, however, less acquainted with the coast of Coromandel, and still less with the countries to the east of the Bay of Bengal, where the Aurea Chersonesus evidently represents the peninsula of Malacca, on which the port of Zaba was situated, probably in the neighbourhood of Singapore. Then follows the Sinus Magnus or the Gulf of Siam, after traversing which by a voyage of twenty days, the emporium of Cattigara is arrived at, the harbour of the Sinæ or Chinese, a place which must be sought for in the neighbourhood of Canton; and farther to the east with the Thinae Metropolis (probably Canton) he arrives at the extreme boundary of his geographical knowledge on the east side of Asia.

Besides these works, the *Periplus of Nearchus*, and another probably written in the second century, and attributed to Arrian, give a more particular description of the coast of eastern Africa and of Asia. Another *Periplus* likewise, which certainly is the work of Arrian, contains a brief coast description of the Pontus Euxinus (Black Sea). [See ARRIAN.] As to the geography of northern Asia, few additions seem to have been made after the time of Herodotus and Alexander. In some respects there seems to have been a retrograde movement, as the father of history knew the Caspian to be a lake, which Strabo believed to communicate with the northern ocean. Ptolemy in his map restored the Caspian to its true character of an inland sea, but he placed its length from east to west instead of from north to south, as Herodotus had done. [See ARGONAUTS, vol. ii. p. 310; and Pomp. Mela, i. 2.]

II. *Asia as known in the Middle Ages.*—Though the Byzantine empire did not fall before the invasions of the northern barbarians, it was hemmed in on every side by powerful enemies. On its eastern boundaries, the kingdom of the Parthians was replaced by that of the Persians under the dynasty of the Sassanidæ, who, acting with all the vigour of newly-founded governments, stopped the progress of the Roman arms on that side. Consequently, the accession of geographical knowledge concerning Upper Asia was extremely scanty, but some information was obtained of the countries to the north of the Iaxartes, and of some parts of India. For the first we are indebted to an embassy of the Emperor Justinian II., who sent in 569 one of his governors to one of the wandering tribes of the Turks in the steppes on the west and south of the Altai Mountains and about the lake of Saisan, or Zaizang, with the view of inducing them to attack their common enemy, the Persians, without foreboding that the descendants of this very people, after a lapse of nearly nine hundred years, would destroy his own empire and choose Constantinople for their metropolis. Nearly about the same time, an Egyptian merchant, Cosmas, surnamed Indicopleustes, who for a long time had carried on a trade with India and repeatedly visited that country, composed his *Topographia Christiana*, in which he gives some new information respecting Ceylon, called by him Selediva, instead of the ancient name of Taprobane, of the commerce of that island with Tsinitza or China, and of the roads through Upper Asia by which the silk manufactures of this country were brought to Persia and Constantinople.

But the channels of geographical information were soon closed. The fanaticism of the newly-founded religion of Mohammed bore down all resistance, and in a short time Egypt and the Asiatic provinces of the Byzantine empire, except Asia Minor, were subjected to the Arabs and their Caliphs; the kingdom of the Sassanidæ also was incorporated in their widely-extended dominions. The intolerance by which the Mohammedans in the first two centuries of the Hegira (commencing A.D. 622) were distinguished,

interrupted every sort of commercial intercourse with India as well as with Upper Asia, and the distracted condition of the Byzantine empire, and the state of barbarism in which the western nations of Europe were sunk during the earlier part of the middle ages, was such as to deprive them for more than two centuries of any additional knowledge concerning the countries of the East. From the close of the sixth century to the beginning of the Crusades, no new facts were added to European knowledge of Asia.

Circumstances, however, arose which led the Mohammedans of the Caliphate to abate their intolerance and to adopt a more enlightened policy. Science began to be cultivated, arts to flourish, and commerce to be promoted among them. Geography had its full share of the advantages resulting from this favourable change. As every true Mohammedan was bound by his religious tenets to visit at least once in his life the Kaaba of Mecca, travelling became more frequent among the Arabians than it ever has been in any other nation; and as the love of letters increased and became more general, the number of their geographical works, travels, and voyages increased in the same proportion. Many of their works are undoubtedly still unknown, others are still inaccessible to European readers, but some have been translated. The most important are the *Oriental Geography*, translated by W. Ouseley, London, 1800, which was written in the beginning of the tenth century; the *Travels of Ibn Haukal the Arabian*, written about fifty years later; the *Geography of Edrisi* (1153), arranged, like that of Ptolemy of Alexandria, according to climates; the *Geography of Abul-feda* (1345); the *Geography of Ibn el Wardi* (1371); and the *Travels of Ibn Batuta* (1324-1354), translated by Professor Lee of Cambridge, London, 1829. Ibn Batuta was doubtless the greatest traveller that ever lived. He visited Timbuctoo and the Ural Mountains, Adam's Peak in Ceylon, the eastern coast of China, and Tanger in Africa (which was his birth-place), and traversed all the countries between these extreme points.

The Arabs seem also at an early period to have renewed the commercial intercourse with India by the Red Sea and the Gulf of Persia, and to have soon extended their navigation beyond the extreme limits attained by the Greeks of Alexandria. They were prompted to despise the dangers of such a perilous navigation as much by zeal for propagating their creed as by the love of gain, and they succeeded in converting the inhabitants of the Peninsula of Malacca and some of the islands of the Indian Archipelago. There are extant two works on the countries about the seas of China, written, as it is thought, by Ibn Wahab and Abu Seid about the end of the ninth century. The latter composed only a commentary on the writings of the former. Though it is possible that neither of these voyagers reached Canfu (Canton), they collected very interesting information on the southern provinces of China, its productions, and manufactures; some historical facts which they mention respecting an insurrection in these districts in 878 are confirmed by the annals of the Chinese empire, a coincidence which shows the authenticity of these works.

But the Arabs did still more for geography by establishing it as a science on mathematical and astronomical principles, and thus following up the work of Ptolemy. The Calif Al Mamun (813-833) ordered a degree of the meridian to be measured, and this task was executed by the three brothers Ben Shaker in the great plain to the north-east of Damascus, between Palmyra and Racca on the banks of the Euphrates. In subsequent attempts at the projection of maps, the Arabs soon became sensible of the want of actual astronomical observation. This led them to the erection of observatories, and to the compilation of astronomical tables. Two works of this kind still exist: one composed about A.D. 1345, in the observatory built at Maragha, near the lake of Urmia; and the other in 1449 at Samarcand; the data contained in them, especially in the latter collection, formed till lately the principal basis on which our maps of the countries to the south of the Caspian Sea, and to the north of the mountains of Cabul and of the Hindu-kush range, were constructed.

Among the nations of Asia none perhaps has done more to increase the stock of geographical knowledge concerning this great division of the globe than the Chinese. The historical records of their empire prove clearly, that two hundred years before our æra the Chinese were anxious to collect geographical information concerning the extensive provinces and tributary kingdoms of their domi-

nions: and they have continued this work to the present day. Neither opportunities nor inducements were wanting for that purpose. An empire of such magnitude as the Chinese always has been, which frequently comprehended half the surface of Asia, renders the exact knowledge of the condition of its provinces, and of their inhabitants, a matter of necessity to the government. Besides the information thus collected by means of the administration of the different provinces, the emperor was in the habit of sending ambassadors to the tributary princes and nations, and to those who, from time to time, sent presents to the court of the Celestial Empire. These ambassadors were instructed to gather useful information concerning the countries they were sent to, and to include it in their reports of the embassies: the reports were afterwards deposited in the archives of government. From such materials the geographies of the Chinese empire were composed and published in print, the art of printing having come into general use among the Chinese in the tenth century. These works contain very abundant information concerning Tartary, Corea, Tibet, Turkistan, and Bucharia, and even valuable notices on Siberia, Persia, and India, as well as on Siam, Tonkin, Java, Formosa, and Japan. But till very lately this information could not be used by the geographer, the study of the Chinese language not having been attended to by Europeans. The number of those who now study this language is daily increasing, and we may soon hope to get access to these writings, which is the more desirable as most of the countries described in the Chinese works are still inaccessible to our merchants and travellers. The most copious geographical and ethnographical information about the eastern countries of Asia in the middle ages, before the establishment of the Mongol empire, is contained in the historical library of Ma-tu-an-lin, the most learned man of his time, who, in his work entitled *Wen-hian-thung-khao* (Exact Researches of old Monuments), consisting of a hundred volumes, in 348 books, has given an epitome of Chinese literature to A.D. 1207. This great work is characterized by more judgment and accuracy than the similar compilation of Pliny the elder. Nine books are devoted to the geographical description of China, at the different periods of the native dynasties; and twenty-five contain the description of the foreign countries and nations.

Europeans began to renew their acquaintance with the countries of Asia on the shores of the Mediterranean in the eleventh century by pilgrimages, and soon afterwards by the Crusades (1096-1272) undertaken for the delivery of the Holy Sepulchre from the Infidels. The navies of the Italian republics accompanied these expeditions, and the citizens of Pisa, Florence, Genoa, and Venice had thus an opportunity of forming a correct idea of the advantages likely to result from a commercial intercourse with western Asia. Following up these views, they entered into a very lucrative commerce, and brought by their vessels the most valuable products to Europe. The Genoese, in 1261, having got possession of Galata and Pera, suburbs of Constantinople, and with them the exclusive commerce of the Black Sea, extended their commercial speculations to India through the Crimea, Caffa, La Tara (Azof on the Don), Astrakhan, Urgenz (Khiwa), and Tashkend, of which route the interesting work of Balducci Pegoletti, entitled *Libro de' Divisamenti dei Paesi e Misure*, written in 1335, gives some information. Their rivals, the Venetians, had come to an agreement with the sultans of Egypt, by which the direct road to India through the Red Sea was opened to them, and the sudden increase of the wealth of the republic proved that they knew how to profit by these advantages.

Whilst the Italian republics, from mercantile motives, kept to themselves the scanty information which they had acquired by their commercial intercourse with Asia, the western nations of Europe were at once brought into political connexion with those who inhabited the northern and inland parts of this continent. This was brought about by the conquests of Tshengis-khan and his successors. Soon after the death of Tshengis-khan, who had extended his dominion in little more than twenty years (1206-1227) over all the inland countries of Asia from the boundary of Siberia to that of India and Tibet, the Mongols entered Europe across the Volga, subjected Russia, laid prostrate the power of Poland, and gained a victory at the foot of the Riesengebirge, at Liegnitz in Silesia (1245). All Europe trembled; but the barbarians, having got

information of the death of their great Khan, instead of pursuing these advantages, returned to their native country, preserving, however, the dominion over Russia. Then the politics of Pope Innocent IV. and of King Louis IX. of France suggested the plan of directing the power of the great Mongol empire and its warlike army against the Mohammedan princes in western Asia, their implacable enemies; but this object did not seem practicable to the projectors of this plan, unless they could previously convert these barbarians to the Christian faith. For that purpose some friars were sent to the court of the great Khan; John di Plano Carpini in 1246, Father Ascelin, a dominican, in 1248, and William Rubruquis, or Ruysbroeck, in 1254; and though they did not succeed in the main object of their mission, the information which they acquired of the countries through which they passed made the Europeans for the first time acquainted with the immense extent of those regions formerly called by the vague name of Scythia, which from that time obtained the name of Mongolia, or Tartary. Carpini traversed a considerable part of the deserts to the south of the Altai range, and Ruysbroeck advanced even to the then metropolis of the Mongol empire—Karakorum, situated at the conflux of the Tula and Orghon, tributaries of the Selenga, to the south of the lake of Baikal. He gives a curious and very interesting description of that extraordinary town, which was everywhere surrounded like an oasis by extensive deserts. The Mongols, however, continued in their career of conquest in Asia, and at length subjected China to their sway (1275-1279) under the reign of Kublai Khan (1259-1294), the most able of all the successors of Tshengis.

At the court of this monarch the Venetian traveller Marco Polo resided from 1275 to 1292, and as he enjoyed the favour of the emperor in a very eminent degree, and was well acquainted with the most important languages spoken by the people of the country, he was frequently sent on missions to the remotest provinces of the Mongol empire, which were so distant from one another that he was often obliged to travel six months before he arrived at the place of his destination. After traversing, under such favourable circumstances, the Mongol empire in different directions, he was sent as ambassador to the islands of the Indian sea, and had thus an opportunity of becoming acquainted with this part of Asia also. On his return to Europe he passed through the strait of Malacca, remained, on account of the monsoons, five months in Sumatra, visited Ceylon and Malabar, and landed at Ormuz in the Persian Gulf. In all his missions and travels he had been in the habit of keeping a journal, and of entering what appeared to him most worthy of being recorded. On his return to Italy his incredulous countrymen importuned him by unceasing questions, and at length he resolved to make an extract from his journal of the most remarkable objects which he had seen or heard of. This he did in a book entitled *Il Miglione di Messere Marco Polo*, or in Latin, *De magnis Mirabilibus Mundi*; one of the most curious and important works of modern literature, which has been translated into almost all European languages. It very materially influenced the views of Columbus, the discoverer of America, and directed the route of Vasco de Gama, who first went to India by the way of the Cape of Good Hope. The correctness of Marco Polo's information is better known and valued in proportion as, by the study of the Asiatic languages, and by the reports of modern travellers, we become more acquainted with the countries which he described. He has been frequently called the Herodotus of the middle ages, and has doubtless a claim to that title. If the name of a discoverer of Asia were to be assigned to any person, nobody would better deserve it, for he alone added to our geographical knowledge of Asia a much greater amount than what had previously been known by the antients, together with what had been acquired by the travels of Carpini and Ruysbroeck. Besides the information which he gives us concerning Asia, he acquaints us with the eastern coasts of Africa and the island of Madagascar: the latter countries, as well as some parts of Asia, he had not personally visited; but even here his information has proved correct, and shows the care which he used in collecting his facts.

The chief subject of his description is the Mongol empire, which extended over more than one half of Asia, including nearly all the countries of which the antients had either no knowledge at all, or very scanty and confused information. To the north, his knowledge extended to the lake of Baikal,

the Tunguse tribes, who had no cattle but rein-deer (which tribes he calls Mekrit), and the adjacent sea (Mare Oceano); and he informs us of the connexion between the plains of eastern Europe on the Volga and Don, and those of Tartary and Mongolia. Further, he gives a description of China, in which Peking had become the residence of the Mongol emperors, and of Japan, called by him Zipangu, which name is evidently formed of the Japanese Dshi-penkue (the Empire of the Rise of the Sun). Japan he had not visited; but as his protector, the great Kublai Khan, had sent, in 1280 and 1281, some naval expeditions from Khanfu and Zaitun, in the Chinese provinces of Chekiang and Fukian, to attempt the conquest of the Japanese islands, Marco Polo had a good opportunity of collecting information concerning them, though, as he says, they were 1500 miles from the Chinese coast. The countries to the west of China he had visited, especially Tibet; here he got information of Mien, i. e. Pegu, and Bangala, Bengal, in Hindustan, a name never before known in Europe. Kublai Khan had sent, in 1272, an army to conquer these countries. Marco Polo is the first European, as far as we know, who navigated the seas to the east and south of the peninsula beyond the Ganges; and here he mentions the Spice Islands, 7448 in number, as he says, but he did not see them. They are situated in the sea of Cyn, and are mostly inhabited; but they have no commercial intercourse with foreign nations, except the merchants of Ma-Chin, or southern China, who visit them during the monsoons. He next gives some general information of the islands of Sunda and the adjacent groups, which, according to the information he obtained from navigators, consist of 12,700 islands, partly inhabited and partly uninhabited. All these countries and islands were almost entirely unknown before the publication of the travels of Marco Polo. But of the countries previously known to the antients, the information he gave was likewise interesting, and has proved very useful. He treats of Ceylon, Malabar, and Ormuz, which he himself had visited; and of Aden, Socotora, Abascia (i. e. Abyssinia), Zanguebar, and Madagascar, which names were for the first time introduced by him into Europe: these countries had been indicated to him by Arabian navigators. His information concerning these seas served, two centuries later, to direct the course of Vasco de Gama in his first navigation to the shores of India. For he says, 'Departing from the coast of Malabar, a vessel makes, by the assistance of a current, in three months, a thousand miles towards the south-west, and then arrives at Madagascar, and to the still more extensive island farther to the west (i. e. Southern Africa), which are inhabited by black tribes with curly hair, rich in valuable productions, elephants, camelopards, gold, sandal-wood, amber and frequently visited by merchants from Arabia and India.'

After the time of Marco Polo the number of travellers in Asia increased; but as none of them traversed any considerable part of it, they commonly tried to enlive their works by fables or inventions of their own, or by exaggerating the information which they had obtained by intercourse with the natives. Of this description is the information given by the Armenian monk Hayton, in his *Historia Orientalis*, who collected it from the communication of his uncle, king Hayton I. of Armenia, who, having been present at the court of the great Khan Mangu Khan, had some opportunity of collecting geographical facts. Equally worthless are the reports of the Venetian monk Oderico Portenau (1317), and still worse the travels of the English knight John Mandeville (1358); these two travellers seem to vie with one another in exaggerating facts. But later, in the fifteenth century, we find some better information, especially through the Spanish ambassador Gonzalez Clavijo, who in 1406 was sent to the court of the famous Timur at Samarcand; and from the German adventurer John Schiltberger, who served in the armies of Bajazet, the Turkish emperor of Timur, and Shah Rokh, from 1400 till 1427; and especially the Venetian, Josaphat Barbaro, who travelled (1436-1441) in the countries east of the Mediterranean Sea, and carefully collected many remarkable facts. But all these travellers, though they brought back to Europe some useful information, contributed little or nothing to the extension of our knowledge, as to parts which had previously not been known at all, or only very imperfectly. This, however, was effected in a very eminent degree by the discoveries of the Portuguese soon after they had found their way to India round the Cape of Good Hope.

III. Progress of the geographical knowledge of Asia

after the circumnavigation of Africa.—The parts of Asia which had been visited by the Greeks were so far known, as to their boundaries, extent, and principal features, that they could be laid down with a tolerable degree of exactness. This will be evident to any person who examines Ptolemy's map of the extensive region between the Mediterranean, the Caucasus, the Caspian Sea, the Belur Tagh, and the river Indus, though it is also clear that the vague information which this geographer had obtained respecting India betrayed him into very great errors as to that country. The information acquired by the travellers of the middle ages was much less exact. None of them had determined the astronomical position of any place; but as they, and especially Marco Polo, had noticed the immense extent of the countries which they had traversed, a very erroneous idea was formed of their true position on the globe. Thus we find that the German astronomer and geographer, Martin Behaim, who, in 1484 and 1485, accompanied the Portuguese navigator, Diogo Cam, in his voyage of discovery along the coasts of Guinea, and in 1492 made, in his native place, Nürnberg, a terrestrial globe, has placed the Zipangu of Marco Polo, or the present Japan, at no great distance to the west of the islands of Cape Verde. A few years were sufficient to remove this error. But even later geographers, as Sim. Grynæus, Sebastian Münster, and others, in their *Typus Cosmographicus Universalis*, i.e. in their maps of the old and new world, drawn up in the first quarter of the sixteenth century, laid down the same country at a short distance to the west of the Terra di Cuba and Parias, in America, which had been discovered a few years before. It was only by the discoveries of the Portuguese subsequent to the circumnavigation of the Cape of Good Hope, that such errors were removed, and the true position and extent of these countries of eastern Asia ascertained.

Vasco de Gama arrived, in 1498, at Calicut, on the coast of Malabar, and the Portuguese pushed their discoveries in these seas with such activity and zeal that, in the course of less than half a century, they had explored them as far as Japan. Their first efforts to establish a commerce were directed to the coast of Malabar; and, as the Arabs or Moors, who then carried on a very active trade with these countries, tried every means to exclude them from these parts, and to embroil them with the numerous sovereigns among which this coast was divided, they were soon obliged to have recourse to arms, and to enter into alliance with some of the native powers. In a few years they had acquired a complete knowledge of the whole coast, from Cape Comorin to the Bay of Cambay and its rich emporiums, Surat and Broach; and, as early as 1509, they made several settlements on the southern coast of Guzerat as far as Diu, which then had a considerable commerce with Persia and Arabia, and they erected on this coast some fortresses. The following year Alfonso Albuquerque took from the Mohammedan monarch of Deccan the famous town of Goa, which soon became the centre of all the Portuguese dominions in India and the seat of the viceroy and colonial government. The Portuguese now made advantageous treaties with the petty sovereigns along the whole coast of Malabar. But before this time the neighbouring island of Ceylon had been discovered by Almeida in 1506, which was at that epoch of the greatest commercial importance, being a station for the Arabian vessels which went to the Spice Islands for the spices, which, together with the cinnamon which grows in Ceylon, they exported to the harbours in the Persian and Arabian Gulfs, and thence to Europe. In 1517 the Portuguese erected the fortress of Colombo, in Ceylon, and began to exercise a dominion over its petty sovereigns. To secure the monopoly of India, they tried to exclude Arabian vessels from the Indian sea, and succeeded partly by the conquest of Ormuz at the entrance of the Persian Gulf, and by their superiority in naval force.

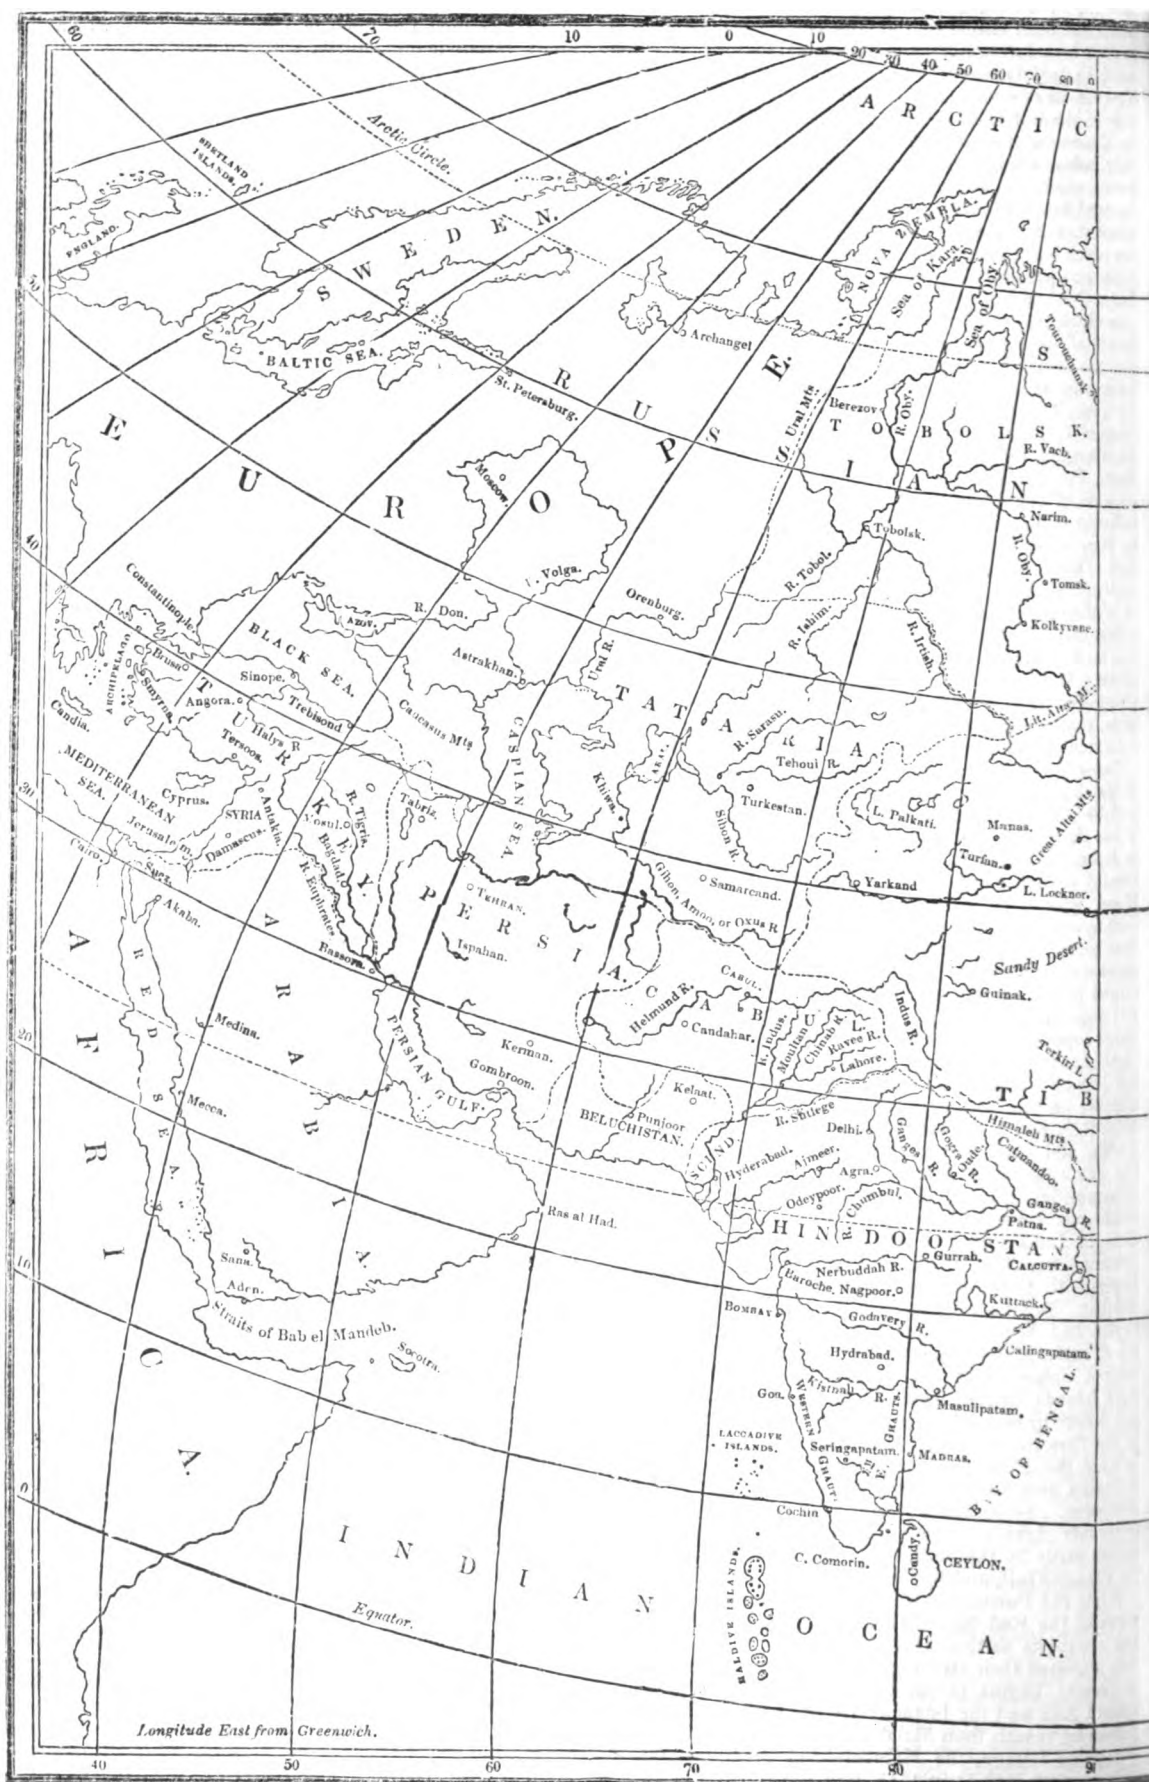

While the Portuguese were struggling to obtain the commerce of the Red Sea, they also extended their discoveries and conquests farther to the east. The town of Malacca soon attracted their attention. It was then what Singapore at present begins to be, the resort of all the nations of eastern Asia and the Islands; its harbour was continually visited by vessels from Malabar, Bengal, Siam, China, the Philippine Islands, the Moluccas, and the Sunda Islands. Albuquerque took it in 1511, and the discoveries and the navigation of the Portuguese were speedily extended in all directions. Now, for the first time, they entered the Gulf of Bengal, and became acquainted with the coasts and har-

bours of Coromandel, Orissa, and Bengal. John de Silveira in 1518 visited the town of Chittagong, from which the finest cotton manufactures, silk, ginger, indigo, and sugar, were exported. The coasts of the peninsula beyond the Ganges were likewise explored, and some knowledge was obtained of the kingdoms of Aracan, Pegu, Ava, Siam, Camboja, and Cochin China. But the Portuguese directed their attention chiefly to the islands. From Sumatra, which was divided into upwards of twenty kingdoms, they obtained gold, tin, pepper, sandal-wood, camphor, &c. They visited Java in 1513, and Borneo in 1523. The innumerable islands scattered over the Indian seas, which thus became known, led the Portuguese historian De Barros to set them down as a separate great division of the globe, calling it by the significant name of Polynesia. The extreme boundary of the Portuguese discoveries was the large island which they called New Guinea, on account of the resemblance of its inhabitants, the Papuas, to the negroes of Guinea on the African coast. In this navigation they successively became acquainted with Celebes, Sulu, Magindanao, Luzon, or Manila, and the Moluccas or Spice Islands, and even visited the Liquejo, Liew-kiew, or Loo Choo Islands, which are described as rich in gold, and whose vessels visited the harbour of Malacca.

In 1516 the Portuguese navigator, Ferdinand Perez, arrived at the coast of China, in the Gulf of Canton, but the Portuguese were not permitted to enter the harbour and to trade there. They were consequently obliged to confine their commercial intercourse with this empire to a trade with the inhabitants of the island of Hainan and the adjacent coast, till, in 1557, they found means to ingratiate themselves with the Chinese government by being materially instrumental in the destruction of a pirate, who for a long time had ravaged the shores and adjacent islands of southern China. For this valuable assistance they obtained the desert island of Macao, where they soon made a settlement; and as on the change of dynasty in the seventeenth century they were so fortunate as to declare in favour of the party which, in the end, proved victorious against the then established government, the possession of Macao was confirmed to them.

While the Portuguese were still carrying on their coasting trade with China, one of their navigators, Ant. de Mota, was cast by a storm in 1542 on the coast of Nippon, one of the islands which compose Japan, the Zipangu of Marco Polo. The Portuguese were treated with great hospitality, and for some time carried on a very lucrative commerce. Japan was the most eastern limit of their discoveries, by which Europeans became acquainted with the real extent of Asia, and with a great part of its coast. Had the Portuguese only been merchants, the advantages accruing from the commerce with such rich countries would probably have induced them to conceal their discoveries from the commercial nations of Europe; but they entered the Indian seas as conquerors also, and their historians (Barros, Couto, Ed. Barbessa, the companion of Magalhaens, Faria y Sousa, &c.) found in their heroic enterprises a subject for national exultation.

The Portuguese had exhausted their strength in forming settlements both in the Old and New World. The spirit of the first conquerors no longer animated the nation, and their tyranny and intolerance made them hated in their colonies. At the close of the sixteenth century Portugal fell under the yoke of Spain; and one result of the struggle of the Netherlands against the power of Philip II. was the gradual transfer of the Portuguese possessions in the East to the hands of the Hollanders, their successful rivals on the sea. The Portuguese were expelled from Japan (1639) and the Moluccas; they lost Malacca (1641) and Ceylon (1656), with their settlements on the Coromandel and Malabar coasts; and they remained, at the conclusion of peace (1663), only in the possession of Goa and Diu, which they have kept to the present day. The Hollanders, though they extended the settlements during the century that they possessed the dominion of the Indian seas, acted more on mercantile principles, and did not materially increase our geographical knowledge of the countries in which they settled. They published, indeed, a few descriptions of some of their colonies, and their natural productions, especially of the plants and shells (Rumphius, *Ambonische Raritätenkammer*; Rheede, *Hortus Malabaricus*; Fr. Valentyn's *Beschreibungen*, &c.); but these works were generally defective in geographical information. The most important communication belonging to this period was furnished by the German

naturalist, E. Kämpfer, who, in the capacity of Dutch physician, resided in Japan from 1684-1692, and has given a good description of that country.

During the long-protracted contest between the Portuguese and Dutch in the seas of India, the most northern part of Asia which had not been known either to the ancients or moderns, suddenly emerged from the obscurity in which it had hitherto been involved. The sovereigns of Russia, who for more than two centuries had been dependent on the Tartarian princes of the family of Tshengis-Khan, obtained the full sovereignty of their country in 1461, and in the following century they extended their dominion, and with it our geographical knowledge, over the countries drained by the Don, Volga, and Ural, up to the Ural mountains, by the conquest of Kasan (1552) and Astrakhan (1555). In 1578 a chief or hetman of the Cosacks, Yermak Timofeyeff, who was in fear of punishment for having robbed some travellers, crossed the Ural range with a troop of his countrymen, and entered Siberia. The discovery of Siberia, and its subjection to the Russian sway, were pursued with such vigour, that in 1644 the mouth of the Amur was reached, and in 1648 the bold hetman Deshnef, favoured by a mild season, circumnavigated the most north-east corner of Asia, from the mouth of the Kowyma round the north-east cape to the mouth of the Anadyr, and thus proved that Asia was actually separated by an open sea from America. This fact, however, remained for a length of time problematical; the Russian navigator Behring (1725-1728), as well as Captain Cook (1778), found their way impeded by enormous fields of ice. In 1820-1824, the Russian captain Wrangel again succeeded in effecting this circumnavigation. The discovery and conquest of Siberia were completed by Peter the Great, who took possession of Kamtschatka in 1696.

Somewhat later, and still more unexpectedly, Europe obtained a complete geographical view of the immense empire of China, and a considerable part of central Asia. This was not due to conquest, nor to the activity and industry of travellers, but to science. The Jesuits had tried to convert the inhabitants of Japan to Christianity, and had met with more success than in any other country of Asia. But a persecution breaking out against them and their proselytes, from political reasons, the friars, who were now compelled to leave the country, directed their labors to China. Father Matteo Ricci, an Italian, a man of considerable attainments in astronomy and mathematics, soon acquired a great authority at the court of Peking, in 1600. One of his successors in the mission, Father Schall, was appointed chief of the bureau of *Heavenly Affairs*, and maintained himself in this place even after a revolution had taken place (1644), and the dynasty of the Mantshu emperors had ascended the throne. The Jesuits continued in favour to the middle of the last century (1759). During this time some of them had an opportunity of traversing various parts of the Chinese empire, and the countries of central Asia. Thus Father Ben. Goës travelled (1607) from India through Kashghar, Yarkand, and the desert of Gobi, to the great wall of China, and ascertained that *Katai* was northern China, and *Khambulu* the town of Peking, which till then had been considered as different countries and towns. Other Jesuits succeeded in insinuating themselves so far into the favour of the great emperor Kanghi, that some of them always accompanied him in his expeditions and travels, or were sent on certain missions. By these means they acquired a considerable knowledge of China and the countries dependent on it, as Mantshuria, Corea, and even of the great desert called Gobi, as well as of the manners, character, and institutions of the inhabitants of those countries. The observations of the Jesuits were published. But the greatest service which they rendered to geography was their map of China, which was made under the authority and at the expense of the Chinese government, by the friars Bouvet, Regis, and Jartoux, between 1708 and 1718; and after having been corrected by the friars Felix d'Arocha, Espinha, Hallerstein, and Gaubil, was published at Peking, by the authority of the emperor Kienlong in 1760, in 104 sheets. The great imperial geography, entitled *Tuy-tshing-y-thoung-tchi*, written by the order of the emperor Kienlong, may be considered as a commentary on this map. The second edition (1790) of this extensive work has been enlarged to 480 books, and we are indebted for our knowledge of it to the industry of some Chinese scholars, especially Sir George Staunton, Davis,

Morrison, Abel Rémusat, the Archimandrite Hyacinth and Klaproth. Modern travellers, especially the Dutch (J. Neuhof, 1755, and Van Braam, 1794), and the English (Lord Macartney, with Sir George Staunton and J. C. Hüttner, 1792, and Lord Amherst, with Ellis, Abel, Maxwell, Basil Hall, 1816), have added something to the before-existing stock; but the information which they have communicated extends only over a comparatively small extent of country. The voyage of Captain Maxwell, however, has materially improved our knowledge of the coast of the bay of Petcheli, and the peninsula of Corea, a coast which previously had not been examined with any degree of accuracy.

Whilst the conquests of the Russians in Siberia, and the operations of the Chinese government, opened to us the northern and eastern countries of Asia, our progress in the geographical knowledge of the southern and western countries was comparatively slow. The fanatical policy of the Turks, who, at the end of the fifteenth and the beginning of the sixteenth century, had got possession of them, shut up the roads through Asia Minor and the adjacent countries, which consequently were not visited, except by a few pilgrims. The policy of Persia, however, under the dynasty of the Sofides (from 1501-1722), was much more favourable to European travellers, many of whom got access to every part of the country, and even to the court, and collected very valuable information concerning the geography of Persia, the institutions, and the character and manners of its inhabitants. Such information is contained in the travels of Pietro della Valle (1614-1626), Adam Olearius and Albrecht von Mandelsloh (1633-1639), John Thevenot (1652), John Baptist Tavernier (1665), and especially in those of John Chardin, the court jeweller of the king of Persia and of Charles II. of England, who discovered the ruins of Persepolis; and of Francis Bernier, the physician of the emperor Aurung-Zeb, who first gave some information on the valley of Cashmere. Gasparo Balbi, a Venetian jeweller, made a journey to India (1579-1588), by the route of Aleppo, Bir, the Euphrates as far as Felugia, and Bagdad. Rauwolf, in 1574, also descended the Euphrates from Bir.

Towards the end of the seventeenth century the suspicious policy of the Turks began gradually to relax; and the first fruits of the zeal to explore the countries subject to their sway was the discovery of the ruins of Palmyra by Halifax in 1691, and the travels of another Englishman, Henry Maundrell, to Jerusalem in 1697. They were soon followed by the naturalist J. Piton de Tournefort, who explored Asia Minor, Armenia, and Persia (1701), L. Lucas the antiquarian, and the Dutch painter Corn. de Brayn, who visited Syria and Palestine; and, somewhat later, by the antiquarian Richard Pococke (1727), and C. Niebuhr (1766). In our times, these countries have been visited by Volney (1796), Seetzen (1802-1817), Clarke, Turner, Buckingham, and others. Arabia, which formerly had not attracted the attention of Europeans, and was only known from the description of Abulfeda, was pretty well explored in part of its extent by C. Niebuhr (1761-1765), and its geography, ethnography, and natural history have been considerably enriched in our times by Seetzen and Burckhardt.

The geography of India, that country which, since it first became known, had always most excited the curiosity of the learned, and attracted the speculations of the merchant, was longer involved in obscurity than almost any part of Asia. Up to the middle of the last century, its coasts were very imperfectly determined, and very little indeed was known of the interior of the country itself. A few travellers, as Thevenot, Tavernier, and Bernier, had given some information about a few districts and routes, but it was extremely scanty. The true geographical knowledge of these countries began in the Deccan with the wars of the East India Company and the French (about 1740), and in Hindostan with the conquest of Bengal (1757). From this time its progress was extremely rapid. A great part of the valley of the Ganges was soon explored and surveyed, and an account of the remainder, and of other districts of Hindostan, was obtained by the translation of the *Ayin-i-Akbari*, an historical and statistical account of the Mogul empire, composed by Abul Fazl, under the orders of the emperor Akbar [See *ABUL FAZL*.] The military expeditions against Hyder Ali and his son Tippoo Saib, rajahs of Mysore, gave that exact information of the southern parts of Deccan which is always

the effect of such operations. In the wars with the Pindaries and with the Mahrattas (1801—1818), the northern districts of Deccan and the central region of Hindostan were explored in a similar manner; and as in the wars with the then French government, the colonies of the French and Dutch (Pondicherry, 1793, Ceylon, 1796, Java, 1811) fell into the hands of the English, a full account of them, especially of the island of Java, then almost unknown, was published by Sir Stamford Raffles. The novelty of the scenes opened by these successive conquests induced many scientific men and exact observers of nature to explore these countries, and to them we are indebted for a number of valuable works. The most important are, Forbes's *Memoirs on Malabar*; Sir Francis Hamilton's (Buchanan's) *Travels through Mysore*; B. Heyne's and M. Wilkes's *Researches on Deccan*; Leichenault's *Botanical Excursions through Deccan* (1816); Lord Valentia's *Travels* (1802—1806); Bishop Heber's *Travels* (1824—1826); Malcolm's *Researches on Malwa* (1820); Tod's *Rajasthan*; A. Burnes's *Topographical Researches on Cutch, &c.*; and his *Examination of the Indus and the Penjab*. An account of the island of Ceylon is found in the works of Perceval (1796), and of J. Davy (1816—1820); and Sumatra was described by Marsden. Many separate memoirs, either inserted in the Transactions of the Asiatic Societies of Calcutta and London, or published separately, have illustrated the geography, geology, natural history, or antiquities of some separate district or place*. [See ASIATIC SOCIETIES.] It may be truly said that India, which little more than fifty years ago was less known than almost any other country of equal extent, has since that time been so well explored by the industry of our countrymen, that there are few countries out of Europe on which we have better information.

The extensive conquests of the English on the banks of the Ganges and its tributaries, involved them at last in political relations, and in a war with the tribes of mountaineers inhabiting the Himalaya range, especially with the Ghorkas in Nepal; and this led to the conquest, in 1816, of some of the elevated valleys of these gigantic mountains, which hitherto had remained entirely concealed from the admirers of nature. Their exploration soon became the object of the concentrated zeal of some of our most scientific countrymen. The great height of their pinnacles was determined, and their character explored by Raper, Webb, Hodgson, Crawford, &c. Penetrating through these valleys, Moorcroft (1812) succeeded in entering the high table-land of Tibet, where his progress was impeded by the jealous policy of the Chinese; he afterwards reached Leh in Ladakh (1820—1825), and then passed through the valley of Cashmere, which, since the time of Bernier, had only been visited by G. Forster (1783). Before his time, Tibet had already been visited by Turner, who was sent to the Teshoo Lama, the high priest of the Buddhists, as ambassador, and on his way traversed the valleys of Bhotan.

The political relations, which the East India Company were obliged to enter into with the countries lying on both banks of the Indus, gave rise to the embassy of Mountstuart Elphinstone to the court of Cabul (1809), by whom the whole region known by the name of Afghanistan, which till then had remained almost entirely unexplored, was at once opened to us. A similar effect was produced by C. Grant's embassy to the court of Sind (1809). After that time, Christie and Pottinger traversed Beluchistan, and those regions which antiently were known by the name of Gedrosia and Ariana, and had probably not been visited by an European since the expedition of Alexander the Great: in these journeys they discovered the table-land of Kelat (1810), and the roads which lead thence to Kerman and Herat. The recent journey of Burnes from the Indus into the countries on the Oxus river will make some important additions to our knowledge of these hitherto almost unknown regions.

Our knowledge of Persia has likewise received very important additions in modern times, especially from the industry of the English. This also has arisen from political relations: Sir John Malcolm, the author of the classical history of Persia, and Sir Harford Jones, were sent

to the court of Teheran, which they soon prevailed upon to place the organization of the Persian army in their hands, and to permit them to examine the Persian provinces with reference to their capabilities for defence. The result of these geographical researches was an improved map of Persia, and a list of routes through its provinces, published by Macdonald Kinneir in his *Geographical Memoir* (1813), who, in his travels (1813-14), examined also the roads leading through Kurdistan, Armenia, and Asia Minor. This information was greatly increased by J. Morier's travels, the labours of Ouseley in oriental geography and literature, by Ker Porter's and Rich's researches on Persian antiquities and architecture, and B. Fraser's travels, who in 1821 advanced to Mushed in Khorassan: Fraser first determined the height of the table-land of Iran, and corrected, by his observations, the southern shores of the Caspian Sea. Still more recently we have acquired valuable information from Captain Chesney's report on the Euphrates: the description of that river between Bir and Bassora, and many interesting facts as to its flooding, navigation, and the inhabitants on its banks, are contained in this unpublished document.

Of India beyond the Ganges nothing was known at the close of the last century except the coasts and a few ports; but the increasing power of the Burman empire soon produced political relations between it and the government of Calcutta, which in 1795 sent an ambassador, Col. Symes, to the court of Amarapura, accompanied by the naturalist Sir Francis Hamilton (Buchanan), from whom we have the first authentic account of that country. The war with the Burmese, which took place a few years ago (1824-26), made us acquainted with the valley of the Irawaddy, up to the capital of the Burman empire; and the ceded provinces (Aracan, Martaban, &c.), as well as the countries which were declared independent by the peace (Asam, Cashar, Munipore, &c.), began soon to be explored. During the negotiations for peace, Crawford was sent to Amarapura, and published an account of the Burman empire, by which he cleared up the geography of the peninsula beyond the Ganges as much as he had previously done by his account of Siam and Cochin China. This work and his history of the Indian archipelago, have considerably enlarged our views concerning the most unknown portion of India.

Next to the English the Russians have, in modern times, been most active in extending and completing our geographical knowledge of Asia. The establishment of mines in Dauria on the Amur, and in the Altai mountains between the Irtysh and Oby, gave rise to the travels of many scientific men, and the publication of several interesting travels and treatises. The most valuable works on the geography of Siberia are by Messerschmidt (1720), Dr. Müller, De Lisle de la Croyère, Gmelin, father and son, Falk, Pallas (1720), Georgi, Sivers (1791), and, in our times, Von Ledebour (1826), Dr. Meyer, Von Bunge, Hess, A. Erman, and Alexander von Humboldt (1829). The periodical missions to the court of Peking have added some information concerning the table-land which extends between Siberia and China, especially the travels of Timkowski (1819-21) and those of Von Bunge (1830), who first ascertained the elevation of the central table-land crossed in this journey.

The conquests of the Russians in Asia have given us a more complete knowledge of the Caucasus. Peter I. ordered a survey of the Caspian Sea to be made, which was executed by Simonof, and thus the true extent and form of that immense lake were first known. In the war against Persia in 1721-23, the northern ridges of Mount Caucasus and the countries watered by the Kur and Aras were explored; and discoveries were pushed farther south, when (1800) the province of Grusia fell under the sway of the Russians. After that time, the valleys of the Caucasus were visited and explored by Gildenstadt, Reineggs, Von Biberstein, Klapproth (1807), Parrot, and M. von Engelhardt (1815), Kupfer, and M. Lenz (1829), who at last succeeded in reaching the elevated pinnacle of the Elburz; Parrot had previously ascended the Ararat.

The Russians have likewise penetrated into the countries east of the Caspian sea, and surrounding the lake of Aral by passing through the deserts inhabited by the Khirghis Karaks. This was chiefly effected by the missions and embassies of Nazarof to Khokhand (1813), of Murawieff to Khiwa (1819), of Meyendorf and Eversmann to Bokhara (1820), and of Von Berg, Lewchini, &c., to the Lake of Aral, since 1823.

* Col. Lambton executed (1804—1812), under the orders of the East India Company, a trigonometrical survey of the southern part of Deccan, and measured a meridian from Cape Comorin northward to the Nerbudda in Malwa, nearly sixteen degrees in extent, and on this survey all our modern maps of India are constructed. Some others have added a few districts, as Dangehaid, Tod, and Burnes.

IV. General view of the extent and figure of Asia.—Asia lies to the east of Europe and Africa; it is separated from Africa by seas, except at one place, where these two great divisions of the globe are joined by the narrow isthmus of Suez. With Europe it is connected by extensive tracts of land under the meridian of the Ural, which mountain range, together with the desert and deep-lying plains that extend along the lower course of the Volga and the northern extremity of the Caspian Sea, ought to be considered as the natural boundary between Europe and Asia.

The great depression of these steppes, in which the town of Orenburg is not higher than the level of the Atlantic Sea, and the surface of the Caspian is more than 300 feet below it, is the characteristic physical peculiarity of the region on the common boundary of Europe and Asia; and it has greatly influenced the condition of the human race in the adjacent countries.

In the changes, to which the nomadic tribes in the interior of Asia were frequently subject, some of them were driven through that immense gate, which opens between the Ural range and the Caucasus, towards the eastern countries of Europe, richly endowed by nature with a soil fit for agriculture; and in this way a continual migration was effected.

Asia, whose area is more than five times that of Europe, differs materially in its physical figure from Europe and Africa. Africa is like a body without members, but Asia extends its limbs in three directions, preserving at the same time a preponderant mass of body; Europe, on the contrary, which may be considered as an appendage or continuation of Asia, exhibits a preponderance in its numerous limbs over the mass of the body.

The great mass of Asia may be compared to a four-sided figure, whose four unequal angles are placed respectively on the isthmus of Suez, the innermost angle of the Gulf of Tonkin, Cape Shalatzkoi in Siberia, and on the peninsula adjacent to the Gulf of Carra, east of Nova Zembla. It consequently extends to the south of the Tropic of Cancer, and in some parts stretches north of the Arctic Circle. The northern side of this figure, lying within and parallel to the Polar circle, is the shortest, extending only about 2700 miles; that near the Tropic, the longest, measures upward of 5000 miles. Four-fifths of the whole area of Asia, or about fourteen millions of square miles are comprehended in this figure; the whole of its surface amounts to about seventeen millions and a half.

From this extensive continental mass, which may be considered as the body of Asia, its members project on the east, south, and west, in the form of peninsulas and headlands. These peninsulas are that of the Tshuktsches jutting out towards America (with an area of 64,000 square miles), that of Kamtschatka (containing 56,000 square miles), that of Corea of equal extent, the curved arc of the coasts of China, and the three extensive peninsulas stretching south into the seas of India and Arabia,—the peninsula beyond the Ganges occupying 777,000 square miles, India within the Ganges comprehending upwards of a million of square miles, and Arabia about an equal extent: the three last, taken together, have an area nearly equal to Europe. And lastly, the peninsula of Asia Minor, which, not unlike a bridge leading to Europe, has served to facilitate the passage of nations and of civilization. The northern coast alone, though much more indented than any part of the coast of Africa, does not exhibit in its formation peninsulas of great dimensions. These members, detached from the main body of the continent, contain nearly three millions and a half of square miles.

It may be observed that the extensive tract of land which occupies the centre of the continent, and is beyond the reach of any of the seas enclosing Asia, is far superior in extent to the members which surround it; this tract forms what may be called *Central Asia*, and has remained in a state of lasting uniformity, in manners and civilization, whilst its appendages, which lie round it, have undergone numerous changes and made great progress in the arts of civilization.

If we consider—and we think we ought to do so—the islands which lie near a continent as its insulated members, we may say that no part of the globe equals the southern part of Asia in the luxuriance of this formation. Here lies the group of the Sundas with its thousand islands and islets, the most extensive archipelago of the globe, which forms an easy passage to the continent of Australia and to the Pacific Ocean and its numerous groups. Thus Asia exhibits

the greatest contrasts on the surface of the globe. Its interior presents to our view the most extensive, uninterrupted continental formation; and its southern extremity is more split into separate members, and varies more in rapid succession of land and sea, than any other part of the globe of equal extent.

Asia, exhibiting such characteristics in its outline, is no less remarkable for the formation of its surface, on which the climate, and consequently the vegetation and animal kingdom, of its different parts must chiefly depend. In examining the other divisions of the globe, we find that Australia exhibits level and comparatively low countries without any extensive high mountain-range, as far as we yet know. Africa is divided into two nearly equal parts, the southern of which forms an almost uniform table-land, whilst the northern, with the exception of the Atlas region, may be considered as a lowland. Europe contains in all parts plains of small extent lying between dispersed mountain-groups and ridges. In America all the highest land lies on one side, occupying its western coast from the extreme north to the south: it forms the most extensive system of mountain-chains on the globe, which inclose within their arms elevated plateaus, but of comparatively small extent. Asia exhibits different features. The whole mass of the interior continent rises to a considerable elevation above the sea, and this elevated mass, of which the high table-lands occupy by far the greatest extent, is not placed at one of the extremities of the whole mass, but occupies its centre.

From these table-lands, which occupy the centre, the surface descends in gradual and diversified terraces and slopes to the level lowlands which surround them. The table-lands themselves are traversed by numerous mountain-chains, and are everywhere enclosed by high ranges: but though these mountains are among the highest and most extensive on the globe, they occupy, when compared with the table-lands, a comparatively small surface. Their influence on climate and organic nature cannot therefore be equal to that which the table-lands themselves exercise, and consequently their relation to these latter is only subordinate. This observation applies even to the colossal range of the Himalaya, which forms the southern boundary of the extensive systems of table-lands occupying central Asia.

The table-lands, in the interior of the continent, form two separate systems different both in extent and in elevation: they are, as it were, two terraces, a higher and a lower one. The eastern system of these table-lands comprehends the plateau of Tibet and that of the great desert called Gobi, and the countries lying between them; it rises from 4000 to 10,000 feet, and in some parts still more, above the sea: the western, containing the plateau of Iran (Persia), does not generally attain the height of 4000 feet. The latter may occupy an area of about 1,700,000 square miles; the former, more than thrice as large in extent, contains about 7,600,000 square miles, and both taken together more than two-fifths of all Asia; the remainder of the continent is occupied partly by the terraces, by the intervention of which the table-lands sink gradually towards the lowlands, and partly by the lowlands themselves. The length of both systems of table-lands taken together and measured from west to east, from the Black Sea and the Persian Gulf to the sea adjacent to the coasts of Corea, is upwards of 5500 miles. Its breadth from south to north varies considerably: it occupies in its greatest extent on the east, between its southern boundary in the Chinese province of Yunnan and the northern in the country of the Mantshu Tunguses, from 1800 to 2000 miles; but on the west, between the coasts of Carmania and Gedrosia in Beloochistan, and the steep slopes to the lowlands of Bucharia, less than 700 miles.

The boundary of these plateau-regions is marked by Taurus and Caucasus at the north-western extremity, and by Mount Elburz at its slope towards the deep depression of the Caspian Sea; it afterwards advances farther north in the Altai range in Siberia, and on the north-eastern extremity is bounded by the alpine region of Da-uria. On the east the boundary is indicated by the mountain-ranges in western China, which have no common name, but extend from the western extremity of the Great Wall to the Snow Mountains (Siute Shan) in Kuang-si and Yunnan northward, to the innermost angle of the Gulf of Tonkin. The southern boundary is formed by the Himalaya range and

its branches, extending eastward and westward, the latter of which are known by the name of Hindu-Coosh or Hindu-Kuh. Farther to the west, where the plateau of Iran projects towards the south, the table-land region is separated from the Indian Sea by the mountains of Beluchistan, and thence from the Gulf of Persia by the steep Persian mountain-range (in its northern course called Zagrus), which extends along the coast of the gulf, and bounds the Tigris valley on the east: it afterwards joins the chains of Taurus and Amanus, where the Tigris and the Euphrates issue from the mountains. Here the boundary between the lowlands of Mesopotamia and the table-land is very distinctly marked; and from this point the range proceeds westward, under the name of Mount Taurus, and fills, together with the table-lands enclosed between its arms, the greatest part of the peninsula of Anatolia.

Both systems of table-lands are so connected, that, properly speaking, they form only one elevated and continuous protuberance on the surface of the earth, but they decrease considerably in breadth where they join one another; and exactly at this point of junction numerous high masses rise and form an extensive mountain-knot, where the ranges of the Himalaya, Hindu-Kuh, Thsungling, and Belur, meet one another; thus these table-lands are, at the same time, joined and separated in a very characteristic manner.

From the extremity of these table-land systems, especially on the south-east and north-east, south-west and north-west, there issue several separate mountain-chains, not connected with one another, but which form more or less a part of the table-lands themselves. By this peculiarity the highland of central Asia, as far as regards its surface and its extremities, appears not less indented and cut into several divisions and members than the whole continent of Asia on its shores and its exterior figure; the valleys, which by this indentation are produced on the borders of the table-lands, afford peculiar advantages for the progress of civilization. For, as we have already observed, the highland of Asia does not sink on one side only, but on all sides and towards every point of the compass; towards different oceans also, which are everywhere separated from the highland by extensive plains, varying greatly in magnitude and form. This circumstance, added to the valleys formed by the indentations in the exterior margins of the highlands, has given rise to numerous and most extensive river systems, which, descending through the intervening terraces, direct their winding course towards the north, south, west, and east, and thus give to the internal countries of this continent an open communication with the ocean.

The eastern highland of Asia is divided from the western, or, more accurately, the table-land of western Tibet from that of eastern Iran, between the meridians of Balkh and Cabul, by a tract of a peculiar nature. The eastern highland, much larger in extent and of higher elevation, presents more rigid forms, and has the figure of an irregular trapezium; the western has that of a rectangle extending towards the north-west, and is in every respect of a milder character. The mountain-knot formed at the common junction of the several mountain-ranges, which the companions of Alexander called the Indian Caucasus, and which now bears the name of Hindu-Coosh, is an extensive alpine region, or rather a mountain-isthmus, extending between the lowlands of Bucharía and of India, and uniting both highlands in the direction east and west, not unlike the isthmus of Panama, which connects the mountain region of North America with the Southern Andes.

To this peculiarity in the formation of this part of Asia we must add another, namely, the parallelism observable in the direction of the mountain-ranges which form the southern border of the highlands, or, in other words, their southern slopes. They extend in a diagonal direction from E.S.E. to W.N.W. The Himalaya range, which forms the slope of the table-land of Tibet, and extends from the Gulf of Tonkin to Cabulistan, a distance of nearly 2800 miles, is parallel to the Taurus-range, which, bordering the table-land of Iran on the south, extends from the mouths of the Indus to the western extremity of the Taurus in Lycia in Asia Minor, and is nearly of equal length.

This southern chain of the Taurus system is also parallel to the mountain-range which bounds the highland of Iran on the north, and which, considered as a continuation of the mountain-region of the Hindu-Coosh, is traced to the Demavend and Elburz near the southern shores of the Caspian Sea, and thence through Azerbaijan and Armenia,

though its surface exhibits great varieties in this part, till it terminates with Olympus and the heights of Ida on the shores of the Dardanelles, presenting towards the Black Sea rapid slopes. This northern chain of the Taurus system is nearly equal in length to the southern, extending upwards of 2500 miles. The Caucasus itself, which extends about 680 miles on the isthmus which separates the Caspian from the Black Sea, though it is some distance farther to the north, has nearly the same general direction.

But this parallelism, so remarkable in the western highland, is not observed in the eastern. Here too, indeed, some of the mountain-ranges traversing the table-lands run in the direction of west and east; but this is not the case with the principal chains, the Kuen-luen ($35^{\circ}30'$ N. lat.), the Thian-shan (42° N. lat.), and the Altai mountains, farther to the north. In these mountain-ranges a decided divergency is observable. The distance between them widens as they proceed eastward till the most southern of their members, formed by the mountains of India beyond the Ganges, terminates on the peninsula of Malacca, opposite the Sunda islands; and the most northern, the Baikal and Da-urian range, traversing the countries on the Gulf of Okhotsk and the peninsula of the Tshuktsches, approaches the most northern shores of North America.

This diversity in the formation of the surface of eastern and western Asia has had corresponding effects on the civilization of their inhabitants. The divergency of the mountain-ranges in the eastern regions placed the nations inhabiting them at greater distances, whilst the convergency in the centre and in the western region produced a nearer approximation and more easy communication. But, after all, the great features of its formation, which determine its capabilities of influencing organic nature and the history of men, exhibit a marked direction east and west.

To form a complete picture of the varieties in the formation of the surface of Asia, we must add to these mountain-ranges extending in a diagonal direction others which meet them nearly at right angles. Such are the Belur Tagh, or Beloro, which is ascended in passing from the deep steppes of Bucharía eastward to the high table-land of Turkistan, and the towns of Kashghar and Yarkand; and the Soliman range, on the eastern border of Iran, which must be traversed in passing from the lowlands of India to the table-land of Persia. By these mountain-chains the most characteristic features in the formation of Asia are completed.

We have remarked that the two great systems of high table-land are connected by an Alpine region extending between the far advancing angles of two lowlands; that of India from the south, and that of Bucharía from the north, which seem to tend to meet one another, but are interrupted by the high summits of the mountain-region. Such a juxtaposition of all the great features which nature exhibits on the surface of the globe, on such a colossal scale, and in so limited a space, makes this one of the most remarkable spots on the face of our planet. This maximum of the contrasts of natural features, placed in the centre of the continent, is the principal characteristic which distinguishes Asia. By drawing a circle with a radius of a few hundred miles round this common centre, we comprehend in it the countries of Cashmere, Sogdiana, and Cabulistan, the ancient empires of Bactria, Delhi, and Samarcand, the cold table-lands of Tibet, of Khutan, and of Kashghar, up to the ancient Seres and Paropamisadum; the most elevated snow-topped summits on the globe, the richest and most diversified Alpine regions and valleys, the sources of the greatest and, in an historical point of view, of the most remarkable rivers of central Asia, the Penj-ab of the Indians on the south, the famous Mawar-al-nahr on the north, and the richest plains in these lowlands; we have Persia on the west, India on the east, Bucharía, Turkistan, and Tibet, on the north. It is the centre of Asia fixed by nature; one of the great physical influences which prompted man to progress and to civilization in the early ages of his history. How numerous and powerful must be the inducements to change in a country where the climates of the polar region come nearly in contact with those of tropical countries intermingled with the temperate zone; and where this diversity of climate is found within a space so limited, and yet diversified by hundreds of different slopes, terraces, and valleys, which, partly watered by rivers and torrents, and partly entirely without running water, are placed near one another, but often rise to such different levels above the sea! What an influence must such a country exercise on

organic nature, and on the civilization and history of man; and how powerful must this influence have been through all the generations that the human race has existed!

To these two great and characteristic features, namely, the splitting of the south-eastern part of the continent into peninsulas and innumerable islands, and the great contrasts exhibited in the formation of the surface in the centre, we must add a third, which belongs to western Asia. This characteristic feature is partly its external form, and partly its geographical position in the centre of the antient world, to which we may add the influence which it has exercised on the progressive civilization of the inhabitants of the whole globe. As Asia is here connected with Europe and Africa, the three great divisions of the globe are thus brought into contact, and the intercourse thus established between the different nations inhabiting them is still more facilitated by the great maritime roads which nature has placed in this centre of the antient world—the gulfs of Arabia and Persia, the Caspian Sea, the Black Sea, and the sea which extends between Egypt and the peninsula of Asia Minor. This part of Asia is not characterized like the south-east by being split into manifold divisions and members, by which the phenomena of nature are multiplied and diversified, and the intercourse of nations and their progress in civilization facilitated; nor does it exhibit great contrasts in the formation of its surface: but we find here, in the western regions of Asia, more than at any other place, extensive countries surrounded and penetrated by considerable branches of the sea, which characteristic is rendered more important by being placed where the east and the west approach one another.

Such are the great features which characterize the external form and the interior surface of Asia. We shall attempt to indicate the peculiar character of each of these great natural divisions.

First of the eastern highland, or system of table-lands. The axis of its elevation, or its highest part, lies in a direction from south-west to north-east, and begins between Cashmere, Badakshan, and the Tshungling, on one side, and the Kailas mountains, and the sacred lakes of Manasarowara and Hrawan-hrad in Tibet, on the other, east of the sources of the Ganges; it extends to the snow-covered heights of Mount In-shan, situated at the most northern bend of the Hoangho river, and thence it traverses the Khing-khan mountains east of the lake of Baikal, which form the southern and south-eastern border of the great desert of Gobi, to the most northern bend of the river Amur, which seems to be caused by the north-eastern extremity of the axis. On this most elevated part of the eastern highland the table-lands of Great and Little Tibet probably rise to the height of from 10,000 to 14,000 feet above the level of the sea (those of Little Tibet measured on the banks of the Upper Satadru or Setledge); and perhaps the elevation of the deserts of the Gobi, about the lake of Khukhu-nor, or Koko-nor, is not much less. Farther to the north-east, the great caravan-road, which traverses the desert of Gobi between Kiachta and Peking, the table-lands sink considerably, and attain only the height of from 3000 to 4000 feet. This axis of the highland, which is inhabited by Tibetan and Mongol tribes, is not parallel to the separate mountain-chains which traverse the irregular trapezium of the highland from west to east, but cuts them in a diagonal direction. That part of the highland which is situated to the south-east of the axis seems to contain some very high table-lands; but the greatest part of it is probably occupied by very high mountain-ranges, which descend towards the adjacent low-countries with a rapid and steep declivity, and by themselves constitute the most extensive mountain-region of the globe. This Alpine region, however, if we except a small part of the Himalaya range, is almost entirely unknown to Europeans.

To the north and north-west of the axis extends the greater of the two triangles composing the trapezium of the Eastern Highland of Asia. It sinks gradually towards the lakes of Baikal, Zaisang and Aral, forming a series of terraces which continually exhibit less of the characteristic features of the table-lands, till they terminate with the steppes round the lake of Aral, which are below the level of the ocean; the surface of the lake of Aral itself is 186 feet beneath the level. These steppes, therefore, do not form a part of the Highland, but of the low and deeply depressed plains which surround the Caspian Sea and the lake of Aral. At present only the elevation of the large

lakes which lie on the northern borders of the lowest terraces, and in their most depressed cavities, has been determined with any degree of exactness. The lake of Zaisang is upwards of 1600 feet above the level of the sea, according to the measurement of Ledebour and Humboldt; the lake of Baikal nearly 1800 feet, according to Ernan; and Kiachta, the great commercial town between Siberia and China, situated on a second and higher terrace, is 2530 feet above the sea, according to the barometrical measurement of Erman. During the latest Russian mission to China, a series of heights was ascertained across the Gobi by Bunge and Dr. Fuss, from Kiachta to Peking; and it was found, that the pass leading over the mountain-chain of the Dshirgalantu, lying south of the Chinese provincial capital Urga, and on the south of the river Tola, is only 5005 feet above the sea; and that on the southern border of the Gobi, not far north of Peking, the highest mountain-passes which are crossed by the great Chinese wall are only 5525 feet above the sea-level.

Between Urga and the great wall extends the desert called the Gobi. It is not a level plain, but sinks towards the middle, where it is about 3000 and in some places only 2600 feet above the sea, and forms a long extended flat valley, lying from west to east. The lowest part of this valley is occupied by the proper Gobi, called also Shamo (i. e., sea of sand); its surface is covered with sand, and abounds in salt. In all its extent it displays the traces and phenomena of having once been covered by the sea, and among the Mongols a notion still exists that it will again be filled with water.

Farther to the west, towards the Gobi of Hami called Han-hai or the dry sea, the table-land probably rises again, but still farther to the west it is perhaps again furrowed longitudinally from west to east by a wide and extensive depression of the surface. We are induced to make such a conjecture by the course of the large river traversing Kashghar and Yarkand, which running eastward terminates in the lake Lop, which probably occupies the lowest part of the valley. The culture of cotton and the vine in Chinese Turkistan, along the tract indicated, together with its numerous commercial towns (Kashghar, Yarkand, Aksu, Kutsche, Karashar, Turfan, Hami), which are traversed by the great road leading over central Asia to China, render it very probable, that this valley is not much elevated above the level of the sea, and that the countries lying in this direction offer no great obstacles to travelling. This valley is bounded by two high mountain-chains, running west and east, of which that to the north is called the Thian-Shan (Bogdo Oöla) range, and the southern the Kuen-lun (Koul-koun) mountains. These two extensive mountain-ranges may be called the interior mountain-chains of the Eastern Highland of Asia; the Altai mountains on the north, and the Himalaya range on the south, constitute the exterior mountain-chains of this elevated region.

Between these four extensive mountain systems lie the three wide plains which occupy the central countries of Asia, and in which respectively are found the three large lakes of Balkash, Lop, and Tengri. These three plains comprehend the three countries known under the names of Zungary, Tangut and Tibet, and their general level probably rises higher and higher as they advance from north to south.

The mountain-chains of the Eastern Highland of Asia are little known to us, if we except a small portion of the Altai mountains, and a part of the Himalaya-range. Of the Altai mountains, only the most western ridges, to the east of Semipalatinsk, between the rivers Irtysh and Oby, have been explored, and hæc only their northern slopes, which are known by the name of the Altai Ore Mountains (or Erzgebürge), because they yield annually 70,000 marks of silver and 1900 marks of gold: they rise near Kolywan to about 5400 feet above the sea. But the higher snow-topped ranges called the Altai Bielki, in which excellent jasper and porphyry are found, and which extend farther to the east, near the lake of Telezkoi, attain a height of 10,000 feet and upwards. Neither the woody mountains surrounding the lake of Baikal, nor the Da-urian ranges, which contain rich veins of silver, have so great an elevation, though their height has not been ascertained by actual measurement. They are however remarkable for their formation; their tops do not present craggy summits, but rather extensive and nearly level plains like the table-lands.

The mountains in the interior of the Highland are not

known, except a few spots, which have been traversed by travellers and caravans. Neither their height, direction, nor position is exactly ascertained.

The Himalaya mountains are much better known, at least a part of them, though it is only a comparatively small portion. If we limit the application of this name to the mountains which lie between India and Tibet (though indeed it might with good reason be extended much farther), we find that only a fifth of the mountain-range has been partly explored; that portion which has been measured is still much smaller, though perhaps it is the highest part of the whole system. It comprehends the A-pin country about the sources of the Ganges; the Jumna, a tributary of the Ganges; and the Setledge, a tributary of the Indus. This Indian Alpine region exhibits a greater variety of elevated scenes, natural productions, tribes of men, and difference of political constitutions, than any other mountain-country on the globe. Besides rising in colossal forms to a great height, it covers a great surface of country. In length it is about 1300 miles, and would cover in Europe all the countries between the Pyrenees and the sea of Azof. Its breadth is from 250 to 350 miles. Compared with the Alps, the Himalaya mountains exceed them twice in breadth and thrice in length; the Alps occupy an area of about 130,000 square miles, but the Himalaya from 500,000 to 600,000 square miles. It consists of a great number of ridges running parallel to the direction of the whole range from south-east to north-west, which, however, in many places, are connected with one another by transverse ridges, and in others separated by deep and narrow ravines and glens, in which the different branches and tributary rivers of the Indus and Ganges run. The whole chain, beginning from the high pinnacles of the Hindu Coosh, near Cabul, and terminating in the most eastern valleys of Asam, near the source of the Brahmapootra, is overtopped everywhere by the most elevated ranges, which are always covered with snow—a circumstance which has given rise to the Indian name *Himā-laya*, signifying *the dwelling of snow*.

The whole range may be divided into three sections. The most eastern, or that of Asam and Bhotan, is less known than the remainder. Though it exhibits many high summits, only the peak of Caamalari, near the boundary of Tibet and the road leading to Teshoo Loomboo, has been seen at a small distance by Turner, who estimated its height at about 25,000 feet above the level of the sea.

The central region of the Himalaya range comprehends the mountains of Nepal, which have been examined with some care by the English residents at Kathmandu, the capital of Nepal, which town, situated in a valley of the range, is, according to Colebrooke, 4784 feet above the sea. Three groups of high peaks which rise above the line of eternal snow, between the valleys of the Upper Trisul and the Upper Gandaki Ganga, have been measured. The groups of the Salpu mountains and that of the Dhayabung mountains are nearest to Kathmandu, on the north of the town; eight of their peaks which have been measured are from 16,000 to 24,000 feet above the sea. Some days' journey to the north-west lies a still higher group, containing five peaks, not one of which is less than 22,000 feet, but the Sweta-ghar (or the White Tower) attains 25,261 feet, and the Dhawalagiri (or the White Mountain), 28° 30' N. lat., 83° 30' E. long., 28,000 feet. The latter is the highest known pinnacle on the globe. Except their heights, very little is known of these gigantic mountains.

The western region of the Himalaya range comprehends the ridges traversing the Alpine countries of Kamaoon, Gherwall, Bissahir and Sirmore; and as these countries are dependent on the East India Company, the mountains have been explored with great care, and even trigonometrically measured. Here we find the very high group of the peaks of the Iawahir (30° 22' 19" N. lat., and 79° 57' 22" E. long.), between the upper courses of the Gores and Dauli Ganga, on the boundary between Kamaoon and Bhotan, to the south of the Niti Ghat (16,895 feet) and to the north of the town of Almora (5337 feet above the level of the sea), which, rising to the height of 25,749 feet, was considered by Hodgson, at the first measurement, the highest mountain on the globe. These summits have only been measured from a distance, and the mountains are not yet explored; but their elevation has been determined by the measurement of Hodgson, as well as that of Webb. To the east of this extensive group, the country between the upper courses of

the Gores and of the Kali, the two principal branches of the Kali-Gogra, is covered with a mass of mountains, many of which rise above the line of eternal snow; twelve of their peaks, measured by Webb, attain the height of from 18,000 to 22,000 feet; but they have not been explored in their valleys and ramifications. Still more crowded are the snow-covered peaks to the north-west of the group of the Iawahir summits, especially between the sources of the Vishnu Ganga and Bhagirathi Ganga, where are the colossal summits of Kedarnath and the Rudra Himalaya. This is the case also about the sources of the Jumna, where we find the Bunderpuch and the high chain, which divides the north-western branches of the last-mentioned river from the valley of Baspa and the Setledge, which latter chain is traversed by twelve mountain-passes, and connected with the Ralding Kailasa mountains, on the banks of the Setledge. Even on the north-western banks of this river we find the snow-covered summits of the Kotgerh and the Purkyul. These alpine regions have been explored by Hodgson, and others have continued his survey. Hodgson counted, at his first survey, upwards of fifty summits, rising with craggy conical peaks above the line of eternal snow, of which twenty-three attained upwards of 20,000 feet, and seventeen exceeded in height Mount Chimborazo. The number of the snow-covered mountains which extend farther to the north-west through the alpine region of the Kulu Cash-mire Himalaya range and approach the Hindu-Coosh mountains near Cabul, seems nearly innumerable, but none of them have been measured or otherwise explored. The Hindu-Coosh itself, to judge from the great masses of snow with which it is covered, seems to rise to nearly equal height.

Along the lowest southern slopes of the Himalaya mountains extends a flat country, hardly a thousand feet above the sea, covered with bogs and forests, exposed to a sultry heat, and dreaded by travellers on account of the prevalence of fevers. It is called Tariyana; its inhabitants are disfigured by goitres. The adjacent ridges, and the lower valleys (called Duhs) of the Alpine region, which rise to the height of from five to six thousand feet, and in which are situated the capitals of the Alpine states, as Rampur on the Setledge (3375 feet above the sea), Sirinagur on the Alakananda Ganga (2300 feet), Almora on the Kosil (5337 feet), Kathmandu, &c., are among the best watered most luxuriant, fertile, and picturesque Alpine countries in the world. To the north-east of these places the mountains rise, but only at a considerable distance attain the line of eternal snow. They are arranged in numerous ridges, commonly running parallel to one another and in the direction of the whole mountain-region, but connected by transverse ridges and groups, and separated by frightfully deep and steep ravines running in some places longitudinally, in others transversely. The most northern of these chains rises above the level of the high table-land of Tibet, and forms the boundary of the highland of eastern Asia. On the side of the table-land they descend with a gentle slope, and soon terminate in extensive undulating plains. The intercourse between India and Tibet is carried on over these high ridges by means of the mountain passes, the lowest of which are probably not much below the height of Mont Blanc, being nowhere less than 14,000 feet above the level of the sea; and some rise even to 18,000 feet.

Nothing renders the Himalaya mountains more remarkable than the different level to which the lines of vegetation ascend on the lower ridges adjacent to the plains of Hindustan, on the interior ridges, and again on the boundary ridges of the table-land. This level, as well as the line of eternal snow, rises higher as the ridges approach the table-land, and thus the higher regions are cultivable and inhabited at an elevation where lower down no habitation and no agriculture are found. A. Gerard has carefully examined this remarkable phenomenon, and has stated the following facts, observed in ascending the valleys of the Sutledge. He divides the whole mountain-range into three regions. Region A, lying along the southern slopes of the Himalaya range, displays cultivated fields to the height of 10,000 feet, but the corn must often be cut green; the highest inhabited place is 9500 feet; the upper boundary of trees 11,800; the upper boundary of shrubs 12,000, and in some well-sheltered places, dwarf birch and little shrubs are found at 13,000 feet. Region B comprehends the higher ridges of the mountains, and here, in the valley of the Baspa, the highest human dwelling is 11,400 feet above

the level of the sea, and this is likewise the highest point which agriculture attains; trees are found at 13,000 feet and upwards. Region C extends over the table-land itself, where villages are built at the elevation of 13,000 feet; fields are cultivated at 13,600; very good birch forests grow at 14,000 feet, and some low shrubs, especially tamar, used as fire-wood, attain to 17,000 feet above the sea.

The highland of eastern Asia is on every side surrounded by extensive terraces, through which the great river-systems descend to the low lands bordering on the ocean.

On the mountain-ranges which bound the table-lands on the north four great rivers take their rise; the Irtysh from the lake of Zaizang joins the Obi and Tobol; the Yenesei unites with the Angara, which issues from the lake of Baikal, and with the two Tunguskas; the Lena, with its great tributary the Witim; the fourth is the Amur. They run respectively 2000, 2500, 2000, and 1900 miles, measured along the course of the rivers. The Irtysh, with its tributaries, drains upwards of 1,300,000 square miles, the Yenesei about 1,000,000, the Lena nearly 800,000, and the Amur about 850,000,—all taken together, a surface much more extensive than that of Europe, and by far the greatest part of it belongs to Siberia. They abound in fish, and have plenty of water, so that two-thirds of their courses are navigable; but the lower part is for more than six months of the year covered with ice. This causes in spring-time an excessive swelling of the waters in the upper branches and tributaries, by which their banks are torn off, and great masses of rocks and earth carried down, and strewed over the flat country along the lower course of the river. The navigation on the principal water-courses from south to north is, for this reason, very inconsiderable; but it is much more important in their tributaries running east and west, by means of which a water-communication is established through the greatest part of the countries lying between the Ural Mountains and Okhotsk.

From the mountain-region, bordering on the highland of eastern Asia, two extensive terraces descend gradually towards the Pacific Ocean, besides a great number of smaller ones. The latter are watered by smaller rivers, but the two former give rise to the two great river-systems of the Hoang-Ho and Kiang (Kinch-Kiang, Ta-kiang, or Yantse-kiang), of which the former runs upwards of 2000, and the latter more than 2900, if their great bends are taken into account. Each of them carries off the waters of a surface of above 700,000 square miles. The Chinese call them the sons of the ocean, a name probably derived from the tides ascending them upwards of 400 miles, by which they are changed into seas of fresh water, and rendered navigable to a great distance from the sea. This great advantage of the Chinese rivers, arises from their geographical position with respect to the Pacific Ocean, in which the tides rise to the greatest height. The sources of these two rivers are not very distant from one another on the table-lands, but in their middle course they are widely separated to the north and south by the ranges which form the borders of the highland; in the lowlands of China, however, they converge again, and their embouchures are only about a hundred miles distant from one another; but before they fall into the sea, they are connected by numerous canals. The tract between these rivers may therefore be considered as one immense *delta*, and the rivers themselves as a *double* river-system, formed on the most colossal scale, between which is situated the best cultivated country on the globe, central China, which to these rivers is indebted for its system of canals, and its civilization.

The rivers of southern Asia form three distinct groups, of which those of India east of the Ganges are little known: only their mouths and the lower parts of their course have been explored. These rivers, of which six or seven run a considerable distance, taken together, contain probably a greater volume of water than all the rivers of the northern half of Africa. Their course lies from north to south, or S.S.E., and the valleys drained by them extend in a parallel direction between the mountain-ranges, which are as uniform as the valleys, and widen towards the Sunda Archipelago, in the shape of a fan. The rivers of Camboja, Siam, and Pegu, which are the largest, carry off a great volume of water, and are navigable to a considerable distance from the sea; but they have not yet been explored, except the river of Pegu or the Irawaddy, which, in the late war with the Burmese, was navigated by armed vessels, and ascended by the steam-boat *Diana*, up to the town of

Ava, 446 miles from its mouth. It is said to be navigable for boats three hundred miles higher, to B'hamo. Its upper course was visited in 1827 by Wilcox and Burlton, who, setting out from Sadiya in Assam, traversed the Lang-tam mountains, and had a view of the river in $27^{\circ} 30' N.$ lat. only about fifty miles from its sources, which lie in the snow-covered mountains farther north. At this place, the Irawaddy is about eighty yards wide. On the maps of D'Anville, this river seems to be identical with the Zangbo-tsu, or the great river of Tibet, which flows to the south of H'Lassa; and some passages, quoted by Klaproth from Chinese authors, confirm the conjecture of the French geographer. If this is true, the Irawaddy has a course of nearly 2000 miles, and its sources lie at no great distance from those of the Ganges. But the information collected by Crawford in Ava, and by Wilcox in Assam, is not in favour of this hypothesis. [See BRAHMAPOOTRA; ASAM; and *Asiatic Researches*, xvii. p. 457, &c.]

The rivers of India, within the Ganges, run in a direction quite different from that of the rivers beyond the Ganges, which are parallel to one another. The Ganges and the Indus take a diverging course and enter different parts of the sea; but their tributaries, especially the Jumna and the Sutledge approach one another, and facilitate the commercial intercourse of the nations which inhabit the banks of the principal streams. The advantages which result from these rivers flowing into different gulfs are still greater. The Gulf of Bengal brings the inhabitants of the peninsula into communication with the nations of Malay origin and with the Chinese, whilst the Gulf of Malabar opens to them the coasts of Persia and Arabia. It is principally through this direction of its rivers that India within the Ganges has enjoyed such opportunities of civilization over India beyond the Ganges.

The river-system of the Ganges and Brahmapootra extends about 1300 miles in length, and drains a surface of nearly 650,000 square miles. The Ganges rises in the Himalaya mountains, in the most elevated regions of the globe, covered with extensive masses of snow, from which abundance of water continually descends, and is carried off by a dozen great rivers, many of which exceed the Rhine in volume and in length of course. These rivers enter the Delta of Bengal, which is twice as large as that of the Nile, and presents a most extensive and intricate system of rivers and canals, for irrigation as well as for navigation. By its junction with the Brahmapootra, which descends through the valley of Assam, the river-system of the Ganges becomes double and not unlike that of the great Chinese rivers. The Ganges and the Brahmapootra descend from regions different in natural advantages, of which only that adjacent to the Ganges has attained a high degree of civilization.

The river-system of the Indus has the highest historical interest, partly from containing the Penj-ab, the country of the five rivers, which descend from the eastern mountains, partly from the Cabul, the only important river which joins it on the west, and partly from its geographical position. Flowing along the eastern edge of the table-land of Iran, with a general course from north to south, it forms the true boundary between eastern and western Asia. India, that country which more than any other has attracted the admiration of the philosopher, the cupidity of the conqueror, and the speculations of the merchant, is accessible from the west only by two roads, one of which leading along the valley of the Cabul river, passes through Attock on the Indus to the Penj-ab; the other, which has been less used, leads from Herat through Candahar to Shickarpore near the Indus. The track which leads from the table-land of Iran through Cabul to the narrow terrace on which Peshawer is built, and thence to Attock, is the high-road, along which the nations of Asia for many generations descended in their passage to India, but which never was ascended by the nations of that country. The sources of the Indus have only been discovered in our times (1812), as well as those of its great tributary the Satadru (Setledge); both of them rise on the high table-land of Tibet, the Indus on the slopes of the Kailasa Mountains, and the Satadru in the sacred lake of Manassarovara. These rivers, therefore, do not originate, like the Ganges, on the southern slopes of the Himalaya range, but on its northern descent and the high table-land itself; a fact which till lately was not known. From this circumstance it follows, that these rivers pierce the range in all its breadth, and pass through immense clefts in the

mountain-mass, before they arrive at the low plains of Hindustan. Below the Punjnud (or Pancha-nada, *i. e.*, the five-fold river), which receives all the waters of the Penjab, the Indus, like the Nile, is not enriched by any considerable tributary; and its delta, which was once so famous for its civilization, is at present in a neglected state, and has partially been changed into an uncultivated desert. The whole course of the Indus amounts to upwards of 1500 miles, and it drains a surface of more than 400,000 square miles.

Such are the ten or twelve extensive terraces of eastern Asia, which, differing in their forms and geographical position, and traversed by large river-systems, display a great diversity of natural productions, and have given a different turn to the progress of civilization among the nations which inhabit them. They are partly divided from one another and partly surrounded by the lowlands. But these latter are not flat level countries. Mountain-ridges and table-lands often rise in the middle of them, though they do not attain such a height as those of central Asia. Such a table-land is found in southern China, where it constitutes the mountain-region of Yun-nan, Su-chuan, and Kuang-si; in India beyond the Ganges, where it occupies Laos; and on the peninsula within the Ganges, where the table-land of Deccan is doubtless the most remarkable and at the same time the best known of these subordinate highlands.

This plateau of Deccan occupies with its elevated plains, which at an average rise from 3000 to 4000 feet above the level of the sea, the greatest part of the triangular peninsula between the Arabian sea and the Bay of Bengal. The mountain-range, known by the name of the Ghauts, forms the western edge of the table-land, and descends rapidly to the narrow, rocky, and picturesque coast of Malabar, which is characterized by its numerous harbours. On the northern side, where the Vindhya mountains stand, it sinks in steep terraces extending through the provinces of Malwa and Bundelkund, till it terminates in the flat plain of northern Hindustan. Towards the east its descent is formed by gentle slopes and terraces, as the course of all its rivers shows, which run off from the high plains to the flat and broad, but sultry and arid, coast of Coromandel, which, though surrounded by shoals and without harbours, has become the favourite place of European colonies. This table-land of Deccan is much favoured by nature. Its insulated position is quite independent of the highland of central Asia; it is placed between two seas and in the conflict of the monsoons, and cooled by sea-breezes. Moreover, its surface being formed by a series of terraces, which lie within the tropics, it enjoys all the advantages of tropical countries, without partaking of their disadvantages. On the sultry coast the luxuriance of vegetation is displayed in the cocoa-palm, the mango-tree, the cinnamon-laurel, and the pine-apple; it thence passes through forests of teak-trees to the rice-fields on the table-land of Mysore; and still higher on the cool summits of the mountains it offers to the observer the fruit-trees and grain-fields of Europe, flax-plantations, and rich meadows. It is easy to comprehend, that these numerous and great advantages, rarely if ever so closely united, determined at an early period the civilization of its inhabitants, and impressed on it a peculiar character. Among the three peninsulas with which Asia terminates on the south, and which remind us of the three peninsulas of Europe, Greece, Italy, and Spain, on which civilization made such rapid progress, the peninsula of Deccan has doubtless contributed most to the progress of social improvement. The same advantages are enjoyed by the adjacent island of Ceylon, which resembles the Deccan in the form of its surface, and may be considered as an appendage of it. The similar results arising from the extensive group of the Sunda Islands with respect to the adjacent countries of southern Asia have already been noticed.

We shall now give a general view of Western Asia, the Highland of which, though much smaller in extent, forms the second principal feature in the physical character of this continent. It is not only nearer Europe, but likewise much more akin to it in its natural structure, and for both reasons more closely connected with it in an historical point of view. The form of its surface, less colossal and extensive in its parts, more nearly resembles that of Europe; and the same may be said of its climate and people.

The Highland of Western Asia, which is named the high table-land of Iran, in opposition to the deep plains which are adjacent to it on the north-east, called Turan, has

the figure of a rectangular oblong, extending from the Upper Indus through all Western Asia to the shores of the Grecian Archipelago. Its centre is occupied by Persia; over its western parts extends the dominion of the Turks, and its eastern division contains Afghanistan. It is materially distinguished from the Highland of Eastern Asia by its surface being more generally cultivable, and exhibiting extensive tracts which actually are cultivated, or were so formerly. The latter circumstance is abundantly proved by the numerous ruins of large towns and other monuments of architecture which exist even in those districts which at present are without cultivation; as on the north-east in Khorasan, the ancient kingdom of Bactria, towards the south in Karmania and Persis, and even in the western districts, as in Kurdistan, which formed a part of ancient Media. This observation, however, is not applicable to the south-eastern corner of the Highland, comprehending the ancient provinces of Gedrosia and Arachosia, which at present forms a part of Beluchistan and attains its greatest elevation in the table-land of Kelat, which rises, according to one estimate, to 7000 feet above the level of the sea. Its eastern and extremely rapid descent towards the valley of the river Indus, which is formed by steep rocks and feeds no rivers, is without cultivation and even without roads except one, and only inhabited by savage tribes of Afghan origin who have no historical records. The road alluded to is that from Candahar, through Pisheen, Quetta, and Baugh, to Shickar-poor. (See Conolly's *Overland Journey to India*.)

The northern edge of the Highland, which extends along the southern shores of the Caspian sea and the deep plains of Bucharia, is historically famous for containing the Bactrian, Parthian, Hyrcanian, and Caspian mountain passes, which are narrow defiles, offering a passage for the armies of the conquerors descending from Iran to Turan. This country has for many centuries been the abode of warlike mountain tribes, whose chiefs, by holding possession of the mountain passes on the north, have extended their dominion over the extensive plains of the table-land. This was the policy of Nadir Shah and of Feth Ali Shah, who, sensible of this peculiar circumstance, fixed their residence at Teheran, a town built near one of the passes, on the high table-land. The caravans, which travel eastward to India and Bucharia, and westward by Tauris (Tabreez) to Armenia and Asia Minor, are obliged to pass along the southern side of this mountainous boundary-girdle and near the openings of the passes. Along the great road, which is invariably fixed to this tract by the nature of the surface on the northern boundary of the table-land, there rose numerous great emporiums. Here we find the towns of Cabul, Candahar, Herat, Meshed, Nishapoor, Teheran, Rai (the ancient Rhagæ), Casbin, and Tauris.

The southern border of the table-land of Iran is still more distinctly marked by nature. It is separated from the low and narrow coast and the wide plains watered by the Tigris and Euphrates, by a broad mountain tract, which beginning at the mouth of the Indus extends to the place where the rivers of Mesopotamia, breaking through the rocky masses of the high table-land, enter the low plains. This mountain tract consists of from three to seven ridges, running parallel to one another and separated by as many narrow longitudinal valleys, which sometimes extend many days' journey in length. The ridges themselves are, like the Jura mountains in France, composed of limestone, and rise like terraces from the low coast higher and higher. Beyond them extend the wide table-lands. There are but few mountain passes leading through this natural entrenchment of Persia, a country which on this account may be considered as a fortress erected by nature for the defence of the nations which inhabit it. Among these narrow mountain passes which lead from the sultry low coast called the Gurmsir (warm region) through the great staircase of mountain terraces to the cool table-land in the interior called Sirhud, three roads have acquired some celebrity in history, which we shall notice more particularly under the names of *eastern*, *middle*, and *western mountain road*.

The eastern mountain road begins at the harbour of Bender Abassi or Gambroon, near the entrance of the Gulf of Persia, and leads northward to Kirman, the ancient Karmania, situated on the cool table-land, in a spot which abounds in springs and is covered with fruit trees, though on all sides surrounded by desert plains, in which it lies like an

oasis in the midst of the Libyan Sahara. From Gambroon a road also leads past Lar to Shiraz. (See Herbert's *Travels*, p. 124, &c.)

The middle mountain road begins at the town of Abushehr or Bushire, on the shores of the Persian Gulf, and leads first over a lower ridge to Kazrun, near Shahpoor, the residence of the Sassanides (of king Sapor I., A.D. 240), which is situated in the first valley; from this point it passes over a rocky mountain to Shiraz, once the residence of the Arabian caliphs, which is built in a wider and richer valley; farther through winding mountain roads and narrow ravines to the valley in which the ruins of Persepolis still excite our admiration. From these ruins the road, in a northern direction, again traverses some narrow passes through high rocks, which are full of monuments of the early ages of Persia, till at last it issues out of the mountain region and enters the extensive table-land on which Ispahan, the residence of the Sufi dynasty, is built. The residence-towns of these different dynasties have been built on the fields of battle where signal victories were obtained, and are placed at the openings of the most difficult mountain passes, full of narrow defiles. The Arabs were obliged to pass through this difficult road on their way to Persepolis, and this has likewise been the route of modern travellers who have entered the inland provinces of Persia from the Persian Gulf. The Macedonians, under Alexander, and after them Timur, made their way from the banks of the Karoon to Persepolis up the valley of the Jerahi and by the pass of Kalat-i-Sefid.

The western mountain road which lies to the north-west of the former, may be called the Median, in opposition to the Persian, which passes through Persepolis. Beginning at or near the modern Bagdad, it passes through the Median Pylæ of the mountain range called Zagros, runs by Kermanshaw, Besitoon, and the remains of the temple at Kungavur, and terminates at Hamadan, the ancient Ecbatana in Media. This road, like the preceding, presents many historical monuments, and it crosses the upper course of the rivers which flow through the low lands of Susiana.

Thus a series of towns, the seats of ancient kings, and now the sites of historical monuments, beginning with Kerman and comprehending Persepolis, Parsagadæ (or Parsagarda), Ispahan, and Hamadan, and terminating again at Tauris, lies along the internal slope of mountain ridges which border the table-land of Iran on the south, analogous to that series which we have observed along the northern girdle of the mountain range. By these towns the boundary is marked which separates the region of the natural fastnesses, of the mountain passes, of the battle-fields, of the pastures, and of the country adapted to the chase, which is formed by the mountain terraces, from the interior table-land, which is more level and uniform in its aspect. The table-land itself is traversed by some ridges of hills, which extend mostly in a general direction east and west, and attain only a moderate height above the plain; it is also furrowed by a few valleys, or rather depressions of the surface, which more or less are covered with green meadows, or scanty pastures or steppes, and in a few places with sandy deserts or a soil impregnated with salt.

Fraser, on his route through Persia from Abushehr to Teheran, determined the elevation of many points above the level of the sea, and his statements give a very instructive view of the continually changing surface of Iran. Abushehr is built on the shore of the sea in the sultry Gurmshir, and has a climate favourable to the growth of palms. Kazrun, lying on the first mountain terrace, is 2772 feet above the level of the sea. The highest point of the pass Desht-i-Arjun, above Shiraz, rises to 7200 feet. The town of Shiraz itself, which is built on the second mountain terrace, is 4284 feet above the sea; its climate is favourable to the vine: the roses grow to the size of trees, but the palm does not succeed. The highest point of the pass over the third mountain ridge above Persepolis rises to 6666 feet. Ispahan, lying in the plain which forms the third terrace, is 4140 feet above the sea. From this level the mountain passes lying farther north near Kohrood rise nearly 2000 feet higher. Towards Koom we find the greatest depression in the table-land: here the surface sinks to 2046 feet. It rises again in the plain on which Teheran is built, which has an elevation of 3786 feet. The mountain pass which leads to the Caspian sea past Kishlac, rises to 4572 feet; and the entrance of the Hyrcanian pass at Shahrood to 3414. The Demawend, the highest mountain peak in this

country, attains indeed an elevation of 10,000 feet; but most of the adjacent summits do not rise above 7000. The northern slope of this range towards the Caspian sea is extremely steep and rapid, which is owing not only to the short distance at which that immense lake is situated from the crest of the mountains, but also to the singular fact that its level is more than 300 feet below the surface of the ocean.

The most remarkable and characteristic feature in the surface of Persia is the absence of any considerable river, though this country occupies a space at least equal to that of all Germany. This does not arise from a want of spring water, which is found at no great depth under the surface almost everywhere, and renders this country cultivable in most districts; but it is owing to the want of extensive valleys traversed by running waters. This want has deprived it of an extensive river system, and consequently of the most powerful means provided by nature for a continual progress in civilization. To this circumstance it must be attributed, that the nations inhabiting Iran never got entirely rid of the character peculiar to a pastoral life and the continual change of abode, though it must be admitted that from time to time they have exhibited a considerable degree of mental culture.

At the western extremity of Iran, between the innermost corners of the Gulf of Persia and of the Caspian sea, about the fiftieth meridian, the table-land narrows to nearly half its former extent, but it increases in elevation. To the east of this line extensive plains form the prevalent characteristic, but to the west, mountain masses rise higher and higher. Here begins the alpine region of Persia with Kurdistan, here are the lakes of Urmia and Van, and the sources of the rivers Zab, Tigris, Aras, and Euphrates. The table-land is replaced by mountains, which rise to an enormous height and by elevated valleys between them. Such is Azerbijan, the fire-region, the native country of Zoroaster. On the north-west both the mountain ranges and the table-lands are again united in the compact mountain region and high table-land of Armenia, of which Azerbaijan forms only a lower terrace. The countries of Asia, which extend west of Armenia, resemble in their structure Europe rather than Eastern Asia. The surface no longer presents such compact masses, which rise to a considerable elevation, and extend over a great space; it offers to the view more separated and distinct masses, which form as it were individual limbs. We may distinguish four different divisions of this kind.

The first is the elevated and mountainous table-land of Armenia, which extends in the form of a triangle between the angles of three seas, the Caspian, Black Sea, and the Gulf of Alexandretta. Its plains, on which the town of Erzerum is built, rise to 7000 feet above the level of the sea, according to the measurement of W. G. Browne, at the highest summits of the Ararat, which overtop the plains, attain the height of 17,260 English feet, according to the statement of Parrot.

The second great division is formed by the Caucasus, which is united to Armenia by ridges of moderate height in part covering the Caucasian isthmus. This high mountain region is characterized by its isolated position and its entire independence of the table-lands of Asia as well as by its double descent to the north and south, which renders it much more like the mountain regions of Europe than those of Upper Asia. It may be compared with the alpine region of Switzerland, and is distinguished like that country by its natural productions and the character of its inhabitants, though the rivers which rise in its mountains (Kur, Phas, Kuban, Terek) cannot be compared with those of Europe in length or in importance.

The third separate mass, which lies on the western border of the Highland of Asia, is the peninsula of Anatolia, which on three sides is surrounded by seas, and on the east is joined to Persia by the mountain system of the Taurus. Its interior is occupied by a table-land, which, at an average, perhaps rises to the height of about 2000 feet above the sea, and descends with steep slopes towards the north and the south. Towards the west the descent is gentle, being formed by long fertile valleys traversed by abundant streams, till it terminates on the shores of the Aegean sea in a coast full of promontories and indentations, marking the termination of the ranges which run from east to west in this peninsula. It extends, as we have already observed, like a bridge for the passage of nations between Asia and Europe.

may be compared with the Pyrenean peninsula in many respects. [See ANATOLIA.]

The fourth region, which is connected with the Highland of Western Asia, is formed by the Syrian mountains, which running towards the south contain Mount Libanus, and thence continue to the elevated cone of Mount Sinai, an isolated mountain mass, which is a rare occurrence in Asia.

Western Asia, though indented by gulfs and arms of the sea, which make peninsulas and head-lands, is not favourable to the formation of extensive river systems, which only occur on the eastern side of Asia. Like Europe, it presents forms of less dimensions and more adapted to the dominion of man. Only one extensive river system exists in this country, and this consists of two large rivers; a feature which is peculiarly characteristic of Asia. This is the river system of the Euphrates and Tigris, or of the Shatt-el-Arab; the north branch of the Euphrates comes from near Erzerum, and the east branch from the western extremity of the table-land of Iran, where the country rises to an alpine region, or to a complete mountain system, with diverging ridges and intervening elevated valleys. The Tigris rises on the south side of the high range, along the north side of which the east Euphrates flows. The Euphrates has a winding course of near 1800 miles, measuring along its whole line. When these rivers have forced their way through the Taurus, the Euphrates north of Rumkala, and the Tigris above Mosul, they begin to converge and to surround Mesopotamia, till they approach, but do not actually unite in, the ancient Babylonia. Their waters traverse the same delta, and enter the Persian Gulf by one channel.

We cannot refrain from making an observation on the historical effect of these systems of double rivers in Asia. We find that in the valley of the Nile civilization descended along its banks from one royal residence to another, from Meroë to Thebes, and thence to Memphis and Sais. But in the valleys of the double rivers of Asia we meet with double royal residences, double civilization, and double political systems, as Babylon and Ninive respectively on the Euphrates and Tigris; Delhi and H'Lessa, with Brahmanism and Buddhism, on the river-system of the Ganges; and on the double river-systems of China, the southern and the northern empire, Ma-chin and Khatai. When in the progress of time civilization descended these streams, and met at their conflux, or where they approach near one another, the different degrees of perfection which it had attained, and the different turn it had taken, must have produced, as the nations came in contact with one another, a beneficial effect. The same observation applies to the fourth great system of double rivers, the Sir and Gihon, on the banks of which, in the centre of Asia, the same fact is repeated in the royal residences of Samarkand and Bokhara.

Like the table-land of the Deccan, which forms a projecting, but independent and isolated limb of the highland of Eastern Asia, the peninsula of Arabia projects from the highland of Western Asia, and may be considered as an entirely independent member. As the Deccan is separated from the highland region by the lowland of Sind, so Arabia is divided from the mountain-system of the Taurus by the lowland of Syria, which extends to the S.W. of the Euphrates. On the south of this lowland the country again rises, and assumes quite a different character. This constitutes the highland of Arabia, which, in the form of a trapezium, contains the table-land of Nejd, the native country of the Wahhabites, a cold country, connected on the south with the elevated Yemen or Arabia Felix, which descends in terraces towards two seas. Its descent towards the west is steep, and formed by parallel mountain-ridges, with well-sheltered valleys between them, in which the famous towns of Mecca and Medina are situated. This part of the country is better known than the similar steep descent towards the south between Aden and Hadramaut, and thence to Muscat. The eastern declivity, which appears to descend with a gentle slope towards the Gulf of Persia, and surrounds the islands of Bahrein, noted for their pearl-banks, is no better known. The cold Nejd is the native country of the Arabian horse and the Arabian camel. On the terraces bordering it on the west the mild climate allows plantations of coffee, and the low and narrow coast, with its sultry air, produces, like the Gurmair of Persia, the date-palm, which will not grow either on the table-land of Nejd or on that of Iran.

Arabia exhibits characteristics entirely different from those which mark the other parts of Asia. As already indicated by its geographical position, it forms a point of contact between Asia and Africa, and participates in the distinguishing qualities of both. Even its inhabitants, the original Arabs, resemble no nation so much as the mountaineers of Abyssinia, who inhabit the upper country on the opposite side of the Red Sea, speak a language akin to that of Arabia, and are equally well-formed in their body, and probably nearly equal to them in their mental faculties. The Chinese, confined to their own territory by the nature of the country which surrounds them, and separated from the remainder of the world by seas and mountains, feel no inducement to abandon their fertile and extensive country; they therefore never concerned themselves about other nations, and excluded foreigners from their country. The Hindu, born only for his own Indian world, and fit for no other, placed in a country in which all the advantages with which Asia is gifted by nature are concentrated, early acquired a high degree of civilization; but he has never passed the boundary of his native land, and, with equal indifference, has received all foreigners who have entered the country as conquerors, merchants, colonists, or missionaries. The Arabs, on the other hand, whose native country spreads out between two great divisions of the globe, have assimilated themselves to both, and at one time extended their dominion to the most western point of Africa as well as to that of Asia. By far the greater number of Arabs are dispersed without the peninsula, which is the native country of their nation, but which prepared them for the endurance of every climate. Its sultry coasts resemble, in soil and natural qualities, the arid deserts of Libya; the moderate climate of the terraces approaches that of Deccan, Iran, and Catalonia, and the cold Nejd differs little in its physical character from the highland of Central Asia, on which we find the Arabs dispersed to a great distance from their native country.

We now pass to the third great division which the surface of Asia exhibits, the Lowlands, which everywhere are situated without the highland regions and the valleys formed in the extensive terraces around them. These latter, according to a rough estimate, may occupy a surface of about 4,300,000 square miles, or more than one-fifth of the whole extent of Asia, and consequently there remain about 6,000,000 square miles for the surface of the lowlands. These lowlands lie spread around the more elevated parts of the interior, and occupy countries of great extent along the sea, so that the lower course of the great river-systems traverses these often widely-stretching plains with many great windings and with very little fall. In these plains the great empires, by which the history of this division of the globe is so distinguished, have attained their greatest power, and continued for the longest period of time. The extensive low plains are six in number; they are different in their natural character, and in no way connected with one another.

The first is the great Chinese Lowland on the eastern shore of Asia, along the Pacific Ocean, beginning at Peking and extending along the Yellow Sea or Whang-Hay, southward past Nanking to the province of Kiang-si. Lying south of the 40th parallel, and extending nearly to the tropic, it enjoys a temperate climate, and exhibits the most advanced state of agriculture, the most extensive system of canals, the most active internal navigation, and is the richest and most populous granary in the whole world.

The second is the Indo-Chinese Lowland, which, lying between the Gulf of Tonkin and that of Siam, extends from the tenth degree of north-latitude to the tropic, and comprehends the kingdoms of Camboja and Siam; its northern boundary, however, is not yet ascertained. It unites the advantage of being situated south of the tropic with those of being plentifully provided with water, and it is therefore exceedingly well adapted to the culture of rice. A part of its surface is covered with stagnant water and lakes.

The third is the Lowland of Hindustan, or Sind, which comprehends the northern part of India, and extends in the form of a triangle between the Gulf of Bengal and that of Guzerat. It is bounded by the two river-systems of the Ganges and Indus, and overtopped by three table-lands, those of Tibet, of Iran, and of the Deccan. Being situated out of the torrid zone, but near the tropic, it enjoys all the advantages of a tropical climate, without its disadvantages. None of the lowlands equal it in the richness and variety of the natural scenes which surround it on

all sides; it is no less populous than that of China, which it far exceeds in the number of different nations inhabiting it, and that of royal residences and centres of civilization, (Delhi, Agra, Benares, Calcutta, Lahore, Multan, Ajmeer, &c.) nearly all of which are placed near its centre. In the western half, however, of this region, a narrow tract of land is covered with moveable sand, not unlike the Sahara.

The fourth Lowland is that of Syria and Arabia, which on its eastern extremity is bounded by the innermost corner of the Gulf of Persia, on the west by the mountains of Syria, on the south by the table-land of Nejd, and on the north and north-east by that of Iran. Only its northern half is watered by the river-system of the Euphrates and Tigris, while its southern half suffers much from want of moisture, and presents an arid and desert aspect.

The first two lowlands may be called *maritime*, and the second two *continental*. The Chinese and Indo-Chinese Lowlands are for the most part surrounded by seas, exposed to the continual action of high tides, and frequently drenched by the moisture brought by the winds from the east and south-east. The lowland of Hindustan, and that of Syria and Arabia, on the contrary, border only on narrow bays, and are on the south and on the north overtopped by high table-lands always enjoying a dry atmosphere. Hence it follows, that in the last-mentioned lowlands dryness of the air prevails, as moisture in the former, and that they must be distinguished by all the consequent variations of vegetation and animal life. In China and the peninsula beyond the Ganges the inhabitants approach in their manners and customs the inhabitants of islands; but in India and Babylonia they are like the inhabitants of inland countries. The southern half of the lowland of Syria and Arabia, indeed, resembles the African Sahara, and is therefore called the Arabian Desert. Though situated without the tropic, it displays a tropical nature; and divested of the peculiarities by which Asia is distinguished, it partakes more than any other country of the features which characterize Africa, its arid climate and its natural productions.

The fifth is the northern or Siberian Lowland, which is by far the most extensive of all, occupying more than half the area of all the lowlands of Asia taken together, and extending along the Polar Sea the whole length of the continent from the Ural Mountains to the Pacific Ocean. Though traversed by extensive river-systems, it derives little advantage from this circumstance, as it contains only in the southern third of its surface (between 50° and 60° N. lat.) habitable and cultivable land; this part has been colonized in all its extent by European settlements, the most numerous in Asia. The northern and most extensive district, lying either within the polar circle or near it, is beyond the boundary of the cultivable world, and belongs rather to the polar region than to that division of the globe which has received the name of the East. The Lowland of Siberia, though its maritime boundary exhibits no great variety of forms, has, by its little elevation above the level of the sea, a great influence on the whole continent of Asia, which doubtless would have presented quite a different aspect, if high mountains had risen on the northern shores of Siberia, and formed its boundary towards the Pole.

The sixth Lowland is that of Bucharia, which is entirely continental, not being in contact with any part of the ocean, and only watered by inland seas, the Caspian and the lake of Aral. Its greatest extent is in the direction of the system of the double rivers which traverse it. Beginning at the innermost angle, formed by the western edge of the table-land of Tibet and the northern edge of that of Iran, this greatest of all the depressions on the surface of the globe extends, to the north-west, over the countries adjacent to both banks of the Volga, up to the river Don and the boundary of Europe, between the mountain-ranges of the Ural and of the Caucasus. Thus it may be considered as an intermediate form which connects Central Asia with Europe. Its extensive plains, which are scantily watered, are a kind of mean between sandy deserts and agricultural soil, and their surface is mainly formed of gravel. They are what are commonly called *steppes*—plains covered with grass, and without wood, in which are scattered, like oases, a few tracts of cultivable ground. Such a country is the natural abode of nomadic tribes. Deprived of all natural riches, except in a few places where agriculture is carried on by artificial irrigation and immense labour, and rather characterized by a total want of natural capabilities, this lowland

is very remarkable in an historical point of view. Being placed in the centre of very extensive countries, and surrounded by different nations, it has been involved in all the great historical events: it was here that the conquerors, such as Cyrus and Alexander, who proceeded from the west, or those of China who came from the east, the Bactrians, Ghaznavides, and Great Mogols, who advanced from the south, and the Russians from the north, have found a stop to their farther progress.

The natural poverty of this country, and the comparative richness of those surrounding it, together with the want of fixed abodes, and the various political changes of the neighbouring countries, have frequently induced its inhabitants to pass its natural boundaries. Whilst their neighbours, the Chinese and Hindoos, never left their country, but took root there like plants, and became stationary nations, the inhabitants of this lowland have been, through all centuries, nations of change and migration, who, since the times of the Scythians, Goths, Alans, Uzes, Comanes, Petsheniges, Turks, and Tartars, till nearly our own times, have inundated Europe from time to time, and changed its face by destroying, impairing, or retarding civilization. Their own country, meanwhile, was not exempt from great changes, both as respects the nations which inhabited as well as the dynasties which governed it; and still, in our own times, it exercises a great influence on political events by its geographical position and the obstacles which it opposes to the progress of the three great empires of Asia—the Chinese on the east, the Russians on the north, and the British on the south.

In thus bringing the whole surface of Asia into one view, we find it composed of *six* lowlands, different in their nature, and independent of one another; they spread below and around two highlands occupying an immense space, which themselves are surrounded by seven or eight less extensive and entirely separated mountain or table-land regions: that of southern China, the peninsula without the Ganges, Deccan, Arabia, Syria, Armenia, and the isthmus of the Caucasus,—all of which exhibit peculiar features, by which the countries surrounding them are characterized, in the same manner as the great highlands characterize the whole continent. If we add to their number ten or twelve intermediate formations, constituting the terrace-regions, we have nearly a score and a half of great natural divisions on the surface of Asia, of which every one is subject to its peculiar natural laws, presents its peculiar natural appearance, and maintains a distinct character. Considerations on their mutual connexion and reciprocal influence alone can afford us a true view of the infinite variety and combination in the natural phenomena and the historical events of that great division of the globe, to which both the records of history and the laws of nature have induced us to assign the common name of Asia.

Minerals. Precious Stones.—Rock-crystal in the greatest variety, amethysts in the Altai, Himalaya, and Ural mountains; carnelians, agates, in western India, and in the Gobi desert; casholongs and onyxes, in Mongolia; yu, or oriental jade, in Turkistan; different kinds of jasper, in the Altai mountains; pearl-stone, marcasit, on the shores of the Gulf of Okhotzk; beryl, in the mountains near the lake of Baikal; lapis lazuli, in the same mountains, as well as in the Hindu Coosh, and on the banks of the Oxus; topazes, in the Ural mountains; circony, chrysoberyl, sapphires, on the island of Ceylon; rubies, in Ceylon and in Badakshan; turquoises, in Khorasan; diamonds, in Deccan, Borneo, and the Ural mountains.

Volcanic products are met with on the Sunda Islands, in Japan, and Kamtschatka, in the neighbourhood of Tauris, and many parts of the highland of Armenia, and in western Anatolia.

Steatite, earth-flax, asbestos, and coal, or the finest porcelain-clay, are found in China and Japan; talc in Siberia: coals in northern China, and different parts of Hindustan: rock-salt in the Ural mountains, northern China, the Penj-ab, Ajmeer, Yemen, Anatolia; salt in the salt-seas of the steppes, and sometimes on the surface of the ground; sal-ammoniac in the volcanic steppes of Central Asia, not far from the river Ili; nitre in Hindustan; borax, or tiqual, in Tibet; petroleum, near Baku, on the shores of the Caspian Sea, on the Euphrates at Hit, and other places, and at Kerkook east of the Tigris; asphaltum on the Dead Sea, in Palestine. Hot springs are very abundant in the snow-covered ranges of the Himalaya range, especially along the

upper branches of the Ganges, and in the N.W. of Anatolia.

Metals.—Gold in Japan, Tibet, Yun-nan, Cochin China, Tonkin, Siam, Malacca, Borneo, Asam, Ava, and in the Ural mountains; many rivers bring down gold in their sands; silver in China, Da-uria, Japan, Armenia, Anatolia, and the Ural mountains; tin in Malacca, Anam, the Sunda Islands, and the empire of the Birmans; mercury in China, Japan, and Tibet; copper in the Ural and Altai mountains, Japan, China, Nepal, Azerbaijan, Armenia, and Mount Taurus; malachite in China and Siberia; iron from the Ural mountains, through central Asia as far as the Peninsula beyond the Ganges, as well as in Japan and Persia; lead in Da-uria, China, Siam, Japan, Georgia, and Armenia.

Extensive layers of fossil shell-fish are found on the highest table-lands of Tibet, from 16,000 to 18,000 feet above the sea, and the strata of the tertiary formation in Siberia are full of animal remains of the old world, as the elephant, mammoth, rhinoceros, &c.

V. The Man of Asia.—As Asia is the most extensive of the great divisions of the globe, it is likewise far superior to the rest, if we consider the number of its inhabitants, their variety, and historical fame. Upwards of 400 millions are dispersed over its surface; consequently, twice as many as the inhabitants of Europe, and more than eight times that of the inhabitants of America, which continent in its area approaches nearer to Asia than any other.

Many questions may be raised respecting the population of Asia. It may be asked, whether or not that continent was ever more populous than at present? How many of its inhabitants were destroyed during the wars of the Mongols? How far has its population decreased, owing to the despotism exercised by the Turks in the western countries? How many nations have already become entirely extinct, or exist in very small numbers, as the Philistines, the Phœnicians, the Babylonians, the Parsees, the Lydians, the Bactrians, the Medes, the Sogdiani? More than forty nations were destroyed in the middle age by the Mongol wars, according to the statements of the annalists of that time; and some have become nearly extinct in our times, as the Doms in the Himalaya range, the Miao-tse in southern China, the Tata in northern China, the tribes of the Tunguses, eastern Turks, and Samoiedes in the mountains of Sayansk, and others in Mount Caucasus. These questions cannot be answered with any degree of probability.

But we may safely assert that the number of foreigners who have settled in Asia is extremely small, compared with the numbers who have left it to inhabit other divisions of the globe. We may estimate the number of Europeans in India at a hundred thousand, those settled in Siberia, the descendants of the Cosacks included, at two millions, which probably exceeds the truth; and the Greeks of European origin, inhabiting Anatolia, at one million and a half, or even two, though these Greeks have long ago been changed into Asiatics. Few settlers have gone to Asia from Africa and America, and still fewer from Australia. The Egyptians never settled in Asia, but the Arabs settled in Egypt. Negro slaves are dispersed over Persia, Arabia, and Hindustan, but they are few in number. Abyssinians indeed, from time to time, entered Asia in crowds; they came, however, not as a nation, but as mercenary soldiers in the service of Arab emirs or of Indian rajas; and their descendants, like those of the Portuguese, have entirely merged in the native population. America, at all events, has not much increased the population of Asia: the Tchukches, on the most north-eastern peninsula of Asia, who belong to the family of the Esquimaux, as the affinity of their language induces us to suppose, have perhaps not passed the sea into Asia, but are rather aborigines of Asia.

Thus we find Asia, like all other large divisions of the globe at the present day, inhabited by aborigines and foreigners, the two great divisions of mankind in an historical point of view. Asia has been the principal country from which emigration has spread, so far as the history of man is known: it has been the parent of nations who have left its bosom, to form, in other countries, a new character of social life.

If we consider the inhabitants of Asia according to the physical division of three principal races, the white (or Caucasian), the yellow (or Mongolian), and the black (or Ethiopian), and three intermediate races, namely the dark brown (or Malay), the negro-like (or Papuas, also called Austral

negroes), and the copper-coloured (or American), we find that the greatest number of these races, and of those nations which connect them, are dispersed over the surface of this continent. They cannot always be exactly distinguished by the form of the skull, the hair, or the complexion of their skin. The three principal races border on one another in the elevated valleys of Central Asia, where the skulls of the Cashmirians show their Caucasian origin; whilst those of the Bhots, or inhabitants of Bhotan and Tibet, are Mongolic, and between them the skull of the negroes is found, if it be true, according to the observations of Traill, that the nearly extinct slave-tribe of the Doms, in the valleys of Kamaoon, belongs to the dark-coloured and woolly-haired race of the negroes. But perhaps these Doms are only the most northern representatives of the Austral negroes, which are dispersed through the peninsula beyond the Ganges and the Sunda Islands, as well as in the adjacent islands of Australia as far as New Guinea, and which, since they have become known, have been constantly called Papuas. By Cuvier they are enumerated among those tribes which have separated from the true negroes. The Malay race in their neighbourhood inhabits the island of Sumatra and the peninsula of Malacca. All the races enumerated are found in Asia, except the copper-coloured races of America; the Caucasian prevails from the centre of the continent toward the west and north-west, and the Mongolian likewise from the centre towards the east and north-east.

We shall not pursue further that division of the nations of Asia which is derived from the history and the genealogy of the different tribes, nor that which depends on their physical character, but rather follow that which results from the spoken languages. But we must also observe, that these three points do not always exactly coincide, and that many difficulties are still to be solved by further investigation. Still we think that the division which rests on the internal structure of the languages, is, as far as the investigation of this matter has been carried, the most certain and safest, and that the nearer or remoter kindred which exists between different nations may in some measure be indicated by it. Adopting, therefore, the division of nations according to their languages, the following groups may be enumerated in Asia.

The first in the order of historical importance is the Semitic nations. These are the Syrians and the Chaldeans, or the ancient Arameans; the Phœnicians—though the number of the pure and unmixed families belonging to this people may be very small—probably still exist in their ancient country, especially near the Libanus; the Jews, who from Palestine have been dispersed over all Asia as far as the coast of Malabar and the northern provinces of China; the Arabs, who are the most numerous of this race and less mixed with other nations, are dispersed through all western Asia as far as the mouths of the Indus and the sources of the Oxus.

It has only recently been demonstrated that the languages spoken by the aborigines of the countries on the Ganges and Indus, and even the peninsula within the Ganges, as well as those of Persia, and farther to the north-west the nations of Europe, as the Slaves, and those of German origin in the west and centre of Europe, display a great affinity in the grammatical structure as well as in the roots of numerous words. To this group belong the inhabitants of India, who speak the numerous dialects or languages derived from or connected with the Sanscrit. This remark applies also to the nations of Iran, as the Persians, perhaps the Kurdes, Beluchas, Gipsies, and even the Bucharians, &c., though many of them have been mixed with other nations of Turkish, Mongolic, or Arabic origin. Besides these we must enumerate the Ossetes (or Iron, the descendants of the Alans) in Mount Caucasus, and some nations of Slavish origin inhabiting Asia, as well as the greatest number of the inhabitants of Europe.

The Armenians either belong to this group, or constitute a separate one. But the researches on the grammatical structure of their language have not yet been carried far enough to determine this point with any degree of certainty. From the mountainous table-land which is their native country they have been dispersed through the central and southern countries of Asia as far as China, and may in this respect be compared with the Arabs. The latter indeed are also met with in Africa, but the Armenians are found in Europe even as far as the middle course of the Danube river, but everywhere only as pacific settlers.

The Georgians form a separate group, inhabiting the Caucasian isthmus, between Mount Caucasus and the river Kur; besides the proper Georgians in Imerethi, three branches belong to it, the Mingrelians, Suanes, and the Lazes: the latter occupy the eastern shores of the Black Sea, and are the descendants of the ancient Colchi.

Different from them are the nations which inhabit the Caucasus as aborigines, and not as an adventitious people. They are divided into three principal tribes, the eastern Caucasians or Lesghians, the middle Caucasians or Mitsdjekhes, also called Chekhes, and the western Caucasians or the Chercassians and Abassis, all of which are again divided into different smaller tribes, as is usual among mountaineers.

The Turkish nations form one of the most extensive groups. The greatest number of them occupy Central Asia, beginning on the east with the table-land of the Gobi of Hami, and the countries about the lake of Lop, and extending to the west through Turkistan, where they are called eastern Turks. Farther to the west, in the low land about the lake of Aral, they receive the name of Turkomans; and still farther in Asia Minor, and in the Ottoman empire of Europe, they are named Turks or Osmanlis. These nations may be considered as the principal stock of this great division, but its branches extend to the north and to the south between other nations of Mongolic or Persian origin, and are manifoldly interwoven and mixed with them; and although the physical structure of their body sometimes may display the most remarkable differences, these nations, from Pekin to Constantinople, speak dialects (called by us the Turk-Tartarian dialects) which are understood by all of them. The Turkomans or Truchmenes, a pastoral nation, divided into innumerable tribes, form the principal stock of the inhabitants of northern Persia, on the west side of the Caspian Sea, in Shirwan, Asia Minor, Khiva, and Bucharia, where a tribe of the eastern Turks, who are the original inhabitants of the centre of the table-land of eastern Asia (in Khotan, Yarkand, Turfan, Kashghar), under the name of the Usbeks, have obtained the dominion of Turkistan and Bucharia. The Kirghises were formerly under the name of eastern Kerkis (Kazak or Hakas), the neighbours of the Mongols, and inhabited the upper course of the Yenesei and the Altai mountains, but they have been obliged to emigrate towards the west, where they occupy at present as pastoral tribes the steppes, which have received from them the name of the *Steppes of the great, middle, and little Kirghis tribes*. The Bashkires are settled in the southern branches of the Ural mountains. Besides these, many other nations and tribes, which commonly are called Turkish Tartarian, or Tartarian Siberian, or only Tartarian tribes speak Turkish dialects, though some of them have been mixed with Mongolic tribes. Among these may be enumerated the Nogai on the banks of the Kuban and Kuma near Mount Caucasus, who partly occupy also the Crimea in Europe; the Kumuks in the same country; the Karakalpaks near the lake of Aral; many tribes commonly called Tartars settled in Siberia, between Tobolsk and Yeneseisk; the Barabinses wandering about on the steppe of Baraba, the Kusnes on the river Tom; the Katshinzes, Belytyres and Biruses in the mountains of Sayansk and the banks of the Upper Yenesei; the Teleutes, about the lake of Teletzkoi, and lastly the Yakutes, who form the extreme link of the Turkish nations towards the north-east, and occupy the banks of the middle course of the river Lena about Yakutzk, and even extend to the mouth of that river.

The nations of Samoiedic origin occupy two different countries distant from one another. The southern division inhabits the banks of the Upper Yenesei and the mountains of Sayansk, where the remnants of the formerly very numerous Samoiedic nations have remained in that country, of which they were the aborigines; they are divided into four tribes, the Uriankhai (or Soyot of the Chinese), the Motores, the Koibales, and the Karakashes. The northern division is settled along the Polar Sea to the north of the Lower Tunguska, and extends from the mouth of the river Yenesei to that of the Oby, and farther west to the northern part of the Ural mountains, and even in Europe as far as the White Sea; so that these tribes, which properly are called Samoiedes, are separated from the other above-named branches of their family by Turkish tribes and the Yeneseians, who inhabit the country lying between them.

The Yeneseians are an isolated and small tribe, whose abode is confined to the valley of the river Yenesei in its middle course between Abakansk and Turukhansk, and who formerly, like their neighbours the Samoiedes, inhabited the mountains of Sayansk and of the Altai-ange, but like them were obliged to emigrate towards the north, when other nations which lived in their neighbourhood began to press upon them with superior force—an event which seems to have been extremely common in the countries in the north and north-west of Asia.

The nations of Finnic origin belong less to Asia than to Europe, where they are dispersed from the western declivity of the Ural mountains through the valley of the Upper Volga, as far as Lapland. Two tribes of this origin are found in Asia, the Vogules and the Ostiaks of the Oby river, who may be comprehended under the general name of Eastern Finns; they occupy the country extending from the Ural mountains eastward to the middle course of the Oby, so that they separate the northern Samoiedes from the Turkish tribes inhabiting the western districts of Siberia farther to the south.

The Mongolic stock of nations branches out into three great divisions—the proper Mongols, the Buriates, and the Olöt or Kalmucks. The proper Mongols are settled on the southern side of the desert of Gobi as tribes charged with the defence of the boundary of the Chinese empire, and there they are called Tsakhar, whilst other tribes, comprehended under the name of Khalka, occupy the northern side of the Gobi. Other tribes farther to the south-west, towards Tangut and Tibet, are known under the general name of Sharaigol or Khor among the inhabitants of Tibet, also Sokbo, i. e. pastoral tribes. The greatest number of them depend on the court of Peking, and are distributed under different banners; a small number however are under the dominion of the Russians, in the countries surrounding the lake of Baikal, which likewise is inhabited by the second great branch of the Mongolic nations, the Buriates, who seem to have kept possession of their original native country. The third great branch of this extensive stock, the Olöth, who are dispersed over all the countries between the lake of Khukhu-Nor and the banks of the Volga, are again divided into four branches, and are known in Europe by the name of Calmucks (Kalmakh), which was given to them by the Russians. The most extensive of these branches was once formed by the Zungares, who in the middle of the last century (1757), in their war with the Chinese, were partly destroyed, and their original country on the banks of the river Ili and of the lake of Balkash, on the south-west of the Altai mountains, which for some time had been entirely uninhabited, though it contains extensive pastures, was afterwards occupied by another branch of the Olöt, the Turgut, whose tribes had till then been settled on the banks of the Volga to the north of Astrakhan. But some of their tribes remained on the banks of the Volga, and others are dispersed through Central Asia, as far as the lake of Khukhu-Nor. The third principal branch of the Olöt, the Khod, are less numerous, and inhabit likewise the country surrounding the lake of Khukhu-Nor or the Blue lake. The fourth great branch of these Mongols, the Turbet, are settled still farther to the east, on the upper course of the Hoang-Ho.

The Tungoose form one of the most extensive families of nations in the north-eastern countries of Asia, occupying all that part which lies to the east of the northern Samoiedes on the Polar Sea, of the Yeneseians, of the Uriankhai on the upper course of the Yenesei river and on the mountains of Sayansk, and to the north-east of the Mongolic tribes. From the upper course of both Tunguskas they extend to the Polar Sea and the river Olenek, and thence over the middle course of the river Lena, and from the eastern extremity of the lake of Baikal over the river Wura as far as the shores of the Gulf of Okhotsk, where they are called Lamutes, or inhabitants of the shore. Towards the south-east they occupy the countries lying on the middle course of the Amur or Saghalien Oola and the banks of the Sungari Oola to the boundary of the peninsula of Korea. But neither at the mouth of the Amur, nor farther to the south, do the Tungoose extend to the shores of the sea, the latter being inhabited by the Aino, a tribe not belonging to this stock. The branches of the Tungoose are very numerous, but in modern times none of them has rendered itself conspicuous except that tribe which occupies the south-

eastern corner of the country inhabited by them, and is called Mantchoo, which conquered China in the middle of the seventeenth century, and still governs that country. These Mantchoo Tungoses are found dispersed over all the provinces of the Chinese empire, where they constitute the military nobility.

The north-eastern part of Asia from the mouth of the Lena river to the sea between Asia and America is occupied by three nations, who speak quite different languages, though they live near one another on a country of comparatively no great extent. These nations are the Yookaghires, on both banks of the Indighirka; the Koriakes, from the Kowyma river to the Anadyr river, and round the Gulf of Peshinsk; and the Tchuktches, inhabiting the most north-eastern extremity of Asia. Between the latter and the Eskimaux tribes in North America such an affinity exists, as to language, that they have obtained the name of Polar Americans. The Kamtchadales too, who have given to, or received their name, from the peninsula which they inhabit, form a separate group of nations, speaking a peculiar language.

The tribes which are comprehended under the name of Kuriles, or Aino, are placed to the east of the Tungoses, or more exactly at the mouth of the Amur river and on the coast which extends to the south as far as Corea; they inhabit likewise the islands lying along this coast and extending southward to Yesso on the north of Japan, and northward under the name of Kuriles to the southern cape of Kamtchatka. Though these fishing tribes are dispersed over a very extensive coast, they have a common language.

The Japanese speak a language peculiar to themselves; and though their civilization exhibits a striking similarity to that of the Chinese, it seems not to have been influenced by the latter, but to have risen entirely from the peculiar character of the Japanese. Both their language and their civilization are confined to their islands, with the exception of the islands of Liew-kiew, whose inhabitants certainly belong to the same stock, but their language is said to be different.

The Coreans, or inhabitants of the peninsula of Corea, constitute likewise a separate nation, which many centuries ago inhabited the mountain-range which forms the northern boundary of the peninsula, and then were called Siānpī; at present they are confined to the peninsula itself by their neighbours, the Mantchoo, who occupy the country farther north, and are quite different from them.

The Chinese constitute the most numerous and most civilized nation of eastern Asia, forming by far the greatest part of the population of China itself, and possessing a very rich literature. They are also dispersed over the other countries subject to the court of Peking, and even beyond this boundary, where, however, they have only settled in more modern times. They have likewise formed many settlements on the island of Formosa, as well as on the Sunda islands, in Siam, Malacca, and in Ceylon.

The Tibetans, or inhabitants of Tibet, who call themselves Bhot or Bhota, constitute a very numerous group of tribes, which are far dispersed over the table-lands of eastern Asia, to the north of the Himalaya mountains, but all of them are very little known; it seems, however, that they are divided into many branches extending to the west, east, and north-east.

The different nations which occupy the peninsula without the Ganges, as the inhabitants of Anam, i. e. of Tonkin and Cochinchina, those of Siam, Pegu, and Ava, or the Birmanians, are still very imperfectly known; their languages, history, and peculiar manners and character have only of late years become an object of inquiry. The Malays are better known; they perhaps once occupied the mountain region of the peninsula of Malacca, but at present are only settled on the Sunda islands and the southern extremity of that peninsula. They speak a distinct and cultivated idiom, which is far diffused, on the west as far as Madagascar, and on the east over the islands of Sunda and the Philippines, and even to the most eastern island groups of the Pacific Ocean.

These are the principal groups of nations inhabiting Asia; but in the inland countries of that continent there still exist some feeble remains of ancient nations which have not yet been subjected to a close investigation. Such are the Miao-tse in southern China, the Goands in Deccan, the Lolo and Carayn on the peninsula beyond the Ganges,

the Siapush in the Hindu-Coosh mountains, and some others.

VII. *Political divisions.*—As nearly everything belonging to the geography of Asia appears to be formed on a colossal scale, the political relations of the different states which have taken possession of its extensive natural divisions are the same. We may state with certainty that at present there are only six empires of great power and importance which possess among them the whole continent. The others, of less extent and importance, are either dependent on these six, or at least are subordinate, and rendered of less political weight, from being separated from each other by the six. The east of Asia is occupied by the Chinese empire, the north by Russia, and the south by the British dominions; the other states lying between them, as the empire of the Birmanians, and the kingdoms of Siam and Cochinchina, are only of the second or third rank. The west of Asia, however, comprehends Persia, which is now divided into two states, Afghanistan (eastern Persia), and Persia Proper (western Persia), Turkey and Arabia; and if we except the small states of Khiva and Bucharia in the low lands round the lake of Aral, there hardly exists an independent nation or sovereign of any weight in political matters. The area, as well as the population and the physical resources of Asia, are very unequally divided amongst those great monarchies.

Asia, according to an approximate estimate, contains from nineteen to nineteen and a half millions of square miles, including the islands, which occupy nearly one million and a half of square miles, or more than one third of the surface of Europe. If we further subtract the extensive lakes, as the Caspian Sea and the lakes of Aral, Baikal, and Balkash, which together occupy a surface of upwards of 200,000 miles, we find that the whole surface of continental Asia is reduced to about seventeen millions and a half, which may be supposed to be inhabited by from 450 to 500 millions of souls. Europe, which, according to a rough estimate, contains upwards of three millions of square miles, is inhabited by about 180 millions of souls; therefore, though Europe contains only about one-sixth of the surface of Asia, its population is equal to more than one-third of that of the latter continent. But political importance depends entirely on wealth and population, and not on the great extent of countries. Very extensive tracts, which are possessed by the two largest monarchies of Asia, are very thinly inhabited, whilst other portions of that continent have an excessively dense population, which gives them great weight in their political relations with the neighbouring nations.

The Russian empire extends through two of the great divisions of the globe, from the Atlantic Sea to the Pacific Ocean, and contains about 7,400,000 square miles, with a population of about 55 millions; more than two-thirds of its surface, namely, 5,800,000 square miles, and only one-fifth of its population, namely 11 millions, belong to Asia. In this account are included the ancient Tartarian kingdoms of Kasan and Astrakhan, which by some geographers are assigned to Europe, and the wandering tribes of the Kirghises, which are estimated at 300,000, and the mountaineers of the Caucasus, at about half a million. Besides the two great Tartarian kingdoms of Kasan (the ancient Bulgar), and Astrakhan (the ancient Kaptshak), the Russian empire in Asia contains Siberia, the eastern boundary of which is not exactly fixed; the Caucasian provinces, three in number, which lie on both sides of Mount Caucasus and constitute a military government; the steppes of the Kirghises, a protected country; and the Siberian islands and peninsulas in the Polar region of the Pacific Ocean, as far as the north-western shores of North America. Up to the year 1822 Siberia was only under the orders of military governors: but at that period it was placed under a civil government, and divided into two great provinces or general governments, namely, Western Siberia, which comprehends the governments of Tobolsk, Omsk, and Tomsk; and Eastern Siberia, to which belong the governments of Irkutsk, Yeneseisk, and Yakutsk, with the two maritime governments of Okhotsk and Kamtchatka; and it is observed that, since this change has taken place, the settlement of European colonies through Northern Asia, to the east of the Ural mountains, has considerably increased.

The Chinese empire is limited to one of the great divisions of the globe—Asia, but it comprehends more than one-fourth of its surface, namely, upwards of five millions

of square miles, with a population amounting at least to 235 millions; but if we may rely on the population list published by the court of Peking in the great imperial geography, the whole population of the empire in 1813 amounted to 361,703,110 individuals, consequently upwards of a hundred millions more than we have supposed. Its extent is greater than that of all Europe by nearly two millions of square miles, and its population is nearly double that of Europe, if we follow the statement of the Chinese government, or is equal to it and the whole population of the Russian empire in addition, if we follow the more moderate supposition. The subjects of the Russian emperor in Asia do not exceed 1-40th of the whole population of that continent, but those who obey the Emperor of China may be considered as constituting one half of all its inhabitants. Though, therefore, both these empires are nearly equal in extent, the amount of their population is widely different, and the Russian empire occupies a very subordinate political relation. China occupies the first place among the political bodies of Asia, and in this position it has maintained itself for two thousand years, whilst the power of Russia does not yet reckon two hundred. But every part of the immense surface of the Chinese empire is not of equal importance. In the Russian empire the Ural mountains are the natural boundary of its body, whose head is placed in Europe, but whose limbs extend through the whole north of Asia as far as Kamtchatka, and are a mere appendage, which adds very little to the internal force of the body. Nearly the same circumstances exist in China. The head of the Chinese empire is at a short distance from the Pacific Ocean, on the eastern side of the table-lands of the Gobi and of Tibet, in the rich and fertile and densely-populated lowlands of China, or in that part which is properly called China (Chin). But all the other provinces to the north of the Great Wall and to the west of its western extremity, must be considered as an appendage, which is of comparatively very little political importance with regard to the whole empire. By some event this union might be dissolved, and the exterior limbs separated, which has actually taken place more than once on the change of the reigning dynasties; but such events have not injured the proper body of the empire, which has rather attained a greater concentration of its internal forces by this separation. These external provinces or intermediate countries are only of importance to the government by impeding foreigners (*i. e.* barbarians, called *fan*) from entering into immediate intercourse with the natives of the Celestial Empire, and as a barrier against the more western empires and nations (Si-yu, Si-fan). As provinces of inferior political importance, but forming an impenetrable barrier to intercourse with the neighbouring nations, we must consider all the countries extending over the Chinese table-lands, the boundaries of which are nearly coincident with those of the highlands of eastern Asia. The Chinese empire accordingly comprehends five great divisions of countries, besides some of less extent; and with respect to their political relation towards the government, they may be divided into three classes. The first class comprehends China Proper alone, the permanent seat of government and the residence of the sovereigns, either in the southern capital (Nan-king), or in the northern (Pe-king), as at present. The second class is composed of three great kingdoms, subject to the court of Peking,—Mantchooria on the north-east, the native country of the present dynasty, which is of Tungoose origin; Mongolia on the north and north-west, or the native country of all Mongolic tribes; and Hami, Turfan, Khotan, Yarkend, Kashghar, and the mountainous Bucharra, or rather Chinese Turkistan, which are properly the native countries of the eastern Turkish Tartarian tribes. The third class is composed of the protected countries, which have only in part received Chinese institutions, such as Tibet, Bhotan, Undes, Ladakh, and other small countries on the table-lands towards the south and west; and on the east the peninsula of Corea and the island of Formosa, as well as the Liquejos or Liew-kiew islands.

The *British dominions in the East Indies* are, for the most part, in India, or the peninsula within the Ganges, a country which is little less than half the surface of Europe, and has a population inferior to that of Europe by only about fifty millions, so that, though only half as large as Europe, India has nearly three-fourths of its inhabitants. Were the whole population of the Russian empire in Asia uni-

formly and equally distributed over the country, every square mile would be inhabited only by two individuals: the same calculation, applied to the whole Chinese empire, would assign to every square mile somewhat more than forty-six persons; but in India, more than double that number. This circumstance is of great moment in the political balance in favour of the British dominion, especially as their possessions comprehend those parts of the peninsula which are the most densely peopled, and in which agriculture and civilization have made most progress; whilst the dominion of the Chinese extends over many countries, inhabited by wandering nomadic tribes, still sunk in barbarism. If we consider only the immediate possessions of the British in India, excluding even the island of Ceylon, we find that they have a population of from seventy to eighty millions on a surface little exceeding 650,000 square miles; but their political importance can only be duly estimated, if we consider how this population is concentrated, and how easily accessible these countries are by sea and the great navigable rivers. To this we may add, the security which the peninsula derives from being in the hands of a nation possessing the most powerful navy in the world. But the British influence is not limited to the immediate possessions of the three presidencies of Calcutta, Madras, and Bombay; it extends over a great number of dependent and protected sovereigns, who possess a territory as large as that of the East India Company, and, taken together, probably not less than forty millions of subjects. The whole number of such rajas and nawaubs exceeds forty, and some of them possess countries of considerable extent, as the monarchs of Oude, of Nagpoor, Mysore, Satarah, Travancore, and the Nizam of Golconda. To these we must add the island of Ceylon, which belongs to the crown, and is of the greatest importance as a well-situated and convenient station for the navy. The countries which are still entirely independent of British influence are situated on the extreme boundary of India, as the government of the Sikhs, and the alpine state of Nepal, both on the northern limits of the British possessions. The territories of Runjeet Singh extend from the Settledge to the Indus, and from Cashmere to Mooltan, comprising the whole of the countries of the Penjab: under him the Sikh nation has changed from a republic to an absolute monarchy. One sovereign only at present exists within the boundary of these territories, who may still lay claim to independence, the Maharaja Sindiah, a Mahratta prince, whose possessions, everywhere surrounded by the British dominions, extend to the north of the table-land of Deccan. But all these independent states are subordinate as to power and influence; they comprehend less than 200,000 square miles of surface, with a population short of ten millions. By the peace concluded at the termination of the Burmese war (1826), the possessions of the Company have been increased, by the acquisition of Aracan, with upwards of 20,000 square miles, and a population of about 200,000 souls, and of the more southern maritime provinces of Ye, Tavoy, and Mergui, with a surface of more than 30,000 square miles, but a very scanty population, not exceeding 35,000 persons. But nevertheless the possession of the latter country is important, by securing to the British nation the dominion over the gulf of Bengal and the straits of the Sunda islands.

The *Portuguese*, whose settlements were formerly so numerous on the coasts and in the islands of the Indian Sea, have preserved Goa, with a few adjacent places, Daman, and a small portion of the peninsula of Guzerat, with the fortress of Diu, a place important for the construction of vessels. These possessions, together with the island of Macao, in the bay of Canton in China, and some small districts of the island of Timor, are supposed to contain about 30,000 square miles, and half a million of inhabitants.

The *French* settlements in Asia are confined to India, and comprehend the governments of Pondicherry, with the towns of Pondicherry and Carical, on the coast of Coromandel, and a few other places, among which Chandernagor, in Bengal, and Mahé, on the coast of Malabar, are the most important. The whole area possessed by the French does not exceed 450 square miles, with a population of 200,000 individuals.

The *Danish* colonies consist only of the town of Tranquebar, and its territory, on the coast of Coromandel, a place remarkable for the influence which the missionary establish-

ment of the Protestant creed, which was erected here more early than in other places, exercised on the neighbourhood. The Danes have also a small settlement at Serampore, on the Ganges.

The settlements of the *Dutch* were formerly dispersed over the coasts of both peninsulas of India, as well as over the adjacent islands; but they were obliged to abandon them by degrees; and since 1821 they have been limited to the islands. Their power begins on the west with Sumatra, and extends over Java, as far as the Moluccas, or Spice Islands. These possessions comprehend a surface of about 86,000 square miles, and a population of perhaps five millions. They are divided into seven governments: Batavia, with the seat of the general governor, and Sumatra, Amboyna, Banda, Ternate, Macassar, and Timor.

These are the great empires and the colonies of the European nations, among which the north, east, south, and centre of Asia is divided; but besides these, there still exist some sovereignties, which, though not powerful enough to influence materially the political affairs of that continent, possess considerable importance in their immediate neighbourhood. Such are the empire of Ava or Birma, with a surface of perhaps more than 250,000 square miles, and a population of fourteen millions; the kingdom of Asam, with about a million of inhabitants, whose raja, however, is dependent on the British in Calcutta; and in its neighbourhood, a few small states in the mountains, as that of the Garrows, Munipore, Cashar, &c.; farther, the kingdoms of Siam and Annam, which latter comprehends the ancient sovereignties of Cambodia, Cochin China, and Tonkin, some petty but independent princes on the peninsula of Malacca, on which the British only possess the town and harbour of Singapore, with its annexed territory, and about 30,000 inhabitants, and a great number of petty sovereignties on the Sunda islands. Still we have to notice the most eastern of all Asiatic countries, Japan, which consists of many islands, comprehending an area of more than 200,000 square miles, with a very dense population, estimated at twenty-five millions.

The political relations of western Asia are quite distinct from those of its eastern countries. Other political bodies are here predominant. The influence of the British on the south, and that of the Russians on the north, is here only subordinate; and the empire of China has no weight at all. In the lowlands, on the banks of the Gihon and Sir Darya, political power is subject to continual changes and divisions, which put a limit to the extension of the influence of the Chinese empire, though it projects like a wedge between Siberia on the north and India on the south. This territory of the nomadic tribes, with its agriculture dispersed in the fashion of oases, is probably the country of the Massagetae of the ancients, the Khorasmia and Mawar-al-Nahar of the Arabs, the Zagatai of the Mongols in the middle ages, and contains at present the states of Bokhara, or Usbekistan, and Khiwa, each of which may comprehend about 100,000 square miles; and besides these, many petty sovereignties in the mountain regions, as Khokan, Badakshan, Turkistan, Tashkend, &c. All these countries must be considered as placed without the political relations of eastern, as well as of western Asia, and cannot be enumerated among the civilized kingdoms, which have attained a fixed and determinate form of government.

The nations whose power is prevalent in western Asia are the Persians, the Arabs, and the Turks. Persia, which occupies the centre, would doubtless exercise a decisive influence, if it still formed one entire and undivided empire; but for more than half a century this country has been divided into two sovereignties, Eastern Persia, or Afghanistan, and Western Persia, or Persia Proper, nearly equal in extent, and each comprehending upwards of 500,000 square miles. But their population is still more unequal: Western Persia contains about nine millions of inhabitants, but Afghanistan probably does not exceed seven. The political power of the latter is besides diminished by its southern portion, called Beluchistan, which comprehends half of its surface, and perhaps one-third of its population, being placed under the sway of its own sovereign, and still further by having lost nearly entirely some of its provinces, as Herat on the west, and Cashmere on the east, which at present are united to it by very slender bonds. Both countries however, Persia Proper and Afghanistan, preserve the importance which is secured to them by their geographical situation, as being the countries through which the commercial intercourse between eastern and western Asia is carried

on, which influence is still considerably increased by their being placed between the dominions of the Russians on the north, of the Turks on the west, and the British in India on the south.

Arabistan, the country of the Arabs, is of very little weight in the political affairs of Asia, and has always been so since the destruction of the caliphate. Its inhabitants are for the most part divided into wandering tribes, who are mostly independent of one another, and therefore cannot act in union and with effect. Some of them are subject to the Turkish empire, but the Arabs and Turks consider one another as personal enemies, and have frequent feuds. Though this country is very thinly peopled, its inhabitants may be estimated at from ten to twelve millions, and it is divided into four considerable sovereignties and a great number of smaller political bodies, which however are often more or less dependent either on an Arabian prince or a foreigner. The four great sovereignties are formed by the religious political government of the Wahhabites, in the centre of the country, the Nejd, which indeed seemed entirely destroyed in 1815, but which again, as has already been the case more than once, raises its head, and begins to exist as a separate political body, though it is in some measure subject to the active pasha of Egypt. The most powerful monarchs, besides them, are the Imam of Yemen on the southern shores, and that of Muscat on the south-eastern corner, who, no less than the Sheriff of Mecca, and a great number of petty Beduin princes, are always engaged in secret or open war against the Turks, who claim them as their subjects. At the present moment it may be said that the power of the Turkish emperor over Arabia is only nominal.

The Turkish empire constitutes the last of the three great powers of western Asia; but its power in Europe having considerably declined, especially of late years, this has had a corresponding effect on its political relations in Asia; and it can no longer be said that this empire extends over countries lying in the three great divisions of the ancient world.

Not many years ago, the surface of the Turkish empire was estimated at 900,000 square miles; but since that time its possessions in Africa, which formed nearly a third of the whole, have been lost; Greece has been separated from its territory in Europe, and even of the countries belonging in Asia to the Turkish empire, which, on a surface of about 450,000 square miles, contain about twelve millions of inhabitants, a great province, Syria, has been yielded up to the pasha of Egypt. The other provinces, divided into pashalics, are not in any intimate connexion with one another, nor even with the centre of the empire, and a great number of the inhabitants of the pashalic of Erzerum, which protects the northern boundary of the empire against Russia, have been transplanted to other countries. Many of the nations which inhabit the provinces lying on the boundary, as the Turkmen, the Kurds, the Caucasians, are still more difficult to keep in subjection than the pashas themselves.

ASIA, BOTANY OF. With reference to the character of its vegetation, Asia may be conveniently divided into seven regions, namely, 1. the Siberian; 2. the Tartarian; 3. the Cashmerian; 4. the Syrian; 5. the Himalayan; 6. the Indian; and 7. the Malayan or Equinoctial. There are certainly no very precise limits between these, but nevertheless they may be taken as representing so many well-marked features of the Asiatic Flora, and as expressing the most important differences of climate which this division of the world exhibits.

I. The *Siberian* region comprehends all the northern parts of Asia lying between the Arctic Ocean and Tartary, including Kamtchatka on the east and the whole range of the Caucasian and Ural Mountains on the west, thus forming a broad belt passing over the whole continent, and limited on the south by the 50th parallel of latitude. In its general features this region is essentially European on the west, and similar to the west coast of America on the east. Its northern portion experiences in many places extremely rigorous winters and short summers, and the earth is perpetually frozen below the vegetable mould that overlies the surface. In the neighbourhood of Eneseisk or Yeneseisk this is particularly remarkable. In that part of Asia the cold is so incredibly intense, that, according to Gmelin, 72° below zero of Fahrenheit is not very unusual, and it has been known as low as 120° below zero; birds and animals, as well as man,

perish beneath this dreadful temperature, their very blood being frozen in their veins.

In a country where this degree of cold exists, vegetation must of necessity be of the most stunted description; accordingly we read of whole districts covered with nothing but morasses of coarse rushes mixed with diminutive birches and arbutus, small willows, and an arctic bramble or two; cabbages will not exist, and corn is almost unknown in a growing state. In somewhat milder districts, where perpetual sunlight begins to be exchanged for the alternation of day and night and longer summers, the country is clothed with immense forests of birches, larches, and pines, among which the Cembra pine is a noble object, frequently attaining the height of 120 feet; to these are added Tartarian maples, balsams, poplars, and wild cherries, along with many species of *Caragana*, which is a genus characteristic of Siberia. Great numbers of gentians, especially *G. algida*, with its blue and white blossoms, large patches of the yellow *Rhododendron chrysanthum*, and the rich purple *Rhododendron dauricum*, with quantities of dwarf almonds and a great variety of other pretty flowers, fill the meadows and open parts of the country. Lilies of different kinds are met with in abundance in the eastern parts of the Siberian region, and their bulbs are used in Kamtchatka for food: in many places are also found rhubarbs, especially that sort called *Rheum undulatum*, but not the officinal species, the station of which is probably in the Tartarian region. Among the strong points of resemblance between this portion of the Asiatic Flora and that of the opposite coast of America may be mentioned the abundance of cinquefoils (*Potentilla*) found in both, one of which, *Potentilla pectinata*, appears to be common to both countries; *Pedicularis resupinata*, a very remarkable species, is also met with in both. Corn is cultivated successfully only in the southern parts of the Siberian region. In the eastern part, according to Malte Brun, grain has not been found to ripen either at Oodskoi, which is under 55°, or in Kamtchatka at 57°, but the south-west parts possess remarkable fertility. On the north of Kolyban, barley gives a return of twelve and oats of twenty fold. Wheat is, however, raised with difficulty, and in its room the inhabitants sow different kinds of buck-wheat (*Polygonum*), from which a bad kind of bread is prepared, as in China and some parts of Lombardy.

II. The *Tartaric* region, as it is next the Siberian, so it resembles it in most respects; and it may even be doubted whether it ought to be botanically distinguished, especially as very little is known of the exact nature of any part of its Flora, except that of Kunawur. It may, however, be characterized as being essentially Siberian in its genera, but distinct in the majority of its species; and so modified by the extreme cold and dryness of the climate, in consequence of the great elevation of the country, that most of the Siberian species, which are formed to breathe a more humid air, can scarcely exist in it. Cut off from the plains of India by the lofty pinnacles of the Himalayan range, it has no gradual communication with a tropical Flora in any of its provinces, but retains to its most southern limits its own peculiar aspect. Of the few species which botanists have seen from the most southern part of this region, scarcely any are met with in Siberia. What is called by travellers Tartaric Furze, has been ascertained by Mr. Royle to consist of prickly species of *Genista*, *Astragalus*, and *Caragana*; and the gooseberries, and currants, and willows, and rhubarb, are all of kinds unknown to the north of Asia, starved and stunted by the miserable climate.

The passes to the northern face of the range of stupendous mountains which divide the *Himalayan* region from that on the west, are described by Burnes as almost destitute of vegetation; but the assafoetida plants grow there in great luxuriance, and form the principal pasture of the flocks which browse on them. An umbelliferous plant, called Prangos, is also found a valuable winter food for sheep.

In some places of this Trans-Himalayan region the aridity of the atmosphere is so great, that things neither rot nor decompose, but fall to dust in course of time: the surface of the soil is parched up and actually baked white by the scorching influence of the sun's rays, so that the face of the hills is actually dead. On the elevated table-land of Tartary the mountains are from 18,000 to 19,000 feet above the sea, and rise from the water's edge without forests or even a bush,

clothed with a withered and russet vegetation, and bare of snow. (Royle.) In other places, however, many trees are met with, among which are Tartaric species of ash, hazel, cypress, oaks, poplars, birches, paviars, &c. The *Neoz pine* (*Pinus Gerardiana*), the seeds of which are eatable, like those of the stone pine in Europe; the Indian cedar (*Abies Deodara*), *Abies Webbiana*, and a few other trees, with a northern aspect, straggle on the mountains from the Indian side, and give an air of grandeur to some parts of this otherwise desolate region. Some places in the lowlands, such as Balk, where the climate is less arid, produce fruit of great excellence, and resemble the Flora of the Cashmerian region. In Kunawur, barley, buckwheat, and turnips, were seen by the Messrs. Gerard at 13,600 feet; and a little lower the ground was covered with thyme, sage, and many other aromatic plants. At 17,000 feet Tartarian furze still grows.

III. In the northern districts of Persia, and in those provinces which stand between the Indian territory and that kingdom, nature still refuses to assume the tropical features which, as will presently be seen, characterize Asia south of the Himalaya and east of the Indus. In many respects the vegetation of this, which may be called the *Cashmerian* region, is so like that of Europe, that, according to a French traveller in Cashmere, one would fancy oneself on a mountain in Auvergne, rather than in an Asiatic province bordering upon India. This arises from the resemblance that exists between the climate of many parts of Persia and that of Europe, which is mainly due to the high level of Iran. Sharp winters and fine warm summers nourish races of trees and flowers far more luxuriant and delicate than can appear in the long-protracted cold, and short summers of Siberia, or the dry and inclement steppes of Tartary. It is here that plants which delight in bright light and high summer heat, with a moist atmosphere, in their growing season, but which require a long and steady rest in winter, are met with in perfection; in a word, it is a climate which would suit tropical plants if it were not for the periodical cold. Rice, oranges, and olives, pomegranates, almonds, and fig trees, remind the traveller of Italy, while grapes, mulberries, and the ordinary European fruit trees cast a northern aspect over the scenery. All things that require much heat and light to arrive at perfection, such as the fragrant principle of tobacco, the narcotic juice of the opium-poppy, and the tears of the manna-ash, are produced in the Cashmerian region in the greatest excellence. In some places the appearance of a few herbs of tropical forms indicates an approach to the vegetation of India; such as the saleg plant, which belongs to a genus otherwise confined to the tropical parts of Asia; cotton; and here and there the sugar-cane; but there is no trace of the great features of a more southern vegetation. In Cashmere the most interesting part of the flora is collected. In this province flourish many of the fruits now cultivated in Europe; apricots, peaches, plums, cherries, apples, pears, and grapes, all in the greatest profusion, supply the markets. The walnut, which here is wild, is cultivated extensively for the sake of the oil which is pressed from its seeds, and used both in cookery, for burning, and instead of linseed oil for painters' work. 'The vine scales the summit of the poplar, and is never restrained by pruning, though, compared with it, those of Europe, either on the trellis or the wall, sink into insignificance.' In the forests are found oriental planes and horse-chestnut trees (*Pavia*) truly wild; in the fields grow most of our European kinds of corn along with rice; and in the gardens the ordinary culinary vegetables of Europe. The Singhara nut (*trapa*) forms an object of general cultivation in the lakes which surround the city of Cashmere; one lake alone is stated by Moorcroft to produce from 96,000 to 128,000 ass-loads of this nut, and about 30,000 people are almost wholly supported by it for five months out of twelve. Nothing perhaps is more remarkable in Cashmere than its floating gardens, formed from the entangled stems of water-lilies covered with earth, and planted with melons and cucumbers, which, thus treated, arrive at the highest state of perfection, and are produced in great numbers.

The prangos, already mentioned, a kind of umbelliferous plant, is collected in some parts for the sake of the leaves, which, when dried, furnish a fodder much esteemed for sheep; and finally, the saffron crocus, which arrives at a great size, is extensively cultivated, and is a source of considerable revenue.

IV. Dovetailing, as it were, with what we have called the

Cashmerian region, passing even through southern Persia into northern India, and finding its eastern limits in the Great Indian Desert, of which Delhi may be considered as the extreme point, is a botanical region that requires to be distinguished, and to which the name of *Syrian* may be conveniently given, from its commencing with Syria on the west. It also comprehends the greater part of Turkey in Asia, and the north of Arabia. It might almost be called a *Southern Tartarian* region, for its peculiar appearance is caused by aridity and heat, as that of the real Tartarian region is caused by aridity and cold. At its western extremity the Syrian region resembles the north of Africa and the south of Europe in many of its plants; on the east it is occupied by species having a certain degree of relation to the others, but more Indian in their character; for instance, it appears from Mr. Royle's list, that near Delhi such plants as species of *flacourtia*, *elytraria*, *cocculus*, and *lepidagathis*, which consist principally of Indian species, are intermixed with *fagonias*, *grewias*, *capers*, camel's-thorn (*Alhagi*), *æruas* and scrubby *heliotropes*, which are truly Syrian. Desolation is the characteristic of a very large part of this region; destitute of water, and scorched by a fervid sun, it is physically impossible for the vegetation to consist of any but stunted shrubs or starved and withering herbs. The trees are few and thorny, and scantily clothed with foliage; the very herbs are spiny from want of power to develop the soft green parenchyma of the leaf between their rigid veins; and they are shaggy with long hairs, which nature gives them as a feeble means of sucking up the scanty moisture of the atmosphere. If among this barren region oases are found shaded with date trees and mountains rich with verdure, they only form a sad contrast with the dreariness of the scene beyond them, and by no means diminish the truth of the picture we have drawn. Sinde may be considered the most south-eastern point of the Syrian region; here the vegetation of uncultivated tracts is described as of a miserable description. Great quantities of a sort of tamarisk, intermixed with thorny acacias, a deformed euphorbia, the flowers of which are still more uninviting than its bloated leafless stems, neem trees (*melia*), and peepuls (*Ficus religiosa*), constitute the principal features of the scenery.

V. From countries like these we turn to the rich and varied sides of that stupendous mountain-ridge which, under the name of the Himalaya, forms an eternal barrier between Tartary and Hindustan. Of this fine region, which may hence be called the *Himalayan*, an invaluable account is given by Mr. Royle in his *Illustrations of the Botany of the Himalayan Mountains*, to which we are indebted for the principal part of our data regarding the vegetation of India. In consequence of the rich and humid plains that lie at its feet, and its great elevation, it is characterized by an intermixture of tropical and temperate plants, the former of which ascend the sides of the hills till they lose themselves among the latter, which in their turn give way, as the snow is approached, to truly Alpine vegetation. In the Himalayan region may also be comprehended the whole of the north of China and Japan and the higher ranges of the Neigherry, so strong is the resemblance between the plants of these countries and the north of India in their leading features. As the Himalayas are ascended from the plains, the pineapple is found no longer to flourish; mangoes and custard-apples suffer from cold; the plantain is only able to exist in consequence of the numerous coverings formed by the sheaths of its leaves. The trees are nearly the same as those of the plains of Upper India, 'consisting almost entirely of dicotyledonous species, which lose their leaves in the cold weather as completely as trees in more northern climates.' Two species of *phenix*, or date, form the only palms that are met with; and bamboos become few and weak. But within the Himalayas, at elevations of 2000 feet and more, are valleys which, 'being within the influence of the tropical rains, have a peculiarity of atmospherical phenomena which favours the existence of a series of forms not otherwise to be expected in a climate of which the mean temperature is so low.' Here accordingly are found oranges in a wild state, arborescent plants related to the cashew-nut, cassias, bauhinias, and gigantic cotton-trees, great forests of saul trees (*Shorea robusta*), and shrubby euphorbias; among which are found abundance of scitamineous plants and many epiphytal orchidæ. Cane-palms (*calamus*) reach these valleys, but ascend no higher; and are met by a pine (*Pinus longifolia*), which descends from the mountains till it loses

itself amidst tropical forms and a few straggling elms, willows, roses, violets, and other European-looking plants. Mr. Royle mentions 4000 or 5000 feet as the average height at which tropical trees entirely disappear.

It is in the mid-region of the Himalayas, 'between 5000 and 9000 feet of elevation,' that its most lovely features are to be seen. Here in many places occur in the rainy season a few lingering tropical herbs, which are protected from the cold in winter by the earth in which they grow; several scitamineæ, begonias, osbeckias, and justicias, are found among quantities of balsams; while the trees are oaks, sycamores, elms, hornbeam, and pine-trees, and the shrubs berries, roses, and honeysuckles, all of Indian species but European forms: in this favoured spot are also found numerous saxifrages, crowfoots, geraniums, and violets, with gentians, primroses, and labiate plants. It is this belt that is inhabited by the scarlet rhododendron, and on its lower edge by those wild camellias and tea-like plants which render it probable that the tea-plant itself with all its commercial wealth might be transferred from China to the British dominions in India. At 9000 feet elevation is found the curious *Roscoea alpina* of Mr. Royle, which is a most remarkable instance of an Alpine species of a tribe almost every other species of which is tropical.

The third and upper belt only ceases with vegetation, which on the Himalayas is protracted to an elevation unknown in any other part of the globe. As we ascend from the second belt, trees of rhododendron and *Quercus lanata* are first passed through. To them succeed pines and firs of various kinds; of which the most remarkable species are *Pinus excelsa*, and *Abies Webbiana*, *Deodara*, and *Morinda*, which exist in a splendid state at 11,000 and 11,500 feet of elevation; oaks in great variety, yews, birches, sycamores, and poplars, together with *Rhododendron campulatum*, roses, viburnums, and honeysuckles; after which follow patches of snow, with the Himalayan bamboo (a very curious circumstance), levelled with the ground. To these succeed forests of *Quercus semecarpifolia*; and finally the limits of vegetation are marked by a few starved yews and junipers, with primroses 'pressing up in the warmer situations, dwarf species of *Rhododendron*, *Andromeda fastigiata* (the heather of Mr. Frazer), and *Salix Lindleyana*.' It is curious to find on these mountains some plants, the general conformation of which is first Chinese and then American; instances of which occur in the genera *Tricyrtis*, *Abelia*, *Camellia*, and many others, which are Chinese, and in *Triosteum*, which is completely American.

The agriculture of this region is as singular as the other parts of the vegetation; wheat is sometimes cut at the top of a mountain, and rice at its foot. Maize, millet, and many small grains constitute 'the rain-crop'; capsciums, turmeric, and ginger, are grown as high as 4000 feet; cotton succeeds even in Kumaon; wheat is cultivated as high as 10,000 feet, and even 12,000 feet according to Captain Webb.

Notwithstanding the difference in the aspect of the countries and the want of the mountains that constitute the great features of the Himalayas, the plants of the north of China and Japan are undoubtedly of a nature sufficiently similar to be included in the Himalayan region; and if we were also to comprehend the mountain Floras of Java and other Malayan islands, we should probably be correct. At present, however, the data regarding these places are not sufficiently exact to enable us to separate them from the Malayan region in which they are found.

VI. In the *Indian* region should be comprehended all those countries which, like Hindustan, are capable of bearing coffee, indigo, sugar-canes, palms, and other ordinary products of a tropical district, without excessive humidity existing at all periods of the year. In this view it would include Arabia Felix, Burma, Siam, Cochin China, and the continental lands connected with these countries. What is called jungle is met with in most parts of this region. In the words of Mr. Royle, 'tracts of this kind are low, and being inundated during the rainy season, as well as by the hill-streams frequently overflowing their banks, are generally in a moist state, and have hence been called the Turrai or moist land. The powerful rays of a nearly vertical sun beating upon this, and a dense mass of vegetation where there is little circulation of air, produce a heated and moist atmosphere highly favourable to the production of tropical plants.' From the southern and eastern parts of this tract, or the confines of Silhet and Chittagong, Drs. Rox

burgh and Wallich obtained their splendid specimens of tree-ferns.

In these damp and swampy forests eternal pestilence reigns; so that the native wood-cutters are often unable to remain in them more than a few days at a time, fevers and bowel complaints universally attacking them after a short exposure to their baneful influence. It is here, however, that some of the most remarkable and valuable of the vegetable productions of continental India are to be met with: it is here that are found the sapan trees, so important for their extreme hardness, teak, and many of the finest of the Indian timber trees; and amidst the vapours arising from the beds of the mountain-torrents which often tear a way for themselves through the forests, abound numerous species of ferns, together with those singular plants called by botanists *Orchideous epiphytes*, which cling by their aerial roots to the branches of trees, and astonish the traveller by their brilliant colours and grotesque forms.

In the cleared ground, where the soil is exposed to the rays of the sun and the earth is dried by a free ventilation, palms and evergreen trees of remarkable kinds are met with. Mangoes are planted round the villages, Palmyra-trees (*Borassus flabelliformis*) are in many places extremely common; cocoa-nuts and Gomuto palms (*Arenga saccharifera*) are of frequent occurrence; a coarse grass overruns the plains, except in the cultivated spots, which are occupied by rice, sesamum, cotton, hemp, sugar-canes, yams, indigo, maize, the betel and other peppers. In place of *epiphytal orchideae* the branches of trees are occupied with parasitical *loranthi*, which, absorbing their food from the inside of the trees that bear them, are able to set at defiance the dry atmosphere with which at one season of the year they are surrounded. Tobacco arrives in some places, as on the coast of Martaban, at such excellence as to rival that of Shiraz, and to render it a subject of surprise that it should not have been an article of export. Add to these areca palms, plantains, and bananas, jacks (*Artocarpus integrifolia*), guavas, and jamrosade trees, and a tolerable notion will be had of the ordinary appearance of the true Indian region. The flora of this country is, however, so vast, that no general description can give an idea of its richness and variety.

Among the most remarkable features in the Flora of India is the Banyan tree (*Ficus Indica*), the branches of which emit roots which descend to the earth, where they fix themselves, and become in time large trunks. When a banyan tree becomes old, and acquires a great number of such trunks, one individual will have the appearance of a grove. Many cases are cited of trees of this sort arriving at a prodigious size; the following, mentioned in the Journal of the Asiatic Society as growing in the territory of Mysore, will give a good notion of the surprising magnitude they sometimes attain. 'The centre tree is about fifty or sixty feet in height, and its branches cover an area of seventy-six yards in one direction and eighty-eight in the other, while the drops now dependent from, or rather supporting, its gigantic branches, amount in number to one hundred and twenty-one, of which some are of enormous size. The place exhibits on all sides vast branches broken off, which have been evidently once connected with thirty trees, now disunited from the centre stock; but the original connexion can still be sufficiently traced to render unnecessary the testimony of the villagers, who state that they and their fathers have been in the habit of disuniting these trees by separating the intermediate parts for the construction of solid cart-wheels, for which, from their size, they are well suited. On measuring the transverse diameters of the whole area, they are found to contain more than 100 yards each way—this single tree thus affording a circle of foliage and shade exceeding 300 English yards in circumference.'

Ceylon may be referred to the Indian region, notwithstanding its insular position. It produces cinnamon forests, nutmegs, and coffee; satinwood and ebony trees are found in abundance in the jungle about Trincomalee; while the forests of the island abound generally in other kinds of timber valuable for naval and other purposes. A kind called Wallapote is spoken of by Mr. Brooke as girthing from twenty-eight to thirty-two feet.

VII. The seventh and last region of the Asiatic Flora is that which we would call the *Equinoctial or Malayan*. Spread over islands lying under the line—their centres usually occupied by mountains, and their coasts washed by the waters of a vast ocean—the features of this Flora are essentially different from those of the continent of India. The atmosphere

is in a state of perpetual humidity, acted upon by a vertical sun; the land is little cleared, and allows but slender opportunity for the sun and wind to dry it. Many of the islands are little better than a mass of jungle, or at all events these dense and pestilential woods occupy a considerable portion of the surface. Many of the islands are intrenched with rank after rank of the living palisades of the mangrove, rooting into the mud, and surrounding the taller stems of the Nipa palm, Barringtonias, and thickets of sword-leaved vaquios trees. These woods are so dense that the sun never penetrates them; so entangled with climbers, coarse grasses, bamboos, and cane-palms, that no human being can penetrate them without a company of pioneers; and so damp that the parasites actually struggle with the leaves of the trees on which they grow for mastery over the branches; spice-trees, nutmegs, and cinnamon, camphor-trees (*Dipterocarpus*), and tree-ferns, here find their home; and in the depths of their recesses are sometimes nourished the fungus-like form of the huge *Rafflesia* flower. On the mountains are many species of oak, dammar pines, rhododendrons, and magnolias; and at the summits are found crowsfoot, valerians, bilberries, berberries, brambles, honeysuckles, gentians, and other well-known European forms.

The cleared ground of these countries is occupied with a great variety of fruit trees common to the rest of India, along with the mangosteen, durian, and rambutan, many-headed pines, jacks, and shaddockes, which attain their highest perfection here only. Even in the smaller islands the vegetation is of a similar kind. All the Maldives to any extent are richly clothed with wood, chiefly palms: among which the cocoa-nut is of such importance, that it is doubtful whether some of the Malayan islands would be habitable without it, from their want of water; the inhabitants give its milk to their cattle, and never use any other beverage themselves.

(See *Journal of the Royal Geographical Society of London*; *Journal of the Asiatic Society of Bengal*; *Royle's Illustrations of the Botany of the Himalaya Mountains*; *Malte Brun's Geography*; *Gmelin's Flora Sibirica*; *Wallich's Plantæ Asiaticæ Rariores*; *Reinwardt über den Charakter der Vegetation auf den Inseln des Indischen Archipels*, &c.)

ASIA, ZOOLOGY OF. Considered in relation to its extent, the continent of Asia and its islands contain a greater number and variety of animals than any other quarter of the globe. This, indeed, might reasonably be expected, from the diversity of soil and climate, the alternations of heat and cold, of drought and moisture, of mountain and lowland, of luxuriant forest and bare plains. Nor is it only in the number and variety of its zoological productions that Asia claims our particular attention. Their intrinsic value in the economy of human society, the prominent part which they played in the early civilization of mankind, and the universal importance which still attaches to the cultivation of domestic animals among the most civilised and refined, as well as among purely pastoral nations, make the consideration of Asiatic zoology an object of interest not less to the historian, the antiquary, and the general inquirer, than to the zoologist. In fact, the great majority of the domestic animals which enabled man to till the earth, to extend his power, and to transport his commodities to distant regions, which first gave to civilized man that mastery over the productions of nature that perhaps more than all his other attributes, distinguishes him from the savage, and which still continue to furnish him with food and raiment, are of Asiatic origin: the camel, the horse, the ass, the ox, the dog, are all of eastern derivation; and it is there alone that we must look for the original types of these useful animals. Naturalists have wasted much time in endeavouring to discover the wild sources from which some of our most common and useful domestic animals were derived; had they looked for the origin of the dog, the cat, the sheep, and the goat in those regions which witnessed the first dawn of human civilization, and in which these valuable servants were first brought under the dominion of man, their researches would probably have been attended with greater success; for it is but natural to suppose that the wild species, if they still exist in a state of nature, are to be found in the districts where they were first reclaimed.

The numbers, and relative distribution of Asiatic mammals, are expressed in the following table.—

ORDERS.	Whole No. of known species.	Whole No. of Asiatic species.	No. of species peculiar to Asia.	No. of species common to Asia and other Continents.
I. Quadrumana	186	45	39	6
II. Cheiroptera	192	46	41	5
III. Carnivora	320	112	60	52
IV. Marsupialia	67	6	3	3
V. Rodentia	295	111	75	36
VI. Edentata	23	2	2	..
VII. Pachydermata	30	11	8	3
VIII. Ruminantia	157	64	46	18
IX. Cetacea	76	25	14	11
Total	1346	422	288	134

Thus it will be observed, that of 1346 known quadrupeds, 422, or very nearly one-third of the whole number, inhabit some part of Asia or its dependent islands; but of these it will be further remarked, that 288 only, or about two-thirds of the whole, are peculiar to that continent, the remaining 134 extending into the neighbouring continents of Europe and America. Indeed it may be generally observed, that the zoological productions of the northern parts of these three continents respectively, if not absolutely identical, are at least extremely similar, even in their most minute features; northern Asia, in particular, from its relative position, as situated between and connecting the other two, partakes equally of the productions of both; and it is probably to this circumstance, more than any other, that we ought to attribute the comparatively small number of its entire mammal inhabitants which are peculiar to this continent, when compared with those peculiar to Africa or America. Africa, for instance, contains 300 quadrupeds; yet out of these 50 only are found beyond the boundaries of that continent; America, again, out of no fewer than 537 species, has only 57 common to other regions, whilst, as already observed, Asia, out of 422 species, has no fewer than 134 equally common to Europe, Africa, and America. It will be likewise observed, from the foregoing table, that the Edentata and Marsupialia are the two orders of mammals in which Asia is most deficient, and that it is most rich in the number of its Ruminantia, compared with the whole number of known species. This is precisely the reverse of what we have already observed regarding the zoological productions of America, nor is the circumstance without importance to those who study the progress of society and the development of civilization in these two continents.

The elephant, though never bred in a tame state, ought to be considered at the head of the domestic animals of Asia. The inhabitants of India appear to have known and practised, when Alexander's army entered the country, the very same modes of capturing and training the elephant which are employed at the present day. Their antient writings mention this animal as a domestic servant, and he is constantly represented in the same character upon their public monuments. Alexander the Great, during his expedition into the north-west parts of India, found the armies of the native princes attended by their war elephants, just as the European invaders of the same country have done in later times; and from that period the elephant appears to have been constantly employed by the successors of Alexander in western Asia, and also by the Carthaginians, and Pyrrhus, the king of Epirus, who fought against the Romans in Italy. Immense troops of wild elephants are still found in the northern parts of India, in the Malayan peninsula, in Ceylon, and probably in all the large islands of the Indian Archipelago. Those which are employed in the East India Company's service, and which rarely exceed seven feet and a half average height, are obtained in the upper provinces, principally from the vicinity of the great saul forest, which skirts the lower ridges of the Himalayan chain for some hundred miles, and in which these animals are particularly abundant.

The common domestic animals of Asia present more varieties of species, and attain to greater individual perfection of form, than those of any other quarter of the globe. The horse, the ass, the camel, and probably most other species, are originally natives of the central plains of this extensive continent, and, though no longer found in a state of nature, are still proverbial for their symmetry and spirit. In Arabia, particularly, the horse is, of all other animals, the object of

most especial care and value. No Arab, however poor in other respects, is without this noble animal, which is at once his friend and companion, the sharer of his riches or poverty, and the partner of all his toils. Subsisting on the same food as his master, which, during their long expeditions in the deserts, is often limited to a scanty supply of dried dates, temperate and enduring to a degree scarcely exceeded even by the camel or dromedary, lodged in the same hut, and caressed with the fondness of a child, the Arabian horse is never subjected to the performance of any mean drudgery or servile labour, and the record of his pedigree and kindred is preserved with the greatest care. This mode of treatment has a corresponding effect on the habits and character of the animal. In no other part of the world does the horse display so much gentleness, intelligence, and spirit as in Arabia; the pupil and constant associate of man, he almost seems to have caught a spark of human reason, readily comprehends and executes the orders of his master, and returns with delight and evident gratitude the attentions bestowed upon him. The nomadic and pastoral nations, which have from time immemorial occupied the central plains of Asia, are universally an equestrian people, they may be almost said to live on horseback, and indeed it would be impossible for them to carry on the predatory expeditions for which they have been in all ages remarkable, or to traverse the steppes of Asia, without the aid of this noble animal. Nor do these people employ the horse as a beast of burthen alone; his flesh supplies them with their favourite food, and the milk of the mare is the greatest dainty of a Tartar feast. Wild horses are said to exist in the interior of Tartary, where the inhabitants hunt them for the sake of their flesh; but the account in this instance, as in the similar report of the existence of wild asses in the same localities, cannot be implicitly relied upon, as travellers imperfectly acquainted with zoological distinctions frequently give the names of familiar animals to others which resemble them in form and appearance, without attending very closely to their specific difference. In the present instance, it is more than probable that both the wild horse and wild ass of eastern travellers are to be referred to the *Dziggetai*, a species of intermediate size and form, which inhabits the same regions, and has always retained its original freedom.

The asses, like the horses, of Asia are of larger proportions and more generous spirit than those which have been transported to other countries. That central Asia was originally the habitat of both these animals there can be no doubt, not only because we find them there domesticated at the earliest periods of which we have any record, but likewise because the Asiatics are, and, as far as we know, always have been, equestrian nations, whilst, in the neighbouring continent of Africa, the species was probably introduced from Asia, though at what period is uncertain. The horse, indeed, was early known and used in Egypt, as we know from the monuments and from written history. But the negroes of interior Africa, and, generally speaking, the whole southern part of the continent, are to this day destitute of either the horse or the ass. Nothing can present a greater contrast than the comparison of the degraded and degenerate ass of Europe with the same animal bred in his native country. Instead of the dejected air, shaggy coat, pinched dimensions, and miserable half-starved appearance which he presents in these countries, the ass of Persia, Syria, and the Levant approaches nearer to the larger size of the horse, and partakes much of his beautiful symmetry of form, noble carriage, and unrivalled speed.

It appears extremely probable that the camel and dromedary are likewise of Asiatic origin. The wide extent of the Arabian conquests during the middle ages introduced the latter species into most parts of northern and central Africa, where it has been ever since established, and is of the greatest use in crossing the sandy deserts which separate the inhabited regions of the north from the interior of the continent. The camel, which is distinguished from the dromedary by having two humps on the back instead of one appears to have been in all ages more limited and confined in its geographical distribution than the latter species. The camel is found chiefly, if not solely, among the wandering Tartars, from the confines of Siberia to the northern ridges of the great Himalayan chain; whilst the dromedary spreads not only over Arabia, Syria, Mesopotamia, and Persia, but extended into India, and probably even into

China. These animals are mentioned among the earliest lists of the flocks and herds of the patriarchs. and it is not a little singular that here, as in the case of most other domestic animals, not the slightest trace seems to remain of the original wild stock from which the species was first reclaimed. Professor Pallas, it is true, reports the existence of wild camels in the neighbourhood of lake Aral, but he never met with them in his travels, though he frequently heard of them; and Baron Cuvier conjectures, with much seeming probability, that the reports refer to some of the wild animals to which the inhabitants of these regions, from religious motives, restore their liberty at the celebration of particular festivals.

Of the ox kind, no fewer than four distinct species have been, from time immemorial, domesticated in different parts of Asia. The common Indian ox (*Bos Indicus*), though usually confounded with the common ox of western Europe, is in reality a very distinct species; differing not only by his longer legs, and the large hump which marks his shoulders, like that of a dromedary, but likewise by his voice, and even by some details of internal conformation. This animal, from his superior height and more slender proportions, perhaps the most symmetrical and graceful of all the different species of the ox genus, has been from the earliest ages held in the greatest veneration by the natives of India; and there is a strong resemblance between the worship of Apis among the antient Egyptians, and that which the followers of Brahma paid to the Indian ox, as an incarnation of their favourite deity Vishnu. But the whole race of Indian cattle are not equally regarded as objects of religious veneration: these attentions seem to be exclusively bestowed upon a particular breed; and the greatest care is taken to maintain the purity of this sacred race, and to preserve the pedigrees of its individual members. The common Indian cattle, however, are not regarded with the same religious sentiments. They are the usual beasts of draught and burthen in the country; and, from their great speed, are frequently used for the saddle, even by the Europeans settled in the upper provinces. The intercourse which India always seems to have maintained with other commercial nations of antiquity was the means of introducing this beautiful and useful animal into more distant regions; and we now find the Brahmin bull extending over a great part of Persia and Syria, and mixed with the common flat-backed species of the west, in Madagascar, Abyssinia, and generally along the whole eastern coast of Africa.

The Yak (*Bos grunniens*) is another species of ox which has been long domesticated in central Asia. It has always formed the common cattle of the Tartars, and is well described by Ælian under the name of Poephagus. It is this animal which furnishes the tails of long silky white hair, of which the Turks make their military standards, and which are employed all over the East, under the name of chowries, for the purpose of driving away the flies and creating a refreshing current of air about the luxurious inhabitants of India and China. These favourite instruments of luxury are frequently set in silver or gold handles; and as they are an indispensable appendage to the state of a great man, they form one of the regular articles of import between Tibet and India, and are frequently sold for enormous prices. The use of these chowries is of very great antiquity throughout all eastern countries.

The Buffalo (*Bos bubalus*) is a third species of ox, long domesticated in the southern and eastern parts of Asia. India and China appear to be the original climate of this powerful animal: it is still found wild in all the great forests of both these countries, and is probably the only domestic quadruped of which zoologists have clearly ascertained the original source. The wild buffalo, called *arni* by the Indians, is said to be only inferior to the elephant in size; and from his ferocity and malignant disposition is much dreaded by those who reside in the vicinity of his haunts. Combats between the *arni* and the tiger were formerly a favourite sport of the native princes of India; but it is said by eye-witnesses that the tiger was in no instance a match for his powerful antagonist. Large herds of the domestic buffalo are kept throughout every part of the peninsula of India; and many anecdotes are related of their docility and attachment to the gullahs or herdsmen who attend them, and of the courage with which they defend their keepers from the formidable attacks of the tigers and panthers which inhabit the forests where they are usually pastured. The buffalo in India is not habitually used as

a beast of draught or burthen, but supplies the place of the common ox, in furnishing the inhabitants with milk and butter; whilst the ox of the country, which is seldom applied to these latter purposes, assumes the place of the horse, and is used for the saddle, the plough and the hackery, or carriage. Though long domesticated in India and China, the introduction of the buffalo into the west, or even into Persia, is comparatively a recent occurrence, and dates only from the conquests of the Mohammedans. Aristotle, indeed, seems to allude to the buffalo under the name of the Wild Ox of Arachosia (*Hist. of Animals*, book ii. 1); and the followers of Alexander must have become acquainted with the animal during that conqueror's expedition in the Penj-ab. But it was only towards the latter end of the sixth century that it was first seen in western Europe, having been introduced into Italy about the year 596; nor has the species ever extended either in this continent or in Africa, in which it is almost exclusively confined to Egypt.

The fourth and last known species of domestic ox which the Asiatic nations possess, is the Gayal (*Bos Gavæus*). This animal is common among the Burmese, and in all the mountainous districts on the north-east boundaries of British India: it is also found wild, under the name of Gaur, in many parts of India, principally among the hills, and is as much dreaded by the Sheecarries, or native hunters, as the *arni* or tiger. The gayal is a very large animal, with a heavy carcass and short legs, which are commonly white from the knee downwards, whilst the body is of a uniform dark brown colour: the os frontis forms a singular excrescence or ridge which easily distinguishes the gayal from all other species of the ox kind; and the horns are round, and twisted into a kind of irregular spiral, with the points turned inwards and backwards.

Of sheep and goats, many different varieties are found in Asia. The broad-tailed sheep of Arabia was known to the antients, and is mentioned by Herodotus (iii. 113) and Aristotle: this variety has now spread throughout all the steppes of the continent, as well as through Egypt and northern Africa, where the fat of the tail frequently amounts to ten pounds' weight. The tail is the best part of the animal, for the flesh is dry and insipid; and instead of wool, the body is covered with a short coarse hair, unfit for manufacturing purposes. On the higher table-lands of the continent, however, other species of sheep are found with a longer and finer fleece; but in no instance does the wool of the Asiatic sheep approach in softness and beauty of texture to that of the shawl-goat of Cashmere. from the fleece of which the Indians manufacture those rich and valuable shawls, which are so highly esteemed in Europe as well as throughout the East. The shawl-goat is a small variety of very ordinary form and appearance; it is found principally in Bhotan, Tibet, and generally along the northern face of the Himalaya, but does not thrive when brought across the mountains, not even in the upper regions of Nepal, where it might have been expected that it would find a congenial climate: its wool forms a valuable article of commerce between Tibet and the lower plains of India. The Angora goat is an inferior variety of the shawl-goat, with drooping ears and long wool of tolerably fine texture, but not adapted to the same purposes as the richer wool of the Tibet animal. The common variety of goat in Asia, which appears to extend over every part of the continent, is a tall long-legged animal, with very short hair, large drooping ears, and small spiral horns. Its flesh is in many parts preferred to mutton; and the animal is valued in all places for the richness and abundance of its milk.

The Hog, though found wild in most parts of Asia, is a domestic only among the Chinese, who appear to esteem its flesh in proportion to the detestation with which it is regarded by the followers of Mohammed and Buddha. In India, herds of semi-domestic hogs are frequently found about the native villages; but as the religion of Brahma prohibits the destruction of animal life, and consequently the use of flesh as an article of food, they are turned to no account by the inhabitants; by whom, however, they are not regarded with the horror and detestation which attaches to them among the followers of the Arabian prophet. The Indians abstain from the use of pork for the same reason that they abstain from eating any other kind of flesh; not from any peculiar antipathy which they bear to the animal itself. The hog is regarded by the Chinese as the greatest luxury; and it is well known that the dog and the hog

were the only domestic animals which their first discoverers found among the Polynesian islanders. It appears probable, however, that the animal called a hog in the voyages of early navigators, and which was found spread over all the various archipelagos of the Indian Ocean, is in reality a different species from our common European hog, though closely allied to it in form and appearance.

The Dog of Asia, as in every other great division of the world, is subject to an almost infinite number of varieties. Troops of this animal, called in India pabria dogs, inhabit every village, and without acknowledging any particular master, know and obey the inhabitants, warn them of the approach of wild beasts and robbers, and perform the common offices of public scavengers. Legacies are frequently left for their support by the pious Hindoos; and hospitals are built for the reception and care of the aged and wounded. But besides these public troops, which may be considered as the property of the state, there are various varieties of sporting and other dogs kept by private individuals in different parts of Asia; of which the principal are the large mastiff of Tibet, and the greyhound of Persia. The flesh of the dog is a common article of food in China, as it formerly was in the islands of the Indian Ocean; and it is said to be a most amusing sight to the few Europeans who have obtained access to the large cities in the interior of the empire, to witness the antipathy with which these sagacious animals pursue their enemies the butchers, when they appear in the public streets.

The Cat has always been a favourite domestic among the Asiatics; and the Mohammedans, in particular, who consider the dog as unclean, lavish all their attention and caresses upon this far less gentle and sagacious animal. In the central plains and table-lands of Asia, in Khorasan, Cashmere and Bhotan, as well as in Angora and other districts of Asia Minor, the fur of the cat assumes a long silky texture, of great beauty and fineness; and individuals of the esteemed colours are frequently sold for extravagant prices. This is the breed which is often brought to Europe under the name of Persian cats; they are much more gentle in disposition than our common domestic cat, but are less useful, and decidedly inferior to the dog as a pet or companion.

Of the wild Mammals peculiar to Asia, we have already observed that there are, comparatively speaking, a greater variety than in any other portion of the globe. The true apes (*pithecus*) are, with a single exception, that of the Chimpanzee (*P. troglodytes*) of Africa, peculiar to this continent; as are likewise the *Semnopithecus*, an extensive tribe which differs from them only by the possession of a very long slender tail. Among these latter, the Kahau, (*S. nasutus*), a large species inhabiting China and the Malayan peninsula, nearly attains to the dimensions of man, and is remarkable for a large prominent nose, which assimilates it in general appearance more nearly to the human species than any other of the monkey tribe. The Macaques (*macacus*) are likewise a purely Asiatic genus of quadrumana, and appear to supply on this continent the situation which the baboons fill in Africa. They swarm in all the woods of India and China, and are remarkable only for their malevolent dispositions and their disgusting manners. Of the Lemur tribe, two genera, *nycticebus* and *tarsius*, inhabit Asia: all the rest of this numerous family, as we have observed in the article on the zoology of Africa, are found in the island of Madagascar, and along the eastern coast of the neighbouring continent.

Among the Cheiroptera, or Bat kind, the *pteropus*, or large frugivorous species, are almost exclusively Asiatic; as are likewise the *galeopithecus*, or, as they are commonly called by travellers, flying foxes. Both these genera inhabit the woods and forests of the intertropical parts of Asia, principally those of the great Indian Isles; unlike the generality of winged quadrupeds, they are of diurnal habits, live entirely upon leaves and fruits, and are eaten by the natives. The more common species of nocturnal and insectivorous cheiroptera swarm in every part of Asia; the most remarkable among them is a species (*cheiro-meles*) with an opposable thumb on the hind feet, which inhabits the Malayan peninsula.

Among the Carnivorous animals of Asia are three or four different species of Bears; one of these (*Ursus Syriacus*), lately discovered on Mount Lebanon, is frequently mentioned by the sacred writers; the others inhabit the Himalaya and other more eastern mountains, except one

species (*U. labiatus*), which is found in the jungles on the plains of India. Besides these, the common brown bear of Europe, and the white, or Polar bear, abound in Siberia, Kamtschatka, and along the shores of the Frozen Ocean. The Bali-Saur (*arctonyx*) is the badger of India; and among the smaller Carnivora, the *Gymnura*, *Mydai*, *Ailuri*, *Arctites*, and *Paradoxuri*, are peculiar to the continent of Asia and the large islands of Borneo, Sumatra, and Java. Among the fur animals, northern Asia produces the sable, the ermine, and various other species of *mustela*; the sea-otter, the most valuable of all, has been hitherto found only in the northern Pacific, along the coasts of Asia and America, from the parallel of Japan northward, as far as navigators have yet been able to penetrate. The tiger, the most savage and formidable of all the carnivorous animals, exists only in Asia and the neighbouring isles; the Rimau-dahan (*Felis macrocelis*), a large species but lately described, inhabits Siam and Sumatra; and the leopard and panther are common among the forests of India. The lion also has lately been found in the province of Guzerat; but, unlike the African variety, he is without a mane, and appears to be altogether a much less formidable animal. The striped hyæna is common in all the warmer parts of the continent; and various species of wild dogs and foxes are every where abundant.

The Marsupial animals are for the most part confined to Australia; a few species, nevertheless, extend throughout the long chain of islands which nearly unite this continent with Asia. Of these, one is a kangaroo (*Macropus Bruynii*), the first of the genus ever discovered, having been described and figured one hundred and fifty years ago by Le Bruyn; the other five marsupials enumerated in the table belong to the genus *Phalangista*, and are distinguished from the Australian phalangiers, by having the tail partially or entirely naked and scaly.

Of the numerous Rodentia which inhabit every part of Asia, very few indeed are deserving of attention, either in a commercial or economical point of view. Three or four species of hares (*lepus*), and an equal number of lagomice, or hare-rats, are the only Asiatic animals of this tribe which Europeans are accustomed to consider as fit for human food; the rest consist principally of squirrels (many of which are of large size and prettily variegated with stripes and shades of different colours), rats, gerboas, hamsters, marmots, flying-squirrels, and two or three different species of porcupines. The gerboas (*dipus*), of which ten or twelve species are found in the deserts of the interior, burrow in the sand, at the root of some plant or shrub, and are almost the only animals which enliven the long and dreary wastes which the traveller frequently encounters in Asia, hopping along on the hind legs like a bird, and crossing his path with the rapidity of an arrow. The flying-squirrels (*pteromys*) inhabit the forests of the whole continent, from Siberia to Java, and are remarkable for an expansion of the skin along the sides, which enables them to leap to the distance of forty or fifty yards, in passing from tree to tree: it acts like a parachute to prevent too rapid a descent, though it is incapable of being moved like the wings of birds, and consequently of exercising the proper function of flying.

The Edentata of Asia are confined to two species, both belonging to the genus *Manis* or Pangolins, frequently called scaly ant-eaters by travellers. These singular animals in fact resemble the real ant-eaters of the American continent in every thing but their external covering, which, instead of the ordinary hair of quadrupeds, consists of a succession of parallel rows of large imbricated scales, that lap over one another like the tiles of a house, and are capable of being elevated or depressed at the will of the animal. One of the Asiatic species is clearly indicated by Ælian (lib. xvi. cap. 6) under the name of *Plattage*.

Among the Pachydermata of Asia, the elephant has been already noticed. Three different species of rhinoceros are known to inhabit the continent of India and the great islands contiguous to the Malayan peninsula. The continental species (*R. Indicus*), and that which inhabits the island of Java (*R. Javanicus*), have but one horn; the Sumatran rhinoceros (*R. Sumatrensis*) resembles the African species by having two of these excrescences, for they cannot be properly called horns. Of the genus *Equus* the common horse and ass have been already mentioned as in all probability originally indigenous to the central plains of Asia. One other species, the Driggetai (*E. he-*

monus), still retains its native freedom in the same localities. It is a beautiful animal, in point of size intermediate between the other two, with much of the symmetrical figure and graceful carriage of the horse, and of the same dun colour as the ass, marked along the back with a broad coffee-coloured stripe, but without the cross on the shoulder which distinguishes that animal. The Dziggetai, probably also the Koulan of the modern Persians, was well known to the ancients, and is mentioned by Aristotle and Xenophon by the name of the wild ass. Aristotle (*vi.* 36), in addition to the wild ass, mentions an animal called the Syrian mule, from its resemblance to a mule. The latter author mentions that, during the expedition of the Ten Thousand under the younger Cyrus, these animals were observed on the open plains of Mesopotamia, where the ostrich also lived; and though these gigantic birds no longer inhabit the Asiatic deserts, the same phenomenon is daily observed in South Africa, where the ostrich and the quagga are invariably found to associate together. Of the hog genus (*Sus*), two species at least are found in Asia: one of them, the common wild boar of Europe (*S. scrofa*), appears to extend over every part of the Old World; the other, the *Sus babyrussa* of naturalists, is peculiar to the great Indian Isles, and is remarkable for the singular manner in which the tusks of the upper jaw pierce through the lip on each side, and curl round and over the eyes like a pair of circular horns. The only other pachydermatous animal of Asia which deserves particular notice is the Malayan tapir (*T. Indicus*), a species the existence of which in this part of the world is the more remarkable, since its congeners are confined to the forests of South America.

Of the ruminating animals of Asia, the camel, the dromedary, and the four species of the ox kind which have been domesticated by the natives, have been already mentioned. In other respects, the principal feature in this department of Asiatic zoology is the great abundance of the deer tribe, and the comparative scarcity of antelopes. Out of thirty-seven known species of deer (*Cervus*), twenty-five are found in Asia, and of these twenty are peculiar to it; whilst not more than a dozen, out of nearly sixty antelopes, are found upon the same continent. These different species will be found described under the articles ANTELOPE and DEER respectively. But there is one small genus of Asiatic ruminants too remarkable to be passed over unnoticed,—the musks, so called from the Tibet species, which produces the perfume so well known by this name. The Tibet musk (*Moschus mosciferus*) is about the size of a small goat; both sexes are without horns, but the musk is produced by the male only, and is contained in a bag which grows upon the prepuce. This perfume has always been held in high esteem throughout the East, and when genuine and pure, is said to be sometimes sold for its weight in gold; but its great value holds out strong temptations to adulterate it with foreign substances, and the hunters are accustomed to mix the blood of the animal with it in order to increase the quantity, so that it can seldom be procured without adulteration. The Tibet musk inhabits the highest parts of the Himalayan and Tibetan mountains, seldom descending below the snow line, and leaping among the rocks and precipices with the security of the chamois or the ibex. Four or five smaller species of the genus *Moschus*, probably the smallest of all hoofed animals, being seldom larger than a good-sized hare, inhabit the forests of lower India and the islands.

The Cetacea of Asia are principally found along the northern coasts, and are the same species which frequent the Frozen Ocean generally. Various species of dolphins (*Delphinus*) inhabit the tropical seas, and the dugong (*Halicore*) is found among the great Indian islands; but in no other respects does this part of Asiatic zoology demand particular notice.

The principal circumstance worthy of notice in the birds of India, is the great abundance and varied and brilliant colours of the Gallinaceous tribes which inhabit this part of the world. Indeed the most valuable of our domestic fowls, the common cock and hen, as well as our domestic quadrupeds, originally came from this continent, and are still found wild in the woods of India; as are likewise the peacock, the pheasant, and many kindred species. The Himalayan mountains, in particular, produce three or four different species of the Tragophans, or horned pheasants, and the Impayan pheasant, remarkable for the brilliant me-

tallic lustre of its plumage. The gold and silver pheasants (*Phasianus pictus* et *mythemerus*), so common in the aviaries of Europe, are indigenous in China, as are likewise the collared pheasant (*Ph. torquatus*), and a new species (*Ph. Reevesii*) lately discovered, remarkable for the great length of the tail feathers, which sometimes exceed four feet; the fire-pheasant (*Ph. ignitus*) and argus-pheasant (*Ph. argus*) inhabit the mountains of Sumatra and Borneo.

It has already been observed that the ostrich, though formerly abundant in the deserts of Mesopotamia, is no longer found on the continent of Asia, unless we take the testimony of Herbert (*p.* 132), who says that he saw ostriches in the plains between Lar and Shiraz (A.D. 1627). The cassowary (*Casuarus*), a bird which nearly approaches the ostrich both in size and internal structure, inhabits the islands of the Indian Archipelago. In other respects the ornithology of Asia is by no means peculiar; at least the generic forms are not so remarkable as those of either Africa or America. All the common European species are found even in the most distant parts of the continent, apparently so identical, that specimens from the two localities cannot be distinguished even by the difference of a feather. The common house-sparrow, for instance, is found in the Himalayan mountains, and is as abundant about the villages of Upper Nepal as in any part of England.

The reptiles, fishes, and insects of Asia are likewise too nearly assimilated to those of other continents to require a detailed enumeration of their different forms and genera. Like birds, these different classes of animals possess powers of locomotion which are denied to mammals; and it is consequently to the latter class alone that we can look for anything very peculiar in the zoology of a continent like Asia or America. It is on this account that we have been more particular in the enumeration of the quadrupeds than of any other class.

ASIA MINOR. [See ANATOLIA.]

ASIATIC SOCIETIES are learned bodies formed for the especial purpose of instituting and encouraging inquiries into the geography, history, religions, languages, literature, &c., of the East. The earliest institution of this kind was the Asiatic Society of Bengal, founded at Calcutta by Sir William Jones, in January, 1784. Its transactions and the dissertations or essays read at its meetings, are embodied in the *Asiatic Researches*, the first volume of which was published at Calcutta, 1786, 4to.: the latest that has been received in Europe is the seventeenth volume, printed in 1832. Lately a separate physical class has been formed in the society, the attention of which is principally directed towards the zoology, meteorology, mineralogy, and geology of India: its transactions are published apart, under the title *Asiatic Researches: Transactions of the Physical Class of the Asiatic Society of Bengal* (part i., Calcutta, 1829; part ii., 1833, 4to.) Since the year 1832 the proceedings of the society have been published in a monthly periodical, *The Journal of the Asiatic Society of Bengal*, edited by James Prinsep, a publication which, from its cheapness and from the well-chosen variety of its contents, seems particularly calculated to awaken a general interest for the objects of the society.

At Paris an Asiatic Society was formed in the earlier part of the year 1822, by the well-known French orientlists, Silvestre de Sacy, Abel Rémusat, Saint-Martin, Chézy, &c., under the patronage of the Duke of Orleans (now King of the French). The transactions of this society were, from July, 1822, published in a monthly periodical, the *Journal Asiatique*, which, up to December 1827, formed eleven volumes, besides a separate volume containing an alphabetic index, &c. Since January 1828 the publication has appeared under the title of *Nouveau Journal Asiatique*. This journal is sent to all the members of the society, who pay an annual subscription of thirty francs (about 24s.). Through the careful management of its limited funds, the Asiatic Society of Paris has been enabled to encourage, by liberal subscriptions, the publication of several important works connected with oriental literature, and has besides printed some most valuable books at its own exclusive expense. Among the latter we shall here only mention the elegant edition and French translation of the Sanscrit play *Sacuntala* by the late M. Chézy.

A similar institution was formed at London in March 1823, and was incorporated under the denomination of the Royal Asiatic Society of Great Britain and Ireland, by a

charter which is dated August 11th, 1824. Its labours are published under the title *Transactions of the Royal Asiatic Society of Great Britain and Ireland*, of which, up to the present moment, two volumes, and two parts of vol. iii. have appeared. With a view to give a wider circulation to its proceedings, the society has determined in future to publish a *Quarterly Journal*, besides the *Transactions*, the first number of which is now in the press. The society possesses a library and museum, to which additions are constantly made by the liberality of its members and friends. The library contains some most valuable and scarce books and MSS. Among the latter, a collection of Sanscrit MSS., formed by Colonel Tod in Rajasthan, and presented by him to the society, deserves to be particularly noticed. Intimately connected with the Royal Asiatic Society is the Oriental Translation Committee, instituted in 1828, which has for its object 'to superintend the publication of translations of works in the oriental languages, and also occasionally of original texts, free of expense to the authors.' (*Regulations*, &c., 1832.)

The literary societies of Madras and of Bombay, though originally instituted for more general purposes, deserve to be noticed here, as their labours have in a great degree been directed towards the same objects as the Asiatic Societies of Calcutta, Paris, and London. The Madras Literary Society owed its origin to the late Sir John Newbolt, aided by Dr. B. G. Babington; but shortly after its foundation the society was deprived, by death or by removal from India, of several of its most able contributors. A volume of *Transactions of the Literary Society of Madras* was published at London, 1827, 4to. The society has since been combined with that of London, under the denomination of the Madras branch of the Royal Asiatic Society. Of the *Transactions of the Literary Society of Bombay* three volumes have appeared at London, 1819-1823, 4to. In 1829 this society joined the Royal Asiatic Society, and is now designated as the Bombay branch of that institution. At Batavia a society of arts and sciences was formed by the Dutch, which in point of time even precedes the Asiatic Society of Bengal. Its *Transactions* have been published in Dutch under the title *Verhandeligen van het Bataviaasch Genootschap van Kunsten en Wetenschappen*: the first volume appeared at Batavia in 1780, 8vo.; the latest that we have seen is the fourteenth, published in 1833.

ASKEW, ANNE, a lady of an honourable family in Lincolnshire, whose name is otherwise spelt Ascough or Ascue, has obtained mention in most histories of England, as one of those sufferers, who, before the final completion of the Reformation, abjured in part the doctrines of the Romish church. She was more highly educated than was ordinary in that day, and by study of the scriptures became a convert to the opinions of the reformers, at which her husband, one Kyme, a violent papist, was so much displeased that he turned her out of doors. She came up to London to sue for a separation, and appears to have attracted the favourable notice of the queen, or at least of some ladies high at court. She was soon accused of holding heretical doctrines concerning the sacrament, and denying the corporal presence of Christ's body in the elements after consecration; and on this charge she was committed to prison. Being examined before the chancellor, the bishop of London, and others, she is said to have replied boldly to the lord mayor's question, 'Whether the priests cannot make the body of Christ?' 'I have read that God made man; but that man can make God, I never yet read.' (Styrie. *Memorials*, i. p. 387.) Yet it is said by Burnet, that 'after much pains, she set her hand to a recantation, by which she acknowledged that the natural body of Christ was present in the sacrament after the consecration, whether the priest were a good or an ill man: and that, whether it was presently consumed or reserved in the pix, it was the true body of Christ.' (*Hist. of Reformation*, B. iii.) Her recantation, however, was not satisfactory, or at least not effectual, for she was soon apprehended again, examined closely as to her belief and doctrines, and committed to Newgate, where she was again strictly questioned as to what ladies at court had shown her favour and encouragement. Not being able to extract any information on this point, she was placed on the rack and cruelly tortured in the sight, and as Fox says, by the hand, of the Lord Chancellor Wriothesley, whose eagerness in this matter is ascribed to his desire to gain some ground of offence against the Duchess of Suffolk, the Coun-

teess of Hertford, or some other ladies. But her patience and fortitude could not be shaken, nor does it appear that she had any disclosures to make. She was burnt with four others at the stake in Smithfield, July 16, 1546. (Fox's *Martyrs*; Burnet's *History of the Reformation*.)

ASKEYTON or ASKEATON, a small town in Ireland, in the Conello lower barony, in the county of Limerick, about twenty miles S.W. by W. of the city of that name. It was once a walled town of some importance; and till the Union, it sent two members to the Irish parliament. It lies at the conflux of the river Deel with the Shannon. The population in 1821 was 1239, and that of the whole parish 3425. The chief claim of Askeyton to notice is founded on the remains of an ancient castle of the Earls of Desmond; and the fine ruins of an abbey adjacent to the castle, first occupied by the conventual Franciscans, and then by the Observantines. There are two fairs in the year. Askeyton is a vicarage in the diocese of Limerick. (Archdale's *Monasticum Hibernicum*; Seward's *Topographia Hibernica*.)

ASKRIGG, a small market-town in the county of York. [See YORKSHIRE.]

ASKOE, one of the numberless isles in the Bucker-fjord, or bight of Bucker, which lies within the north-western limits of the bailiwick of Stavanger and province of Christiansand in Norway. It is celebrated for the spring, called the Spring of St. Agatha, which is very cold in summer, and has never been known to freeze in winter: 60° 27' N. lat.

There is a Danish island likewise of this name, which lies south of Fæmø, near the coast of Zealand, and is inhabited by only 130 individuals. 54° 54' N. lat., 11° 46' E. long.

ASMONÆANS (Gens Asamonæa, בני השמונים or בית השמונאים or בני השמונאי הכהנים domus Hasamonæorum). The Asmonæan family derived their name, according to Josephus (*Antiq.* xii. cap. 6), from Asamonæus (*Ἀσαμοναῖος*). The son of Asamonæus was Symeon or Simon, whose son Johannes was the father of Mattathias, the father of the Maccabees. The name Asamonæus, or Asmonæus, had probably, like other Hebrew names, a significative meaning; the word השמונים (*Chasmanim*) occurs only once in the Old Testament, in Psalm lxviii. 32. It there means *fat ones*; that is, rich noblemen, princes—grantees who keep many servants. Hence the designation Asmonæans implies nobles or princes emphatically so called. In the chronicles of Rabbi Joseph Ben Jehoshuang, in the Tsemach David of Rabbi David Gans, and other rabbinical writers, the cardinals are called השמונים. The word השמן (*fatness*), occurs as the name of a town in the tribe of Judah (Jos. xv. 27). Chashmonah השמונה,

meaning *fatness*, was one of the stations of the Israelites in the Wilderness. (Num. xxxiii. 29.)

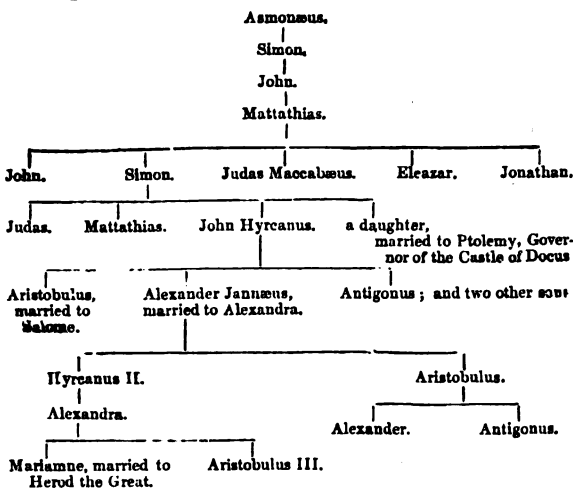

The state of the Jews, while subjected to the Seleucidæ, or Greek kings of Syria, has been compared to that of the modern Greeks under the dominion of the Turks. The Jews, like the modern Greeks before their last revolution, had, during this period, no political existence. Priests were the organ of every interest. The high-priest in Jerusalem, as well as the patriarch of Constantinople, were the heads of their respective nations.

The Jews had for many years been subject to the arbitrary rule and cruelty of the Syrian kings, when Mattathias and his five heroic sons, John, Simon, Judas, Eleazar, and Jonathan, commenced their victorious resistance to the attempt of Antiochus Epiphanes to compel the Jews to exchange their ancestral monotheism for the idolatry of their Syro-Macedonian oppressors. This struggle is described in the books of the Maccabees, which are included among the books of the Apocrypha. It is also detailed in the Antiquities of Josephus, from Book xii. cap. 6, to the end of Book xvi. [See MACCABEES.]

The power of the Asmonæan dynasty lasted from the year B. C. 166 to B. C. 37; but the family survived the dynasty. It arose from the pious heroism of the Maccabees. Their first descendants ruled without the title of king, but with sovereign power: they united in their persons the functions of the high-priest, the chief civil magistrate, and the chief commander of the army. Their power was based upon the grateful esteem of the Jewish nation, which they had restored to independence. The later Asmonæan monarchs adopted the title of king, but they lost, with the pious virtue

of their ancestors, the love of the nation, and subsequently, by family discord, the kingdom itself.

The genealogy of the Asmonean family is as follows:—

After the death of Mattathias, Judas, at the head of those Jews who had fled into the wilderness, made war (B. C. 166) against Antiochus Epiphanes, overcame and killed Apollonius in battle, and thus became chief of his people. The next year he vanquished Lysias and Gorgias, two other generals of Antiochus; he then purified the temple and restored the former worship. Antiochus, having heard of the defeat of his troops, swore that he would destroy the whole nation. As he was hastening to Jerusalem he died miserably, B. C. 164 or 165. Antiochus Eupator, his son, made peace with the Jews, but the war was soon renewed. In a battle against him, Eleazar, one of the younger sons of Mattathias, perceiving an elephant armed with royal harness, and supposing that the king was upon it, ran through the enemy's ranks, crept under the elephant and slew it. The dying elephant fell upon him and crushed him to death. Demetrius Soter having put to death Antiochus, usurped his kingdom, B. C. 162, and conferred the high-priesthood on Alcimus. In a battle against Bacchides, one of the generals of Demetrius, Judas was killed. [See JUDAS MACCABÆUS.] Jonathan succeeded his brother, and after some years of commotion, was made high-priest B. C. 153.

Jonathan entered into an alliance, B. C. 150, with the usurper, Alexander Balas, who pretended to be the son of Antiochus Epiphanes, against Demetrius, who soon fell in battle. Demetrius Nicator, the eldest son of Demetrius Soter, became king of Syria by the death of Alexander, B. C. 146. Tryphon, who wished to give the crown to Antiochus, the son of Alexander Balas, made an alliance with Jonathan; but wishing to usurp the kingdom, and fearing that Jonathan would not suffer it, he killed him by treachery. [See JONATHAN APPHUS.] Simon, B. C. 144, shook off the yoke of the kings of Syria, and took the city of Gaza and the fortress of Jerusalem. He made an alliance with Antiochus Sidetes; but it was soon after broken, and Antiochus sent Cendebeus against him. Simon, now too old to go to war, resigned the command to his sons, by whom Cendebeus was defeated. Ptolemy, the son-in-law of Simon, aspiring to reign in his stead, invited his father and brothers-in-law to a feast, at which both Simon and his sons were assassinated, B. C. 135. [See SIMON MATTATHIAS.] John Hyrcanus, the third son of Simon, not being with him when he was murdered, Ptolemy sent to Gazara, in which place he was, to kill him. John, aware of his design, seized his emissaries and put them to death. Ptolemy now called Antiochus Sidetes to his assistance. They besieged Jerusalem, which being reduced to a state of famine, John was obliged to capitulate. John went afterwards with Antiochus in an expedition against the Parthians; and for his exploits against the Hyrcanians was surnamed Hyrcanus. [See JOHN HYRCANUS.]

Aristobulus, the son of Hyrcanus, became high-priest after the death of his father. Hyrcanus bequeathed the sovereign authority to his wife, but Aristobulus caused her to be shut up; and, contrary to former custom, assumed both the diadem and regal title, B. C. 105. He afterwards undertook an expedition against the Itureans, whom he in a great measure subdued, and introduced among them the

practice of the Jewish religion. Being attacked by illness, he returned to Jerusalem, leaving his favourite brother Antigonus to finish the war. The wife of Aristobulus took advantage of the absence of Antigonus to weaken his influence with his brother; and she endeavoured to excite in her husband's mind the belief that Antigonus sought to obtain the royal dignity. Antigonus, having brought the war to a successful close, returned to celebrate the feast of tabernacles, when Aristobulus summoned Antigonus to his presence. The approach to the palace was by a subterraneous passage. In this Aristobulus planted guards, with orders to despatch Antigonus if he should present himself armed, but to let him pass if unarmed. The wife of Aristobulus, who desired the ruin of Antigonus, privately informed him that the king wished to see him in his armour. Antigonus, entertaining no misgivings, came armed, and was murdered on the spot. The removal of Aristobulus for his brother's murder aggravated his disorder, and he died at the close of the first year of his reign. Three of his brothers whom he had kept in prison were set at liberty on his death. The eldest, Alexander Jannæus, succeeded him in the royal title and office, B. C. 105. [See ALEXANDER JANNÆUS.] Alexander Jannæus reigned twenty-seven years, and was succeeded by his wife Alexandra, B. C. 79. His son Hyrcanus became high-priest. Alexandra reigned nine years. Upon her death, B. C. 70, the government devolved upon Hyrcanus II., a prince of a weak character and inactive disposition. His brother Aristobulus, dreading lest the influence which the sect of the Pharisees possessed over the mind of Hyrcanus should impair the royal authority, gained to his interest the commanders of the fortresses, and having caused himself to be proclaimed king, marched to Jerusalem. Hyrcanus reluctantly went out to meet him. In the midst of the ensuing battle, being abandoned by his soldiers, he threw himself upon the mercy of his brother, who granted him permission to retain the office of high-priest, and allotted him an ample revenue. Hyrcanus consented to resign the regal dignity, but after some time, being assisted by Aretas, king of Arabia, he attempted to resume his former rank. Aretas besieged Jerusalem, and Aristobulus was reduced to great straits; but having gained to his party Scaraus, one of the lieutenants of Pompey, Aretas was obliged to raise the siege and to return to defend his own dominions. Thus commenced the Roman power in Judæa. The authority of Aristobulus had not yet been sanctioned by the Romans; and on the appeal of Hyrcanus, Pompey, having heard the arguments of both parties, decided in favour of Hyrcanus, whom he reinstated in the government under Roman protection. Aristobulus upon this shut himself up in Jerusalem. Pompey besieged the city during three months; and took it at last by fixing his engines on the Sabbath. The Jews would not violate the sanctity of that day by offensive warfare, although they were ready to repel attacks: Pompey accordingly issued strict orders that nothing having the semblance of attack should be suffered to occur, in order that the Jews might have no pretext for disturbing his preparations. Pompey carried Aristobulus to Rome, and made him appear in the triumphal procession which celebrated, among other victories, the Jewish conquest. Aristobulus found means to escape from Rome, and returning to Judæa excited fresh commotion. Gabinus, the Roman general, took him prisoner, and sent him a second time to Rome. On the breaking out of war between Pompey and Cæsar, the latter sent Aristobulus to Judæa to proclaim peace with that country on the part of Cæsar. He was poisoned shortly after by the partisans of Pompey.

The government of Hyrcanus was disturbed by continual commotions, which he had not the ability to prevent. Cæsar gave him many of the neighbouring towns, and allowed him to rebuild the walls of Jerusalem; but Hyrcanus derived little advantage from these concessions, as his minister Antipater, the Idumean, wrested from him all but the name of ruler. Antigonus, the son of Aristobulus, to revenge the death of his father, procured the assistance of the Parthians; coming to Jerusalem with an army he took Hyrcanus prisoner, and, in order to disable him for exercising the sacerdotal functions, cut off his ears. The king of Parthia treated Hyrcanus with humanity, and sent him back to Jerusalem, after Herod had invited him to return. Herod, the son of Antipater the Idumean, being informed that Hyrcanus maintained a correspondence with the chief of the Arabs, caused him to be put to death B. C. 30, &c.

the age of eighty. On the death of Hyrcanus, Antigonus became king; but being soon after besieged by M. Antony, at the expiration of three years from the commencement of his reign, he was put to death by the Romans, B.C. 37, to make way for Herod. Herod had ingratiated himself so much with Julius Cæsar, M. Antony, and the Romans in general, that with their assistance he was enabled to supplant the Asmonæans, and to commence a new dynasty A.D. 37. To confirm his authority, he married Mariamne, granddaughter of Hyrcanus II. and made her brother Aristobulus III. high-priest, reserving to himself the regal power; but finding that Aristobulus retained many partisans, he caused him to be drowned B.C. 35. It is worthy of remark, that the historian Josephus was descended from the Asmonæan family.

Mariamne, who was distinguished by her beauty and talents, was murdered by order of Herod on an unfounded suspicion of conspiracy and adultery. Her sons were also put to death on a charge of rebellious designs. But the Asmonæan family did not end entirely with their power, for we read in the commencement of the auto-biography of Fl. Josephus, 'By my mother I am of the royal blood; for the children of Asamonæus, from whom that family was derived, had both the office of the high-priesthood and the dignity of a king for a long time together. I will accordingly set down my progenitors in order. My grandfather's father was named Simon, with the addition of Psellus: he lived at the same time with that son of Simon the high-priest, who first of all the high-priests was named Hyrcanus. This Simon Psellus had nine sons; one of which was Matthias, called Ephraim: he married the daughter of Jonathan the high-priest, which Jonathan was the first of the sons of Asamonæus, who was high-priest, and was the brother of Simon the high-priest also. This Matthias had a son, called Matthias Curtus, who was born in the first year of the government of Hyrcanus; his son's name was Joseph, born in the ninth year of the reign of Alexandra: his son Matthias was born in the tenth year of the reign of Archelaus; and I was born to Matthias in the first year of the reign of Caius Cæsar. I have three sons; Hyrcanus, the eldest, was born in the fourth year of the reign of Vespasian, Justin in the seventh, and Agrippa in the ninth.' These are the last traces of the Asmonæan family.

The best sources of information concerning the Asmonæan dynasty are contained in *The Five Books of the Maccabees*, with *Notes and Illustrations*, by Henry Cotton, D.C.L., Archdeacon of Cashel, Oxford, 1832. Two of these books belong to the Apocrypha, which are frequently annexed to the Old Testament. See Josephus, *Antiq.* xii. 6—xvi. end.; Comp. גוריון בן יוסף ed. Breithaupt, books iii. and iv., ed. Munster, from the commencement; Franc. Perez. Bayer, de *Numis Hebræo-Samaritanis*, Valentia, 1781, p. 181, fol.; Franc. Perezii Bayer, *Vindicia Numorum Hebræo-Samaritanorum*, 1790, fol.; Ezechielis Spanheimii *Dissertationes de Præstantia et Usu Numismatum*, Lond. 1706. vol. i. p. 61, &c.; *Doctrina Numorum Veterum conscripta a Josepho Eckhel*, pars i. vol. iii, pp. 441—481; *Annales Regum et Rerum Syriæ Numis Veteribus illustrati ab Erasmo Froelich*, *Prolegomena*, pp. 74—91; *Description de Médailles Antiques*, par T. E. Mionnet, tome v. pp. 555—564.

In the British Museum there is a number of Asmonæan coins, from which the following drawings are taken.

[Silver. British Museum.]

[Brass. British Museum.]

The legends of the larger coin, which is of silver, are, if

expressed in the usual square character, שמעון = Shimeon, לחרות ירושלים = to the liberty of Jerusalem.

On the smaller coin, which is of brass, we read—

חרת ציון = liberty of Zion; שנת שתיים = second year.

ASP (*Vipera Haje*, Daudin), a species of noxious serpent, celebrated as the instrument of death which Cleopatra is said to have selected to terminate at once her amours and her existence. The asp (*ἀσπίς*) is often mentioned both by Greek and Roman writers; and from the discrepancies which are observable in the accounts given by different authors, it seems probable that two or three different species of poisonous serpents were known to the ancients under this common name. From various circumstances, however, and particularly from the description of Pliny (*Nat. Hist.* lib. viii. cap. 35.), it is evident that the most common and celebrated is the species to which the modern Arabs give the name of *El Haje*, or *Haje Nascher*. This animal measures from three

to five feet in length: it is of a dark green colour, marked obliquely with bands of brown; the scales of the neck, back, and upper surface of the tail are slightly carinated, and the tail is about one-fourth part the length of the whole body. The haje is closely allied to the cobra capello, or spectacled snake of India, the chief apparent difference being its want of the singular yellow mark on the back of the neck, from which the latter species derives its name. In other respects these two serpents are nearly of the same size; they are equally venomous, and both have the power of swelling out the neck when irritated, and raising themselves upright upon their tails to dart by a single bound upon their enemies. These habits render it probable that the puff-adder of the Cape of Good Hope, so called from its custom of puffing out or distending the neck and throat when disturbed or provoked, is no other than the haje or asp of Egypt, or at least a very closely allied species; but the two animals have never been properly compared, and till this is done the question of their specific difference or identity must remain undetermined.

The poison of the asp is of the most deadly nature. Pliny, in the passage above referred to, gives the following account of this celebrated serpent:—'The neck of the asp is capable of distension, and the only remedy against its bite is the immediate amputation of the wounded part. This animal, otherwise so much to be dreaded, has a sentiment, or rather a kind of affection, truly wonderful. It never lives alone, the male and female being constantly found together, and if one happens to be killed, the other seeks with the utmost fury to avenge its death. It knows and selects the destroyer from among crowds; it follows him to great distances, surmounts every obstacle, and can only be deprived of its revenge by the most speedy flight, or the intervention of some rapid river. It is difficult to say whether Nature has been more prodigal of evils or remedies. For instance, she has

bestowed upon this reptile, so terrible from the deadly effects of its poison, so indifferent a vision, its eyes being placed on the sides of the head so as to prevent it from seeing straight before it, that it is as frequently trodden under foot before it is aware of its danger.' Forskæl, a Swedish naturalist, who has written on the animals of Egypt, informs us that the jugglers of Grand Cairo have the art of taming the haje, as those of India do the cobra capello, and teaching it to dance for the amusement of the populace; taking care, however, to deprive it of its poison fangs, though even then they avoid its bite when irritated. The habit which this serpent has of erecting itself when approached, made the antient Egyptians imagine that it guarded the places which it inhabited. They made it the emblem of the divinity whom they supposed to protect the world; and accordingly they have represented it on their temples sculptured on each side of a globe.

ASPA'RAGI. [See ASPHODELEÆ.]

ASPA'RAGUS, a genus of monocotyledonous plants belonging to the natural order *asphodeleæ*. It is easily recognized by its very narrow leaves, which drop off the branching stem as soon as they begin to wither, by its small greenish-white or yellowish regularly-formed flowers, and by its seeds being enclosed in a pulpy fruit.

Unlike the principal part of monocotyledonous plants, and especially of those which belong to *asphodeleæ*, the stems of the different species of asparagus branch like those of dicotyledons, and even become hard and woody; some of them twine and scramble over other shrubs, and certain species even hook themselves to their supporters by means of their stiff and spiny branches which are stunted and destitute of leaves.

The species are natives of the temperate and tropical regions of the old world, but they are not found wild in either North or South America. The most remarkable one is the common cultivated asparagus which is found in sandy and maritime places in most parts of the middle and south of Europe, the Crimea, and also of Siberia and Japan. It is too well-known a plant to require description, and we shall therefore occupy ourselves exclusively with the method of cultivating it for its succulent and agreeable heads.

An asparagus plant consists of a cluster of fleshy roots connected by the stem, where a quantity of buds are formed, from which branches are yearly emitted. The heads are those branches in a young and tender state; their quality depends wholly upon their size and rapid growth. These are the simplest considerations that are involved in the cultivation of asparagus; the question is how the largest size and the most rapid growth are to be attained.

Seeing what the natural situation of the asparagus plant is when wild, it will be obvious that it should have a light soil which offers little resistance either to the emission of its roots or the protrusion of its stems; the soil should also be capable of both receiving and parting with water readily. Accordingly gardeners take care that all stiff loam, or stones, or solid masses of earth are separated from the soil of their asparagus beds, and that they are completely drained by having trenches 2½ feet deep cut between the beds.

To give vigour to the shoots, manure is added in as great a quantity as the cultivator can afford to apply it; when the seed is sown, or the young plants finally placed in the situation in which they are to produce a crop, an abundant supply of decayed manure, or of bones, or of parings of horses' hoofs, is buried below them; and they are also annually top-dressed with finely pulverized manure, when the beds are arranged in the winter. Attention being paid to these circumstances, asparagus is one of the easiest of all vegetables to cultivate; but no art or skill will produce precisely the soil which is most favourable for its growth. This exists naturally in some places in the fittest of all possible states, and it is there only that it is to be obtained in its greatest perfection; as in the rich alluvial soil of Battersea, Mortlake, and other places round London: in some of these villages it is produced of such extraordinary size that 110 heads in a state fit for the kitchen have been known to weigh more than 32 lbs. There are those who think that this gigantic asparagus is a peculiar variety; but it is ascertained that, on being removed into less favourable soils, it gradually loses its vigour and degenerates into the common kind.

The most convenient breadth for asparagus beds has been found by experience to be 4½ feet, and the least depth or the intermediate trenches 2 feet. The beds are either

planted with seedlings one year or two years old, buried six inches beneath the surface, and standing about a foot apart, or sown at once and the seedlings afterwards thinned to such a distance; the latter method is the most simple and the most effectual.

In this country it is frequently forced, but seldom with much success; the heads being usually small and stringy, without sufficient succulence. For this purpose an asparagus bed is dug up, and the plants transferred to a place heated with dung, where they come up in a fortnight or three weeks; but as the roots are always much injured by the operation of transplanting, the little success that attends this method is easily accounted for. In many parts of the north of Europe, especially about Riga, a far better mode is adopted. The forcing takes place in the asparagus beds themselves without disturbing the roots; the trenches are filled with hot dung, and the beds are covered with the same material about six inches deep; if the weather is very severe, the beds are also covered with frames, but this is rarely necessary in England. Treated thus, asparagus is as fine as if it waited till May to make its appearance. But when this method is practised the heads cannot be cut down at the natural time in the same season. In order to recover from the effect of forcing, they must be allowed to grow as freely as possible during all the succeeding summer, so that they may form a new supply of food for the support of the heads the succeeding spring. Where it is wished to have exceedingly large heads of forced asparagus, pieces of bamboo, or any other hollow tubes, should be put over the shoots when they first make their appearance. The latter will thus acquire a length of as much as eighteen inches without losing their tenderness.

ASPA'SIA. As the select companion and adviser of Pericles, and the associate, and, according to Plato, the mistress, of Socrates, this person claims a degree of notice to which she would perhaps not otherwise be entitled.

Aspasia was a native of Miletus, and the daughter of Axiochus. Of her early life we find no notice. She gained entire possession of the affections of Pericles, who divorced his first wife with her own consent, according to Plutarch, in order to marry Aspasia. We are told little of her beauty; much of her mental powers and cultivation. Plutarch says that Pericles resorted to her 'because she was a wise woman, and had great understanding in matters of government;' and that, in spite of her mode of life, the Athenians who frequented her society used to carry their wives with them to hear her talk. Socrates sometimes visited her in company with his friends. (See Xen. Mem. II. vi. 36; and the *Menexenus* of Plato.) The *Menexenus* is written to introduce a funeral oration ascribed to Aspasia, though the conclusion of the dialogue seems to intimate that the author did not mean that ascription to be implicitly believed. Socrates, however, as one of the speakers in the dialogue, gives Aspasia the high praise of 'having made many good orators, and one eminent over all the Greeks, Pericles, the son of Xanthippus.

ΑΣΠΑΣΙΑ

On this and similar authority we learn that Pericles was indebted to Aspasia for much of that mental cultivation in which he excelled all men of his age. Her moral influence, if the scandalous chronicles of antiquity be true, was less beneficial. She is accused of having led the Athenians

nians by her influence with Pericles, into two wars. One of these was the Samian war, B.C. 440; an interference in behalf of Miletus, the birth-place of Aspasia, to secure to it the possession of Priene, contested by Samos. Thucydides, in his brief account (I. 115), gives no hint that the Athenian leader was guided by any such corrupt influence: he merely says that the Milesians, being worsted, came to Athens, and accused the Samians; their complaints being assisted by a strong desire on the part of the Athenians to render the Samian government more democratical. Aristophanes charges Pericles with having involved the country in a quarrel with Megara, by a non-intercourse act, in revenge for the forcible abduction by some Megarians of two young attendants upon Aspasia. (See *Acharn.* 523, ed. Kust.) Other comic writers, among whom Plutarch names Cratinus, were not slow in taking advantage of her real or supposed influence, and called her the new Omphale, Deianeira, Juno, with epithets of no civil nature appended thereto. Hermippus, the comedian, prosecuted her on the more grave charge of not believing in the gods, and besides, of being instrumental in debauching free women to gratify the lust of Pericles. (See also Plutarch's *Pericles*, c. 24.) We are told on the same authority (that of Plutarch), that nothing but the personal exertions, the tears, and entreaties of Pericles procured her acquittal. These stories, however unfavourable alike to Pericles and Aspasia, depend on the authority of late writers, as Plutarch and Athenæus: contemporary writers contain no hint of them, with the exception of the comic writers, whose trade was scandal. We have no notice of Aspasia's adventures after the death of her lover and patron, except that she transferred her affections to Lysicles, a man of low origin and vulgar mind, who, however, by her instructions, according to Plutarch, became after the death of Pericles for a time the popular leader in Athens. (See Plutarch's *Pericles*, c. 24, 30, 32; and Bayle.)

ASPECT, an astronomical term, now entirely disused, applied to the various positions of the planets with respect to one another, as seen from the earth. The terms *conjunction* and *opposition* are the only two out of five names of aspects which have been retained; the remainder being called *sextile*, *quartile*, and *trine*. At *conjunction* two planets have the same longitude; when sixty degrees apart, he aspect is *sextile*; when ninety, *quartile*; when 120, *trine*; when 180 degrees apart, or opposite, they are in *opposition*. The following are the characters which are used.

Name of Aspect.	Character.	Diff. of Longitude.
Conjunction	♂	0°
Sextile	✱	60°
Quartile	□	90°
Trine	Δ	120°
Opposition	♂	180°

ASPEN. [See **POPULUS**.]

ASPER, or **ASPRE**, a small Turkish coin, and money of account. As a coin it is worth something more than an English halfpenny. The only impression it bears is that of the Prince's name under whom it was struck. Three aspers make a medina. The pay of the Janissaries, when they existed, was from two to twelve aspers per diem.

Kelly, in his *Universal Cambist*, informs us, that at Aleppo and the seaport of Scanderoon, at Cairo, and at Athens in the Morea, accounts are kept in piastres of 80 aspers: at Algiers, in saimes or doubles of 50 aspers: at Constantinople, in piastres, sometimes divided into 80 and sometimes into 100 parts, called aspers or minas: at Samnicia, in piastres of 120 aspers. at Tripoli, in piastres of 52 aspers: at Smyrna, the general division of the piastre is into aspers, the number of which varies. thus the English and Swedes divide the piastre into 80 aspers; the Dutch, French, and Venetians, into 100 aspers; and the Turks, Greeks, Persians, and Armenians, into 120 aspers. (See *Univ. Cambist*, vol. i. pp. 4, 5, 72, 276, 307, 317.)

ASPERGILLUM (in Zoology), a genus of the family Tubicolæ (Lamarck), furnished with a bivalve shell encrusted, as it were, in a tubular testaceous sheath. This tubular sheath gradually lessens in diameter to the aperture which is farthest from the incorporated bivalve. The end nearest to the bivalve is dilated into a concave disk, with a central fissure, and perforated with minute but raised holes. The disk is bordered by a tubular frill. There are but few species: and of these, *Aspergillum Javanum*, known to collectors as 'The Watering-pot,' is the most common.

ASPERN, GREAT, a village in the province of Lower

Austria, situated on an arm of the Danube, nearly opposite to Vienna, but a little to the east of it, and containing about 900 inhabitants. It is celebrated for one of the severest contests which occurred between France and Austria, in the short, though, for the latter of those powers, disastrous campaign of 1809. On the 12th of May in that year, Napoleon had made himself master of the Austrian capital, and the Archduke Charles had, subsequently to his repulse at Eckmühl, taken up a position on the left bank of the Danube, close upon Vienna. Napoleon was not long in possessing himself of two islands in that river, by which he threw his forces across it; and, on the 21st of May, offered his adversary battle from the position he had taken up at the villages of Aspern, Esslingen, and Engersdorf. In this position he was attacked with so much ardour by the Archduke's forces, that both Aspern and Engersdorf were carried before nightfall. Aspern itself, which has since been rebuilt, was converted into a heap of ruins, after enduring thirteen successive assaults. Esslingen and the entrenched island of Lobau however remained in the hands of the French; but the Archduke, having employed the next night in destroying the bridge of communication between the island and the left bank of the river, renewed his attack upon Esslingen the ensuing morning, and ultimately drove General Massena and his broken troops back upon the island. The obstinate gallantry with which the field was contested may be inferred from the loss of the French, which amounted to 30,000, or, according to the Austrian accounts, 41,000 men, in killed and wounded; not more than 3500 prisoners and but three pieces of cannon remained as trophies to the victors. A pyramid was erected by the Austrians with the 3000 French cuirasses which they collected on the spot. Marshal Lannes, with Generals D'Espagne, St. Hilaire, and Albuquerque, fell during this two days' struggle; and Massena, Bessières, and many other generals, were wounded. Never was victory, however, by the sacrifice at which it was purchased and the excess of confidence which it created, more fatal to the fortunes of the conquerors. The battle of Wagram, fought on the 5th and 6th of July following, placed Napoleon in a situation to dictate the most humiliating terms to the Austrian sovereign at Schönbrunn; the cession of one-third of his dominions and the loss of upwards of eight millions of subjects were the price which he paid for a peace with the conqueror.

ASPHALTITES, LACUS. [See **DEAD SEA**.]

ASPHALTUM, (a Greek word, ἀσφαλτος, of unknown etymology,) frequently known by the name of slaggy or compact mineral pitch, is one of the varieties of bitumen, arising from the decomposition of vegetable matter. (See **NAPHTHA**.) It occurs massive, of a dark brown or black colour, with a conchoidal fracture, and a resinous lustre. It is opaque, and exceedingly brittle at a low temperature, but softens and fuses by the application of heat; in density it varies from that of water to 1.6. It may be recognized by the following characters: it is insoluble in alcohol, but soluble in about five times its weight of naphtha, with which it forms a good and useful varnish; its combustion is rapid and brilliant, with the production of the bituminous odour.

It is found in most countries, but most abundantly on the shores, or floating on the surface, of the Dead Sea; at Hit above Babylon, on the Euphrates; near the Tigris: in Trinidad in the West Indies it fills a basin of three miles in circumference and of unknown depth. There is a pitch-spring in Zante, which we know to have been at work for above 2000 years. (See Herod. iv. 195.) It is also found in limestone at Bleiberg in Carinthia; in beds of sandstone in Albania, and in veins in the Hartz in Germany; in Derbyshire, Shropshire, and several other places. It is the principal colouring matter of the dark indurated marl, or shale, which is found in coal districts.

ASPHODELEÆ, or the asphodel tribe, are monocotyledonous plants, which form a very natural assemblage, for the most part easily recognized, although in certain species and genera it approaches other orders so closely as to be distinguished only with great difficulty. They all have regular flowers with three sepals, and three petals of nearly equal size and colour, six (very seldom three) stamens, and a superior three-celled ovary, with only one style. Their fruit is either dry or succulent; and their seeds have a brittle coat.

Asphodeleæ are known from *juncæ*, or the rush tribe, by their larger and more coloured flowers and by the hardness

of the coat of their seeds; from *liliaceæ*, or the lily tribe, by the smallness of their flowers, and the latter character; and from *melanthaceæ*, or the colchicum tribe, by their single style, and by their anthers being turned towards the ovary. They may be formed into two subdivisions.

The first, or the *alliaceous* subdivision, in which there is no true stem, and which consists entirely of bulbous species; the roots being emitted and perishing annually. To this belong the onion, garlic, and their allies, together with the hyacinth, squill, and star of Bethlehem (*ornithogalum*). A great quantity of species are favourites with the horticulturist, on account of their early appearance in the spring and their easy cultivation.

[Asphodelum.]

A plant of *Ornithogalum subvirens*. 1. A flower seen from within. 2. The same viewed from without. 3. The stamens and ovary. 4. Two stamens apart. 5. An ovary. 6. The same cut perpendicularly. 7. The same cut horizontally.

The second subdivision, consisting of the true asphodels and those which resemble them, have no bulbs, but in their stead clusters of fleshy roots such as we find in the asparagus, which belongs to this subdivision; the stems of these are frequently woody, but in that case they are branched: *dracæna*, or the gum-dragon tree, is a most remarkable instance of this, it having almost the appearance of a dicotyledon when deprived of foliage. This subdivision also contains aloes, with their thick fleshy leaves and forked stems.

ASPHO'DELUS, the genus from which the foregoing natural order takes its name, comprehends some handsome hardy perennial plants, with fleshy finger-like roots, and upright undivided annual stems covered with long leaves; they are among the most highly developed of the monocotyledonous plants of northern countries. The most remarkable species are the following:—

A. luteus, or the common yellow asphodel, is a beautiful perennial, very often seen in cottage-gardens, or on the outskirts of shrubberies. It grows wild in Barbary, Sicily, Dalmatia, the Peloponnesus, and even spreads into the Crimea. Its stems are from two to three feet high, never branched, and covered all over with long narrow bluish-green leaves, which have very broad, sheathing bases. The flowers are handsome, deep yellow, with a green streak on the outside of each petal. The fruit consists of red pulpy berries.

Very nearly related to this are, *A. capillaris*, which differs chiefly in its very narrow leaves, shorter bracts, and extremely narrow divisions of the flower; and *A. Sibiricus*, figured in the *Botanical Register*, plate 1507; which is principally known by its dwarfer stature, earlier and paler flowers, more glaucous leaves, and shorter bracts.

A. albus, or the white asphodel, found all over the southern provinces of Europe and the basin of the Mediterranean Sea, is as frequently seen as the first, and in similar situations: its flowers are white with a reddish streak on the outside of each petal, and are disposed in branched clusters.

A. ramosus, of many gardens, seems merely a branched state of this species; and several other reputed species with white flowers are also, in all probability, not distinct.

ASPHYXIA, a Greek word (*ἀσφύξια*) which signifies a cessation of the pulsation, originally expressed any state of disease in which there was a suspension or loss of the heart's action, and a consequent failure of the pulse; but the term is now used to denote a suspension or loss of the power of respiration. The state of asphyxia is that in which the respiratory actions are either temporarily suspended, or have wholly ceased; a state necessarily inducing such a change in the nature of the blood as is incompatible with the continuance of life. The blood which circulates in the two great systems of blood-vessels, veins, and arteries, is essentially different [see BLOOD]; that in the veins is incapable of supporting life; that in the arteries is the proper nutrient and excitent of the system. The object of respiration is to convert venous into arterial blood. The blood returned from the system to the right side of the heart is venous; when it has circulated through the lungs, and thereby been brought into contact with atmospheric air, it is changed into arterial blood. Of all the conditions necessary to the action of vital organs, that of receiving a due supply of arterial blood is the most indispensable. If a ligature be placed around the trachea (windpipe) of an animal, so as completely to prevent the access of air to the lung, and if at the same time the carotid artery be opened, that is, one of the great arteries which springs from the arch of the aorta [see AORTA], and which passing along the neck to the head, is the main channel through which the brain receives its supply of arterial blood, it is found that in a definite time the blood flowing in this artery has ceased to be arterial, and has become venous. Taking the average of a great number of experiments performed on dogs for the express purpose of ascertaining this fact, it is found that in about three-quarters of a minute after the complete exclusion of air from the lung, the blood in the carotid artery begins to lose its vermilion colour. After a minute and a quarter, it has become obviously dark. In the space of a minute and a half, no difference whatever can be perceived between the blood that flows from this artery, and ordinary venous blood: in this space of time, therefore, the system of an animal from whose lung air is excluded is brought completely under the influence of venous blood.

While the blood is thus changing from arterial to venous, the function of the brain is greatly affected. Sensibility diminishes as the blood darkens, and when it has become quite dark the power of sensation is wholly abolished, and the animal lies in a state of profound coma.

The influence of the circulation of venous blood upon the muscular system is no less powerful than that upon the nervous, for the muscle can no more perform its function without the stimulus of arterial blood than the brain. When, in consequence of the exclusion of air from the lung, venous blood is sent out to the system, the heart is always the first muscle that feels the effect of this abstraction of its accustomed stimulus; because venous instead of arterial blood is instantly brought into direct contact with the surface of its left cavities [see HEART], and because venous instead of arterial blood is sent by its nutrient arteries (the coronary, which are the first branches given off by the aorta) into its very substance; and this blood, as has been already stated, is incapable of affording it the requisite nourishment and excitement. Accordingly, the action of the heart is always greatly affected from the very first moment that an animal is brought under this condition. At first its contractions are somewhat accelerated, probably on account of the violent struggles of the animal, and in consequence of the emotion of fear; but in a few seconds its action begins to be arrested, and it becomes rapidly less and less frequent until it sinks to a point surprisingly low. When in a state of health and unexcited, the pulse of a dog is 130 in a minute; but in two minutes after the exclusion of air from its lung, it sinks to twenty-five, and it often falls still lower. Immediately before death it invariably becomes again accelerated, sometimes rising to its natural standard; but what it then gains in velocity it loses in strength, and in all cases within three minutes after the complete exclusion of the air from the lung, the action of the heart has become feeble: this feebleness gradually but rapidly increases, until at the end of the fourth minute it is seldom that the action is at all perceptible by the finger. But though the heart be the first to feel the effect of the abstraction from the system of its

usual stimulus, yet the blood which is transmitted to all the other muscles of the body is alike incapable of exciting them to contraction: the muscles of respiration suffer with the rest, so that the respiratory movements, that is, the alternate enlargement and diminution of the cavity of the chest, indispensable to the entrance and exit of fresh currents of air, cease. In this manner are abolished, though not quite simultaneously, yet in rapid succession, the functions both of respiration and circulation.

As the circulation fails and the pulse sinks, the muscles termed *sphincter*, that is, muscles placed at the mouths of certain cavities in order to close their passage, that their contents may be retained for a given time, are commonly relaxed; the rectum and the urinary bladder evacuate their contents; often violent convulsions now come on, and immediately before the extinction of life the fæces and urine are expelled with great force.

The phenomena attendant on the state of asphyxia, and which are characteristic of it, are now sufficiently manifest. It is impossible to raise the thorax so as to draw in air, that is to inspire; nevertheless, violent though vain efforts are made to accomplish this object; but although no air can be introduced into the lung, yet a small portion can be expelled from it, so that the lung is ultimately brought to the extreme state of expiration. Complete exclusion of the air is rapidly followed by the abolition of sensation, this by the diminution and the ultimate cessation of the heart's action, together with the diminution and ultimate cessation of the respiratory movements; and when these changes have terminated in death, the body remains warm for a very long period; the aspect of the countenance is peculiar; the face is swollen; it is either of a reddish violet hue or of a livid colour, and the eyes are clear, bright, and preternaturally prominent. Shakspeare's description of this state is physiologically correct:

"But, see! his face is black and full of blood;
His eye-balls farther out than when he lived,
Staring full ghastly, like a strangled man.
His hair uprear'd; his nostrils stretch'd with struggling;
His hands abroad display'd, as one that grasp'd
And tugg'd for life, and was by strength subdued."

As the animal heat is longer retained than is usual in leath from other causes, so the coming on of the stiffness consequent on death is longer protracted; but when it has once come on, it is retained for a proportionally longer period.

The morbid appearances in the internal organs observable on dissection are, in the *trunk*, turgescence of the blood-vessels, especially of the veins, which are gorged with blood; the blood itself is preternaturally fluid and of an unusually dark colour. No diseased appearance is commonly found in the cavities of the brain, nor is its substance materially changed from the healthy state. In the *respiratory organs*, the mucous or lining membrane of the larynx, trachea, and bronchi, are unusually red; the bronchial divisions are of a violet or reddish-brown tint; the lungs are of a blackish-brown colour, and when cut into, large drops of a thick, fluid, and very black blood ooze out. In the *organs of circulation*, the heart is the organ chiefly affected. Its veins are gorged with dark blood; ark-coloured blood is found both in its right and in its left cavities, but it is invariably accumulated in a larger proportion in its right than in its left cavities; generally there is at least one-third more in the right than in the left. In the *abdominal organs*, the liver, the spleen, and the kidneys, are gorged with dark and fluid blood. Thus the blood in all the organs of the system is always unnaturally fluid in consistence and dark in colour.

CAUSES. From what has been stated it is obvious that whatever is capable of preventing the admission of air to the lungs, or of arresting the chemical action of the air upon the blood, is capable of producing the state of asphyxia.

I. Various circumstances are capable of acting in the first mode. 1. Whatever affords a mechanical obstruction to the action of the respiratory muscles, as a heavy weight resting upon the chest. 2. Whatever affords a mechanical obstruction to the due expansion of the lungs, while the respiratory muscles still act with the requisite energy, as the accumulation of fluid in the cavity of the chest, or the diminution of the cavity of the chest by the enlargement or displacement of the abdominal viscera. 3. Whatever affords a mechanical obstruction to the entrance of the air into the lung, as the application of a ligature around the wind-pipe, causing *angulation*; the submersion of the body in water, or drown-

ing; the introduction of foreign bodies into the larynx, trachea or its divisions, the brouchi exposure to a too rarefied atmosphere, or to irrespirable gases, such as nitrogen, hydrogen, carburetted hydrogen, carbonic acid gas, &c.

II. The circumstances which are capable of producing the state of asphyxia, by arresting the chemical action of the air upon the blood, are either what may be termed mechanical or vital. The mechanical are those which act in the mode just adverted to, namely, by preventing the entrance of air into the lung, as suspension, submersion, and so on. The vital are those which act chiefly through the medium of the nervous system. If injury be done to the organic nerves which supply the lungs, or if from any cause the nerves of this class fail to supply the lungs with the nervous influence which it is their office to afford, the requisite changes in the blood do not take place. Such an injurious effect upon this class of nerves may be brought about gradually and progressively by the long-continued action of intense cold upon the system, or may be produced instantaneously by a stroke of lightning. The like cause may also act through the nervous system upon the respiratory muscles, stopping the action of what may be termed the mechanical portion of the respiratory apparatus, namely, the alternate enlargement and diminution of the thoracic cavity. Injury done to the other great division of the nervous system, the sentient; injury or division of the eighth pair of nerves; injury or pressure upon the upper portion of the spinal cord (the *medulla oblongata*); injury or pressure upon the spinal cord itself, and especially upon that portion of it which is placed in the neck, whether from fracture or from dislocation of the bones of the spinal column, may destroy the contractility of the respiratory muscles, and thus stop the respiratory movements. It often happens that both sets of causes are combined; the contractility of the muscles of respiration being destroyed by the operation of the same causes which abolish the nervous energy of the lungs.

There are certain varieties of asphyxia which, on account of their practical importance, being states of continual occurrence from accident and otherwise, require a separate consideration. The more important of these are drowning, hanging, strangulation, and suffocation. The physiological condition of the system is the same in each of these varieties of asphyxia; but there is a treatment suitable to each, which will be better explained under its appropriate head. [See DROWNING, &c.]

ASPIRATE, a name given to one of the divisions of consonants. Grammarians have generally avoided any formal definition of the principle which characterizes this or the other classes of letters; they have generally deemed it sufficient to enumerate those letters which belong to each class, and to assign names to these classes without giving any reason for the selection. The subject is confessedly one of difficulty, and it is therefore with much doubt that the following system is proposed. In the pronunciation of the letters called *tenués*—viz., *h, t, p*—the moveable organ, whether tongue or lip, comes into the minimum of contact with the organ struck, whether palate, teeth, or lip, and the stroke is rapid. In the pronunciation of the *medials*—*g* (as in *goose*), *d, b*—the surface of contact is greater, the contact itself closer, and of longer duration. Lastly, in the utterance of the aspirated letters, the organs are brought more or less closely together through the whole breadth of the mouth, so that the vibration of air passes through a long narrow fissure. If the pressure or approximation be of slight intensity, and of short duration, the series of aspirates, *y, ch* (as at the end of German or Scotch words), *th* as in *thing, ph, w* are produced. If the pressure be closer and more lasting, there result the aspirates *gh, th* as in *this*, and *v*. The former series might perhaps deserve to be called aspirated *tenués*; the latter, aspirated *medials*. The sibilants again seem to have a claim to be admitted under the genus aspirate. If this claim be allowed, *s* as in *such, sh* (or *ch* of the French *chemin*), *j* as in the French *jour*, may be called the sibilant *tenués*; and *ch* (as in the English *church*), *j* (as in the English *journey*), are the corresponding medial sibilants. The letter *h*, which has been omitted in our series, is only a faint *ch* (as pronounced by the Germans). Indeed, if the pedigree of this letter be traced upwards, it will be found to terminate in the Hebrew *chet*. [See ALPHABET, pp. 379, 380.] In the comparison of cognate languages, it is important to bear in mind—first, that the aspirated letters are often convertible with one another;

and secondly, that they are severally interchangeable with the medials and tenues of the same organ. Thus, 1st, *ch* of the Greek language often corresponds to *h* in the Latin: *cheim* (χημ-ων, χεμ-εινός) Gr., *hiem-s* Lat., *winter*; *cha-mai* Gr., *humi* Lat., *on-the-ground*; *cha* (χα-ακυν) Gr., *hia-re* Lat., *to gape*. [See GUTTURALS.] 2. *h* in Greek corresponds to *s* in Latin, *hepta* Gr., *septem* Lat., *seven*; *hex* Gr., *sex* Lat., *six*; *huper* Gr., *super* Lat., *above*, (*upper*.) 3. *th* in ordinary Greek to *ph* or *f* in the Æolic dialect and Latin; *ther* ord. Gr., *pher* Æolic Gr., *fera* Lat., *a wild beast*; *thlib* ord. Gr., *phlib* in Homer, *press*; *thura* Gr., *a door*, *fora-s* Lat., *out of doors*; *tharsus* (or *thrasus*) Gr., *fortis* Lat., *bold*; *thre* Gr., *fle* Lat., *bewail*. 4. *th* into *s*, as *sios*, *god*, in the Laconian dialect, instead of *theos*. 5. *th* in ordinary Greek to *ch* in other dialects: *ornith* ordinary Greek, *ornich* Doric, *a bird*. Hence in the same language *ith* (ιθ-μα) and *ich* (ιχ-voc) enter into the two forms which signify *a step*; *erch* and *ellh* into the two forms of the verb signifying *to go*, *ερχομαι*, *ελθω*. Hence too the different forms of the Greek and Latin names for Carthage, *Curchedon* Gr., *Carthagon* Lat., in which the second interchange of *d* and *g* compensates for the inverse change of the aspirates *ch* and *th*. 6. *f* in Latin corresponds to *h* in Spanish, *fabu* Lat., *huba* Sp., *a bean*; *fabula-ri* Lat., *habla-r* Sp., *to talk*; *far-ere* Lat., *hac-er* Sp., *to do*; *fato* (*fatum*) Lat., *hado* Sp., *fute*; *formoso* (*formosus*) Lat., *hermoso* Sp., *beautiful*. For the relation of *sw* and *w* with *h*, see DIGAMMA.

Secondly, the several aspirates are, as above stated, interchangeable with the medials and tenues of the same organ. Examples of these changes will readily suggest themselves in every language. The most deserving of attention are perhaps those which exist between the English and German:

initial *h*, in German, corresponds to *ch*, *sh*, in English.

final <i>g</i>	"	"	<i>w</i> , <i>y</i> ,	"
final <i>ch</i>	"	"	silent <i>gh</i> , <i>ch</i> , <i>k</i> .	"
final <i>t</i>	"	"	<i>th</i> , <i>d</i> ,	"
initial <i>d</i>	"	"	<i>th</i> in <i>think</i> .	"
final <i>d</i>	"	"	<i>th</i> in <i>the</i> .	"
<i>th</i>	"	"	<i>d</i>	"
initial <i>z</i>	"	"	<i>t</i> ,	"
final <i>tz</i> , <i>ss</i>	"	"	<i>t</i> ,	"
final <i>b</i>	"	"	<i>v</i> , <i>f</i> ,	"
<i>pf</i>	"	"	<i>p</i> ,	"
final <i>f</i>	"	"	<i>p</i> ,	"
initial <i>v</i>	"	"	<i>f</i> ,	"

(See Grimm's *Deutsche Grammatik*, or Becker's *German Grammar*, English edit. p. 26.)

ASPOE, a small island, situated in the Gulph of Bothnia, belonging to the Russian province of Finland. It forms a parish, has a light-house, and contains about a hundred Finlanders. 60° 17' N. lat., 26° 77' E. long. (Klint.)

ASPREDO, in zoology, a genus of abdominal malaco-pterigian fishes, characterised by the horizontal flatness of the head, and the enlargement of the anterior part of the trunk, arising from an unusual development of the bones of the shoulder. They are further distinguished from the Silures of Linnæus (from which extensive genus, indeed, they were originally separated by that great naturalist himself) by the proportional length of the tail; by having the eyes placed in the upper surface of the head, and the intermaxillary bones concealed beneath the ethmoid, directed backwards, and furnished with teeth only along their posterior margin; and finally, they are remarkable as being the only known fish, not being cartilaginous, which have not moveable opercula, the bones of which these organs are composed being soldered on either side to the tympanum and preoperculum. The opening of the gills is consequently formed by a single slit in the skin immediately behind the posterior side of the head; and their membrane is composed of six branchiostegous rays. The lower jaw is transverse, and the upper projects considerably beyond it, and forms a small attenuated muzzle. There is but a single dorsal fin, which is of small extent, and situated on the fore-part of the body: the anal fin, on the contrary, is very large, and occupies the entire length of the tail. This genus contains out very few species, the principal of which, the *Silurus Aspredo* of Linnæus, inhabits the rivers and lakes of North America.

ASPROPOTAMO. [See ACHELOUS.]

ASS, a well-known and useful domestic animal, whose good qualities are too frequently undervalued, from being

contrasted with those of the horse, without considering the different nature of the treatment which these two quadrupeds receive—the care and attention bestowed upon developing the form and cultivating the spirit of the one, and the neglect and ill-usage to which the other is so generally subjected. Buffon has well observed, that the ass is despised and neglected only because we possess a more noble and powerful animal in the horse; and that, if the horse were unknown, the care and attention which is lavished upon him, being transferred to his now neglected and despised rival, would have increased the size and developed the mental qualities of the ass to an extent which it would be difficult to anticipate, but which eastern travellers, who have observed both animals in their native climates, and among nations by whom they are equally valued, and the good qualities of each justly appreciated, assure us to be the fact. Indeed, the character and habits of these two quadrupeds are directly opposed in almost every respect. The horse is proud, fiery, and impetuous, nice in his tastes, and delicate in constitution; like a pampered menial, he is subject to many diseases, and acquires artificial wants and habits, which are unknown in a state of nature. The ass, on the contrary, is humble, patient, and contented with scanty and coarse fare which other cattle reject; he bears with patience and fortitude the most cruel and oppressive treatment; yet he is more susceptible of strong attachment than the horse, has apparently more prudence and reflection, and is capable of a degree of education which would not be anticipated from the forlorn and dejected appearance which coarse food and harsh treatment have rendered habitual to him. In Persia, Arabia, and other eastern countries, however, the ass is a very different animal from what he is in Western Europe. There, instead of being neglected and despised, half-starved, and treated with cruelty, care is taken to cultivate the breed by crossing the finest specimens; even the wild ass is procured for this purpose, the pedigrees of the different races are carefully recorded, and the size, strength, and symmetry of the ass so much improved, that he is rendered equal to the horse for most purposes, and in some cases even his superior. 'The asses of Arabia,' says Chardin, 'are perhaps the handsomest animals in the world; their coat is smooth and clean; they carry the head elevated, and have fine and well-formed legs, which they throw out gracefully in walking or galloping. They are used only for the saddle, and are imported in vast numbers into Persia, where they are frequently sold for four hundred livres; and being taught a kind of easy, ambling pace, are richly caparisoned, and used only by the rich and luxurious nobles.'

The ass is, properly speaking, a mountain animal; his hoofs are long, and furnished with extremely sharp rims, leaving a hollow in the centre, by which means he is enabled to tread with more security on the slippery and precipitous sides of hills and precipices. The hoof of the horse, on the contrary, is round and nearly flat underneath, and we accordingly find that he is most serviceable in level countries; and indeed experience has long since taught us that he is altogether unfitted for crossing rocky and steep mountains. As, however, the more diminutive size of the ass rendered him comparatively less important as a beast of burthen, the ingenuity of mankind early devised a means of remedying this defect, by crossing the horse and ass, and thus procuring an intermediate animal, uniting the size and strength of the one with the patience, intelligence, and sure-footedness of the other. The mule, indeed, appears to have been known at a very early period; and if we may believe an extract from the works of Mago, a Carthaginian writer on Husbandry, preserved by Columella, it would even seem that instances were not rare in Northern Africa of this animal being fruitful, and continuing its species: a phenomenon, however, which was as unknown among the Greeks and Romans as it is at the present day.

If any reliance can be placed upon negative evidence deduced from the writings of Moses, it would appear that the ass was a common domestic animal among the nations of Western Asia, many ages before the horse was reduced to subjection. The earliest express mention which the sacred historian makes of any kind of cattle subsequent to the deluge, is on the occasion of Abraham's visit to Egypt, when, to use the words of Scripture, 'Pharaoh entreated him well for Sarah's sake; and he had sheep, and oxen, and *he-asses*, and maid-servants, and *she-asses*, and camels. No allusion is here made to the horse; and it is not pro-

bable that Pharaoh would have neglected to include this noble and useful animal among the other riches which he bestowed upon Abraham, if the Egyptians themselves had possessed it in a state of domestication; nor is it likely, if he had, that the sacred historian, so minute in other particulars, would have passed over this in silence. The conclusion therefore would appear to be, that in the time of Abraham the horse was not domesticated in Egypt. It appears further, from the catalogue of Abimelek's presents to Abraham, from the enumeration of Abraham's effects on the marriage of his son Isaac, from the catalogues of Jacob's riches, of his present to his brother Esau, and of the spoils taken from the city of Sechem, that the horse was unknown to the Syrian nations for many ages after the time of Abraham; but on all these occasions the ass is invariably mentioned among the other species of domestic cattle which constituted the wealth of the patriarchs. Though thus early domesticated in the East, it was long before the ass was introduced among the inhabitants of Western Europe. Aristotle assures us that in his time there were no asses in Pontus, Scythia, or in the country of the Celts, that is in modern Germany and France; and we know that even in the time of Elizabeth this animal was extremely rare in England.

The wild ass, called Koulan by the Persians, is still common in many parts of Central Asia. It stands much higher on its limbs than the common ass, its legs are longer and more slender, and it is altogether a more graceful and symmetrical animal. The mane is composed of short erect hair, of a dusky colour, and rather a woolly texture; the colour of the body is a uniform silvery grey, with a broad coffee-coloured stripe extending down the back, from the mane to the tail, and crossed on the shoulder by a transverse band, as in the domestic variety. The Koulan inhabits the parts of Central Asia, from the 48° of north latitude to the northern confines of India. They migrate from north to south according to the season. In summer they are commonly found about lake Aral, but in autumn they collect in vast troops under the conduct of a regular leader, and proceed towards the south, arriving at Cutch and Guzerat in October or November, and returning northward again in the middle of spring. The Persians and Tartars hold the flesh of the Koulan in high esteem, and hunt it in preference to all other descriptions of game. Olearius assures us that he saw no fewer than thirty-two wild asses slain in one day by the Schah of Persia and his court, the bodies of which were sent to the royal kitchens at Ispahan; and we know from Martial, that the epicures of Rome held the flesh of the Onager, or wild ass, in the same estimation as we do venison.

Cum tener est Onager, solaque liliis matre
Pasditur: hoc infans, sed breve nomen habet.

Martial, xlii. 97.

From a passage in Pliny (lib. viii. c. 44) it would appear that the Onager inhabited Africa, and that the most delicate and best flavoured lalisions, or fat foals, were brought from that continent to the Roman markets. Leo Africanus repeats the same story of wild asses being found in Africa, but no traveller has since met with them, and, as far as we at present know, the species is confined to Asia. It has even retired from Syria and Asia Minor, where it was formerly found. [See HORSE.]

ASSAFŒTIDA (in Botany). [See FERULA.]

ASSAFŒTIDA is a gum-resin, obtained from the roots of the *Ferula assafœtida*, a perennial plant growing in Persia, in Khorassan, and in the province of Lar. In its recent and purest state it is white and transparent, but by exposure to the air it becomes of a clear brown colour, sometimes verging to red or violet, and of a waxy appearance. At the ordinary temperature of the air it is of the consistence of wax, slightly viscid or glutinous, and becoming soft with the heat of the hand, by which the grains are united into smaller or larger lumps, which, when broken, contain many almond-like pieces. The portions which correspond to this description constitute the best kind of assafœtida, which is called assafœtida in grains.

The inferior sort is dark-brown, of a dull, fatty appearance, viscid, and greasy, containing portions of the stalks, and other impurities: it is called assafœtida in masses.

Sagapenum, the source of which is unknown, is by many supposed to be a kind of assafœtida.

The smell of assafœtida is penetrating, very disagreeable, and lasts some time. The taste is bitter, unpleasantly aro-

matic, of an alliaceous or garlic-like character. Its chief component parts are volatile oil, resin, and gum; and it is soluble in vinegar, proof-spirit, and yolk of egg. Triturated with water, it forms an emulsion, from which the resin is gradually precipitated. Assafœtida can only be powdered at the temperature of freezing (32° of Fahrenheit); but even after being powdered, though kept in a cool place, it is apt again to run into masses.

An artificial assafœtida is sometimes formed of resin and garlic juice; but this has only a weak smell, and is more perfectly soluble in alcohol.

Assafœtida acts on the human system as a stimulant, more especially of the nerves of the chest and abdomen. It also influences, like all gum-resins, the vessels distributed on the lower portion of the abdomen, or the pelvis. Though not so heating as its chemical composition might lead us to expect, it not only directs the blood more powerfully to these organs, but ensures its uniform supply. It is also a valuable antispasmodic, in irregular action of the muscles either of the respiratory or digestive organs.

Its power of at once rousing the nervous system and promoting the flow of blood towards the enfeebled stomach and bowels, render it very serviceable in imperfect digestion, attended with constipation.

From a knowledge of its powers in such cases, the Romans employed it along with their food, as the Persians still do.

In hysteria it is extremely useful, both during an attack of spasm, and during the interval between the paroxysms.

In colic, and even ileus, its action is often rapid and effectual, especially if thrown into the rectum: in this way cases of the most obstinate constipation, especially in hysterical females, have yielded to it.

In asthma, in the later stages of hooping-cough, and in the cough of old age, in cough occurring in weakly subjects, not connected with inflammation or tubercles, above all, in the cough of hysterical females, it is of very great service. In the last-mentioned case, it is improved by combination with myrrh and preparations of iron, as it likewise is when employed to act on the uterine system.

It is also employed externally, as a means of keeping up counter-irritation; and a convenient plaster may be formed by adding 1-12th part of camphor to 11-12ths of assafœtida. For internal exhibition, pills, or tincture, or watery solution (which must be used immediately after it is prepared) are the ordinary forms of administration. In cases of organic disease of the heart, especially enlargement, and in fulness or congestion of the brain or spinal chord, or in any organic disease of these, assafœtida is improper.

ASSAHAN, a district and town situated on a river of the same name, in the Batta country, on the north-east coast of Sumatra. The town is in 3° 1' N. lat. and 99° 52' E. long. The river, which is above 4000 feet wide at its mouth, is shallow, and is rendered difficult of access by an extensive sand-bank. The Portuguese had formerly a settlement up the Assahan river, and the remains of an old fortification still exist, about 70 miles from its entrance, where a colony of emigrants from Java was once established.

The commerce of Assahan was formerly very considerable, but has now much declined. It is principally carried on with the Malays of the opposite peninsula, and with the English settlements of Penang and Singapore. The articles of import are salt, opium, cotton goods, muskets, and gunpowder. The exports are various—dye-woods, rattans, wax, rice, and horses. A trade in slaves was formerly carried on from Assahan. As many as 300, mostly females, have been sent away in one year to Malacca; and it is curious to observe the small comparative value then placed upon human beings in the Eastern markets, where a horse sold for thirty dollars, while the price demanded by the merchants for their fellow-creatures varied, according to age and bodily capability, from twelve to forty dollars per head. Happily this trade has partaken of the general commercial depression.

The population of the whole district was estimated in 1822 at 70,000. Some, but not all, of the tribes who make up this number, are said to be addicted to cannibalism. (See Hamilton's *East India Gazetteer*.)

ASSASSINS, a military and religious order, formed in Persia in the eleventh century. It was a ramification of the Ismaelites, who were themselves a branch of the great Mohammedan sect of the Shiites, the supporters of the claims of Ali's posterity to the caliphate. [See ALI BEN ABI TA-

LEB.] But among the Ismaelites there were many who were Mussulmans only in appearance, and whose secret doctrine amounted to this: that no action was either good or bad in itself, and that all religions were the invention of men. These unbelievers were formed into a secret society by one Abdallah, a man of the old Persian race, who had been brought up in the religion of the Magi, and was a hater of the Arabs and of their faith. After several bloody insurrections against the Abbaside caliphs, the Ismaelites succeeded in placing on the throne of Egypt a pretended descendant of Ismael, the seventh Imaum in the line of Ali, from whom the Ismaelites had taken their name. [See ISMAELITES.] This descendant, whose name was Obeid Allah Mehdee, was the founder of the Fatemite dynasty, so called from Fatema, Mohammed's daughter. Under the protection of these princes a lodge of the secret doctrine was established at Cairo, and its members spread over a great part of Asia. Their ostensible object was to maintain the claims of the Fatemite caliphs to universal dominion, and to urge the destruction of the caliphs of Bagdad as usurpers. One of the adepts, Hassan ben Sabah, thought of turning these instruments to his own advantage. He had filled high offices under the sultan of the Seljuide Turks, but on being disgraced, he went to Egypt, where he was received with distinction by the caliph, became a zealous adherent of the Ismaelite lodge, and after many vicissitudes and wanderings obtained possession, by the aid of his brethren, of the hill-fort of Alamoot (or *vulture's nest*), situated to the north of Casvin, in Persia, and there (A.D. 1090) established an independent society or order, consisting of seven degrees, with himself at the head as sheikh al Jebel, *i. e.*, sheikh of the mountain. Under him came three dai al kebir, the grand priors of the order; 3dly, the dais, or initiated masters; 4thly, the refekes, or companions; 5thly, the fedavees, or devoted; 6thly, the laseeks, aspirants or novices; 7thly, the prophane, or common people. Hassan drew out for the dais, or initiated, a catechism consisting of seven heads, among which were—implicit obedience to their chief; secrecy; and lastly, the principle of seeking the allegorical and not the plain sense in the koran, by which means the text could be distorted into anything the interpreter pleased. This did away effectually with all fixed rules of morality or faith. But this secret knowledge was confined to a few; the rest were bound to a strict observance of the letter of the koran. The most effectual class in the order were the fedavees—youths often purchased or stolen from their parents when children, and brought up under a particular system of education, calculated to impress upon their minds the omnipotence of the sheikh, and the criminality as well as utter impossibility of evading his orders, which were like the mandates of heaven itself. These fedavees were clothed in white, with red bonnets and girdles, and armed with sharp daggers; but they assumed all sorts of disguises when sent on a mission. Marco Polo gives a curious romantic account of the garden at Alamoot, to which the fedavee, designed for an important mission, was carried in a state of temporary stupor produced by powerful opiates, and where, on awakening, he found every thing that could excite and gratify his senses. He was made to believe that this was a foretaste of the paradise of the prophet, reserved for his faithful and devoted servants, and thus became willing to encounter death, even under the most appalling forms, in order to secure a permanent seat in the abode of bliss. Marco Polo's narrative is confirmed by Arabian writers, and Von Hammer inclines to believe it true in the main; others attribute the visions in the garden to the effects of the intoxicating preparation administered to the fedavees. The name of *hashish*, which is that of an opiate made from hemp-leaves, is supposed to have been the origin of the word 'Assassins'; others derive the latter from Hassan ben Sabah, the founder of the order. The word becoming familiar to the crusaders was by them carried to Europe, where it was used as synonymous with that of *sicarius*, or hired murderer; but the Italians have adopted it to signify a robber on the high road, without necessarily implying the crime of murder.

The Assassins, either by force or treachery, gained possession of many other castles and hill-forts in Persia. The sultan Melek Shah attacked them, the doctors of the law excommunicated them, but the fedavees carried secret death among their enemies; the sultan's minister, Nizam ul Mulk, was stabbed, and his master soon after died suddenly, it was supposed by poison. The Assassins spread into Syria, where they acquired strongholds in the mountains near

Tripoli; and the sultan of the Seljuides was glad to come to an agreement by granting them several districts. Hassan ben Sabah having extended his order over great part of the Mohammedan world, died at Alamoot in 1124, after thirty-five years' reign. He bequeathed his authority to Keah Buzoorg Oomeid, one of the dais of the order. Buzoorg renewed the war with the Seljuides, and Abous Wefa, his Dai al Kebir in Syria, entered into a temporary alliance with Baldwin II. king of Jerusalem, through the agency of Hugo de Payens, grand master of the Templars, against their common enemies the Seljuide Turks. After this, the Assassins were sometimes on friendly terms, but oftener at variance, with the Christian princes of Syria and Palestine, as well as with their Mohammedan neighbours. To accomplish their object they never scrupled to resort to assassination. In 1126 the prince of Mosul was stabbed as he entered the mosque by Assassins disguised as dervises; soon after, a caliph of Bagdad was killed likewise, and also a sultan of Cairo, notwithstanding his Fatemite descent. In 1151 Raymond count of Tripoli was stabbed by the Assassins; it was suspected, at the instigation of his wife. At this time the Syrian branch of the Assassins had become in a manner independent of the Persian one. The sheikhs of the latter, successors of Buzoorg, continued to reside at Alamoot, but they were weak and profligate: one of them, Hassan, who had the rashness to disclose in public the mysteries of the order, was murdered by his son Mohammed, who was himself poisoned by his son Jellal-ed-deen, who succeeded him in 1177. Jellal-ed-deen was a man of more sense than his predecessors; he made his peace with the caliph, sent his harem on the great pilgrimage to Mekka, and received the appellation of New Mussulman. After a short but peaceful reign he was succeeded by his son Aladdin, who, being murdered, the office of sheikh al Jebel devolved upon Roked-ed-deen, Aladdin's son. By this time the caliph of Bagdad had applied to the great Mongol conqueror, Mangoo Khan, who sent his brother Hulakoo to exterminate the murderous sect. Alamoot was taken, and Roken-ed-deen was made prisoner; the fortress Kirkood resisted for three years, but at last all the haunts of the Assassins were taken, and the inmates were massacred without distinction, A.D. 1256.

The Syrian or western branch of the Assassins, however, continued to exist for some years later under their Dai al Kebir. Massyad, not far from Beyroot, was their principal stronghold. The history of this branch is the most familiar to Europeans, being much interwoven with that of the crusaders and of the great Sultan Sala-ed-deen. The latter was several times in danger from the daggers of the Assassins. The Dai al Kebir Sinan, a man who had a reputation for sanctity, sent in 1173 an embassy to Almeric, the Christian king of Jerusalem, offering, in his name and that of his people, to embrace Christianity, on condition that the Templars, who were their neighbours, should remit the annual tribute of two thousand gold ducats which they had imposed on them, and live in future in peace and good neighbourhood toward them. Almeric was delighted with the offer, and dismissed the envoy with honour. The envoy, however, on his return to his territory, was killed by a party of Templars, led by Gaultier du Mesnil. After this the Assassins resorted again to their daggers, which they had laid aside for many years. Among other victims, Conrad, marquis of Tyre and Montferrat, was murdered by two fedavees in the market-place of Tyre, 1192. The reasons for this murder, which some have ascribed to Richard of England, have been the subject of a long controversy, which Von Hammer does not succeed in elucidating. The Assassins kept the Christians of Tripoli in perpetual fear. They levied contributions on the Christian princes for the safety of their lives; and they even demanded it of St. Louis, king of France, on his passing through Acre on his return from the Damietta expedition. Louis, however, indignantly refused. At last the Syrian Assassins were conquered, and their stronghold taken, by Bibars, the Mamluke Sultan of Egypt, fourteen years after the destruction of the eastern branch by the Mongols. Many, however, found refuge in the mountains of Syria, and became mixed with the Yezed Koords; and some of the tenets of the order are believed to linger still among them. (Hammer, *Geschichte der Assassinen*; also Sir John Malcolm's *History of Persia*; and Wilken's *History of the Crusades*.)

ASSAULT and BATTERY. An assault has been commonly defined to be 'an attempt or offer with force and

violence to do a corporal hurt to another.' Thus, presenting a gun at a person within the distance to which it will carry, throwing a stone or other missile at him, drawing a sword and waving it, or even holding up a fist in a threatening manner, are given as instances of assault. An assault does not necessarily imply any corporal injury done to the party assaulted; pointing or snapping a loaded gun at a person behind his back, so that he is not aware of his danger, would be an assault, though no actual injury is sustained. But it has long been settled law, that no words, however insolent and provoking, unaccompanied by an act of violence, can amount to an assault.

A *battery*, which is said to imply an assault, consists of any kind of corporal injury, however small, designedly done to another by an actual contact with his person. The injury need not be done by the immediate hand of the party; nor is it material whether the act is wilful or not, provided it proceeds from a mischievous design. Thus, in a case where a lighted squib was thrown into a market-place, which was tossed about from hand to hand and at last struck a man in the face and put out his eye, it was holden to be an assault and battery by the first thrower.

A person who commits an assault and battery is liable to an action of trespass by the party injured, and also to a criminal prosecution for a misdemeanor and breach of the peace; but the proceeding by indictment and action for the same assault is always discouraged in practice, and where a defendant is found guilty upon an indictment, and the court is informed that an action has been brought for the same injury, a nominal sentence is usually passed, unless the prosecutor will consent to discontinue his action.

It is not uncommon to permit the prosecutor of an indictment for a common assault to compound the offence with the defendant even after he has been convicted; and upon the declaration of the former that he is satisfied, a nominal punishment only is imposed. This practice, which is called *speaking with the prosecutor*, has been introduced for the purpose of reimbursing the person really injured the expenses of the prosecution, and of compelling the offender to make him some compensation, without the circuity of a civil action. Though sanctioned by long usage, it is a relaxation of the strict rules of the criminal law, and is liable to much objection in principle, as enabling an individual to assume the character of a public prosecutor for the purpose of redressing a private wrong. This objection to her practice has been strongly animadverted upon by Mr. Justice Blackstone, and it is now much less frequent than formerly. (Blackstone's *Commentaries*, vol. iv. p. 363.)

The punishment of persons convicted of common assaults is fine and imprisonment at the discretion of the court, exercised upon the circumstances of each particular case. By a variety of statutes, assaults aggravated with respect to the place where, or the persons on whom, they were committed, were formerly punishable with great severity; most of these statutes were, however, repealed by the stat. 9 Geo. IV. c. 31, which authorizes an increased punishment upon certain specified cases of aggravated assaults. Thus, persons convicted of assaulting magistrates, officers, or other persons concerned in preserving wrecks, are, by the 4th section of that statute, liable to be transported for seven years, or to be imprisoned, with or without hard labour, at the discretion of the court. So also, by the 25th section, persons convicted (1) of any assault with intent to commit a felony; (2) of any assault upon a peace or revenue officer in the execution of his duty; (3) of any assault with intent to resist the lawful apprehension of the party assaulting for any offence against the law; (4) of any assault committed in pursuance of a conspiracy to raise wages, may be imprisoned, with hard labour, for any term not exceeding two years.

The statute of 33 Henry VIII. c. 12, which punishes assaults in the king's palaces with the loss of the right hand and perpetual imprisonment, has been repealed by the above statute of the 9 Geo. IV. c. 31; but it seems that the penalty of the loss of the right hand attached by the common law to assaults committed in the actual presence of the king, or in his constructive presence in the superior courts of law, still remains. This subject was much discussed in a case which occurred in 1799, when the Earl of Harriet, and several other persons, were convicted of a riotous assault and rescue in a court of Oyer and Terminer and Gaol Delivery at Maidstone. Upon their being brought for judgment, the court of King's Bench entertained

doubts whether it was not imperative upon them to pass the specific sentence of amputation; but the attorney-general entered a *Noli prosequi* as to those parts of the charge upon which the doubts had arisen. (See Howell's *State Trials*, vol. 27, p. 822.)

Actions for trivial assaults were formerly among the most frequent subjects of litigation in our courts of justice; and in order to discourage them, it was enacted by the statute of 22 and 23 Car. II., c. 9, that 'in all actions of assault and battery, wherein the judge at the trial of the cause shall not certify upon the record that an assault and battery were sufficiently proved, the plaintiff, in case the jury shall find the damages to be under 40s., shall recover no more costs than the damages so found shall amount unto.'

By a recent statute (9 Geo. 4, c. 31, sect. 27), persons guilty of common assaults may be convicted summarily by two magistrates, who are empowered to impose a fine not exceeding 5*l.*, with the costs; and in case of non-payment, to commit offenders to prison for two months. By the 28th section of the same statute, a certificate under the hands of the convicting magistrates that the complaint was dismissed as trivial, or that the assault complained of was justified, or payment of the fine adjudged, or completion of the term of imprisonment for non-payment thereof, shall be a bar to all further proceedings, criminal or civil, for the same cause.

ASSAYING, a chemical operation, which differs from analysis only in degree. When an analysis is performed, the nature and proportions of all the ingredients of a substance are determined; but in assaying, the quantity of any particular metal only which the ore or mixture under examination may contain is ascertained, without reference to the substances with which it is mixed or alloyed.

The operations of assaying are sometimes conducted entirely in what is called the *dry way*, or by heat; at other times in the *moist way*, or by acids and other re-agents; and in some cases both methods are necessarily resorted to in assaying the same ore or mixture of metals.

The use of the term assaying is sometimes restricted to alloys or mixtures of gold and silver; but in the present article we shall point out the methods of assaying the ores of the following metals also—copper, iron, lead, tin, and zinc.

The assaying of silver and gold is effected by a process called *cupellation*. Cupels are small flat crucibles made by pressing bone ash, moistened with water, into circular steel moulds, and they are dried by exposure to the air. The principle upon which the operation depends is, that all metals with which gold and silver are usually alloyed, are convertible into oxides by exposure to atmospheric air at a high temperature, whereas the precious metals remain unacted upon.

To assay silver by cupellation, it is requisite to obtain lead as free as possible from silver; when it is procured by reducing litharge, it contains only about half a grain of silver in a pound; and this portion may be neglected. The silver to be assayed is flattened and made quite clean; about thirty-six grains are to be weighed and wrapped up in the proper quantity of lead, which depends upon that of the base metal in the alloy; this, if coarse, is harder than standard silver, of a brilliant glassy appearance, and is flattened with difficulty on the anvil; if soft, easily flattened, and of a dead-white colour, a nearer approach to purity is indicated; the quantity of lead must then be apportioned according to the experience of the assayer, and varies from three to fifteen times the weight of alloy to be operated on. It is to be observed, that cupels do not absorb more than their own weight of oxide of lead, and also that if the quantity of this metal be too large, some of the silver is carried with the oxide into the cupel, and a loss of product is incurred.

The alloy and lead are to be put into a cupel when made very hot in a small earthen oven, called a *muffle*, which is placed in the assay furnace; the mixture soon fuses, is covered with a coat of oxide of lead, becomes flattened, gives off fumes, and considerable motion ensues on its surface. The lead thus gradually oxidizing and fusing is absorbed by the cupel, and carries with it the baser metals with which the silver was alloyed. The alloy is at first flat, but becomes gradually convex, and presents continually increasing shining points; when this happens, the cupel is to be brought forward to the mouth of the muffle; the shining points disappear, the silver becomes iridescent, and the operation is complete. Care must be taken to allow the assay to cool very gradually, and its weight will denote the quantity of

fine silver contained in the quantity of the alloy subjected to examination.

The assaying of gold is performed, to a certain extent, exactly in the same way as that of silver; and if the gold were alloyed only with copper, the process would be as simple as that of silver assaying. Usually, however, gold contains silver, and this cannot be got rid of by cupellation; the *parting* process is therefore had recourse to: this consists in dissolving the silver by dilute nitric acid, which leaves the gold perfectly pure, unless the silver is so small in quantity as to be protected by the gold from the action of the acid, which is very commonly the case. To obviate this difficulty the gold alloy, supposing it to weigh twelve grains, is to have from twenty-four to thirty-six grains of pure silver added to it, and to be cupelled with one hundred and eight grains of lead. The button obtained is to be flattened into a plate of about one inch and a half long, and four or five lines broad, returned to the furnace, kept for some time at a red heat, taken out and suffered to cool, and rolled up about the size of a quill. This is to be put in a matrass with about three times its weight of nitric acid, of sp. gr. 1.25, and heated on a sand-bath. By the action of the acid the silver is dissolved, and the *cornets*, as they are termed, of gold, are left of a dull-brown colour, and without any metallic appearance; these are repeatedly washed with distilled water, and heated in small clay crucibles to bright redness. The pieces of gold having thus acquired their usual appearance and properties, are to be weighed, the absolute loss in weight indicating the purity of the alloy subjected to trial.

Iron ores are chiefly of three kinds: the impure protocarbonate, commonly called the argillaceous iron ore; the peroxide, including the specular and hæmatite iron ores; the black, or magnetic ore, which is a compound of the protoxide and peroxide. The argillaceous iron ore is that which supplies by far the greatest proportion obtained in Britain; the hæmatite occurs in north Lancashire and many other places; the mines of Elba yield the specular ore, whilst the Swedish iron is obtained principally from the magnetic ore.

Various methods have been proposed for assaying these ores, but the principle is in all of them the same; it is that of separating the oxygen from the iron, by the greater affinity of charcoal for that element at high temperatures. The operation of the charcoal is frequently assisted by the use of a flux to combine with the earthy matter, and to convert it into such a glass as will let the melted metal easily fall through, and form, on cooling, a clean button. A flux composed of lime and bottle glass has been used, or the clay which accompanies the argillaceous iron ore is to be burnt and mixed with an equal weight of lime; 200 grains of the powdered ore may be mixed with an equal weight of this flux and forty grains of powdered charcoal; the mixture, put into a Cornish or Hessian crucible, is to be heated in a wind-furnace or a forge. It is not always easy to apportion the charcoal exactly to the oxide of iron in the ore; when it is either too large or too small, the product of iron is deficient, and this will be denoted by the imperfection of the glass.

In the supplement to the *Encyclopædia Britannica*, Mr. Mushet has given the results of using various fluxes with an iron ore that yielded forty-six per cent. of the metal; and it appears that the following mixture of the ore and substances, all of course reduced to powder, gave the largest proportion of iron: ore 200 grains, lime 100, borax 100, charcoal 40, gave 91 of metal; it is therefore evident that only one-half per cent. of iron remained in the glass.

According to M. Descotils (*Ann. de Chimie*, t. 84, p. 188), the earthy portion of the argillaceous iron ore is frequently such as to form a glass without adding any flux whatever to the charcoal. He used crucibles lined with a mixture of clay and charcoal; and thus, among many other assays, with nearly similar results, an ore which was found by analysis to contain about thirty-seven and three quarters per cent. of iron yielded thirty-six per cent. of the metal, and the glass was of excellent quality.

Copper ores, with reference to the mode of assaying them, may be divided into two classes—those that contain sulphur, and those that do not. The former class may be subdivided into such as also contain iron pyrites, arsenic, tin, lead, zinc, &c., with a considerable quantity of earthy matter; and such as are composed principally of a mixture of the sulphurets of copper and iron, with but small portions if any, of other metallic or earthy minerals.

To treat the first subdivision of the sulphureous ores (which constitute at least 99-100ths of all copper ores sold in Great Britain), a flux should be prepared by mixing the following ingredients in the under-mentioned weights:—

2 parts	.	.	Fluor spar,
1 ditto	.	.	Slaked lime,
1 ditto	.	.	Borax,
1 ditto	.	.	Red argol (impure tartar),
½ ditto	.	.	Nitre,

all finely powdered and well mixed.

The sample of ore being reduced to a coarse powder, take 400* grains of it, and calcine it in a Cornish or Hessian crucible, at a moderate red heat, for fifteen or twenty minutes, stirring it repeatedly with an iron rod flattened at the end. During this operation the ore will increase considerably in bulk, and it should never be continued after this begins to diminish. Having taken out the crucible in order to allow it to cool, fill the furnace with fuel, and put on the cover to increase the heat. When cool, mix the ore, without taking it out of the crucible, with about 400 grains of the prepared flux, and cover the surface of the mixture with common salt; introduce it into the furnace, and continue it therein, at a white heat, until the whole is well melted, which will be known by the surface of the mass assuming a smooth and quiet aspect. If the furnace is in good condition, this will generally be effected in about twenty minutes. Should the operator have reason to think that the mixture in the crucible has not melted thin, so as to allow the metallic regulus to subside through the slag, he may project upon it a mixture of a scruple each of nitre, borax, and argol; and this may be again repeated if necessary, adding, however, ten grains of flour of sulphur. When thoroughly melted, pour the contents of the crucible into a hemispherical iron mould, previously warmed and greased; allow it to become solid, and then quench it in water. Separate the button of regulus from the slag with a small hammer; it ought to be round and well defined, of a reddish-brown colour with shades of blue, or else bluish white. When of the former colour, it contains a little more sulphur than the latter. Should the button of regulus exhibit a brilliant bluish-white surface, the slag should be re-melted with two drachms of red argol, and a scruple each of slaked lime and sulphur, which will give a small button of regulus to be added to the former. It may here be remarked, that a button of regulus with a nucleus of metallic copper should always be rejected, and a fresh assay commenced, calcining the ore less. And if, when the slag and button of regulus are quenched in water, it renders the latter immediately turbid, and of a dirty orange-yellow colour, it should also be rejected: the ore in this case also having been too much calcined, or too large a quantity of nitre used. On the contrary, if the regulus does not collect in a compact well-defined button, but spreads under the slag a considerable way up the sides of the mould, and of a dull-brown aspect, the ore has not been sufficiently calcined.

The regulus must now be calcined: for which purpose reduce it to powder, and expose it in a clean crucible to a very dull red heat, constantly stirring it. As the operation proceeds, the heat must be increased and the stirring continued, until the whole of the sulphur is dissipated. Especial care must be taken, particularly at the commencement of the operation, to prevent the regulus from clotting or sticking together, which is caused by excess of heat or want of stirring, and much retards the operation. The same remark applies also to the calcination of ores.

The crucible having been removed from the furnace, and allowed to cool, add to the calcined regulus about a drachm each of borax and red argol, with a scruple of nitre, covering the whole with common salt. Melt the mixture well, and pour it into a mould as before; quench it in water, and knock off the slag (a high reserve) from the metallic button. The latter is now termed coarse copper, and requires to be refined; for which purpose return the crucible to the furnace, putting into it the button of copper, upon which, when

* The weight used by assayers of copper ores is 400 troy grains, marked 100 (technically called *cents*), which is subdivided down to one, and that again to one-eighth. Ore giving a button that weighs ten three-eighths is said to produce ten three-eighths per cent., and so on. The average of all the copper ores smelted in Great Britain is about eight and a half per cent.

† The furnace used for assaying copper ores is a simple air furnace, about seven inches square and fourteen inches deep, communicating with a chimney by a lateral flue five inches wide by two deep. The fuel is coke, broken to pieces about the size of walnuts, the small sifted out. Cornish crucibles are used, and require neither stand nor cover, being kept with the mouth just above the surface of the fuel.

melted, project about half a drachm of flux (prepared as below), and the like quantity of common salt. Shut up the furnace for about two minutes, or until the flux is well melted, and then pour out into the mould as before. Separate the flux (which reserve) from the button; and if the latter does not appear to be fine (or free from alloy), repeat the operation until it is. An unerring mark of fineness is a sinking or concavity in the centre of the upper surface of the 'assay,' or button; but so long as the upper surface is convex, it is not fine. If the button, when fine, instead of having a smooth brilliant surface, of a yellowish red colour, exhibits a roughish surface of a dark red colour, and having firmly attached to it bits of a dark red slag, the refining process has been pushed too far. The button being fine, take the slag which was reserved from melting the calcined regulus, together with the flux and slag from the refining process, and mix these with three drachms of red argol and a very little charcoal powder, and melt well in the crucible in which the refining is performed. This will give a small metallic button, which refine as before.

The flux above alluded to, which is used for refining, is prepared by burning together a mixture of three parts nitre, two parts red argol, and one part of common salt. This is best done by putting the ingredients into a large iron mortar, and stirring them with a red-hot poker until combustion ceases. The mass should be reduced to powder before it is quite cold, and preserved in a well-stopped bottle, or it will deliquesce. About half a drachm of this flux and of common salt are usually taken, and this will generally be a sufficient quantity, but as much should be used as will perfectly cover the button when it is poured into the mould, otherwise the metal will oxidize, which of course is to be avoided.

The ores of the second subdivision of sulphurets are best assayed by calcining them perfectly in the first instance, so that the first melting shall give a metallic button, instead of a regulus or sulphuret. To effect this, when the ore has been calcined until the whole of the sulphur is driven off, it should be melted with a drachm each of slacked lime and fluor spar, the same quantity of borax and red argol, with a little nitre; and then proceeded with precisely as directed for calcined regulus.

Copper ores not containing sulphur, or only in very small quantity, may be calcined for a short time (a few minutes is sufficient), and melted as directed in the last section, except that the quantity of lime and fluor may be reduced, and some scales of iron from a smith's forge added.

Lead.—The principal ore of lead is the sulphuret, commonly called galena; but the carbonate, or white lead ore, is sometimes found in considerable quantity.

To assay the former ore. Take 400 grains coarsely powdered, mix it with 100 grains of iron in filings or small pieces, 100 grains of black flux, and 50 grains of cream of tartar; put the mixture into a Cornish or Hessian crucible that will hold double the quantity, and cover it with common salt to the depth of half an inch. Expose it to a yellowish-white heat for about ten minutes, or until the matter in the crucible has ceased to boil, and is become smooth; then either pour it out into a hemispherical iron mould warm and greased, or allow it to cool in the crucible.

If the ore is much mixed with iron pyrites, or earthy matter, the quantity of iron should be reduced, and a little fluor spar and borax added to the other ingredients.

The carbonate is best assayed by melting it with half its weight of black flux and a little cream of tartar, covering the mixture as before with common salt.

Tin.—The ores of tin are principally of two kinds, the oxide and the sulphuret; the latter is, however, very rare.

To assay the oxide of tin, or black tin, as it is commonly called, it requires only simple fusion with half its weight of black flux, one-eighth borax and the like of cream of tartar, covering the mixture in the crucible to the depth of half an inch with common salt.

The sulphuret, or pyritous tin ore. Let 400 grains be reduced to powder and carefully calcined, with occasional additions of small portions of charcoal powder, constantly stirring it with an iron rod, and so managing the fire as to prevent the ore from clotting. This operation should be continued until the ore ceases to emit either sulphureous or arsenical vapours. When thoroughly calcined, file off from the stirring-rod any portion of the ore that may adhere to it, adding it, of course, to that in the crucible. Add likewise 40 grains of lime, 20 grains of fluor spar, 150

grains of black flux, with a small quantity of nitre, borax, and cream of tartar; when these are well mixed, cover with common salt, and when melted quite smooth, allow the crucible to cool, when the tin will be found at the bottom.

Zinc.—The ores of zinc are of two kinds, the carbonate, or calamine, and the sulphuret, or blende.

There is perhaps no mode of directly assaying the ores of this metal, so as to obtain their metallic contents. That generally given in books of chemistry and metallurgy, viz., distillation of the roasted ore mixed with charcoal in an earthen retort, will be found universally to fail, either entirely or partially. Even in the treatment of these ores in the large way, the quantity of metal obtained seldom exceeds one half the quantity which they contain: the loss arises partly from the escape of uncondensed metallic vapour, and partly from unreduced oxide.

The best mode of making comparative assays of the ores of zinc is as follows: if the ore is the carbonate, or calamine as it is usually termed, reduce it to pieces of the size of hazel nuts, weigh thirty-two ounces avoirdupois, and expose it under a muffle, or in a large crucible, to a moderate red heat, until the pieces are red-hot throughout. When cold, reduce the ore, which will have become very friable, to a fine powder; re-weigh it and note its weight, mix it with its own bulk and one-half more of powdered charcoal, and press it down moderately tight into a Stourbridge clay crucible, which it should not fill nearer than two inches to the top. Then take a piece of moistened and tempered clay, in which a little charcoal-powder and sand have been mixed, roll it out to one-eighth of an inch thick, and cut out of it a round cake to fit into the crucible upon the mixture of calamine and charcoal, giving it a little concavity on its upper surface. Then weigh as much granulated copper as is equal to two-thirds of the calcined calamine, spread it upon the disc of clay in the crucible, cover it with charcoal-powder, and lute a clay cover to the crucible. Set the crucible in an air furnace, and expose it to a bright-red heat for three hours, and then increase the heat to a yellowish-white for another hour; then take out the crucible and allow it to cool, collect the brass which will have formed on the clay disc and weigh it; if its weight equals that of the calcined calamine, the latter may be considered of good quality for commercial purposes. The arrangement may be varied by mixing the granulated copper with the calamine and charcoal, instead of putting it on the clay disc; but when the operation is finished, it will be more trouble to collect the grains of brass.

This is an operation that requires considerable nicety in the management of the fire, for if too hot, the metallic zinc is vaporised faster than the copper can combine with it; and, on the other hand, if not hot enough, the oxide will not be reduced. Attention to a few trials will give the requisite judgment.

The sulphuret, or blende, is assayed in the same way, except as to calcination.

Blende must first be reduced to a fine powder and carefully calcined upon the floor of a muffle, so heated as to exclude any carbonaceous smoke or flame, stirring it constantly with an iron rod until it ceases to give any indication of sulphur. The powdered blende should not lie above one-fourth of an inch thick on the muffle, and the heat should be very gradually raised from a dull to a bright cherry red. When perfectly calcined, it must be treated in the same way as calcined calamine.

ASSEMÂNI, JOSEPH SIMONIUS, a learned Maronite native of Syria, who came to Rome towards the beginning of the 18th century, was made Archbishop *in partibus* of Tyre, and librarian of the Vatican, by Clemens XI. He was sent by that Pontiff on a literary mission to Egypt and Syria, in the years 1715—16, and he brought back to Rome many valuable MSS. He then set about compiling his *Bibliotheca Orientalis Clementino Vaticana*, four volumes folio, Rome, 1719-28, being a biographical account of the Syrian writers, divided into three classes, i. e. Orthodox, Jacobites, and Nestorians, with copious extracts in the Syriac text, and a Latin version, lists of their works, and comments on the same. He intended to proceed with the Arabian, Copt, and other Eastern writers, but nothing appeared in print beyond the Syriac. The fourth volume of the *Bibliotheca* is engrossed by a learned dissertation on the Syrian Nestorians.—2d. *S. Ephraem Syri Opera omnia quae extant*, six volumes folio, Rome, 1732-46. This edition of the works of St. Ephraem, one of the old Syrian fathers,

containing the Syriac text and a Latin translation, was begun by Ambarach, another learned Maronite living at Rome, and better known as Father Benedetti, being a member of the society of the Jesuits, and after his death was completed by Assemani. This work is much esteemed, and the Latin is better than that of the other works of Assemani, who was more skilled in the Oriental than in the Latin language.—3d. *Kalendaria Ecclesiæ universæ, in quibus Sanctorum nomina, imagines, festi dies, Ecclesiarum Orientis ac Occidentis, præmissis unius cujusque Ecclesiæ originibus, recensentur, describuntur, et notis illustrantur*, six volumes quarto, Rome, 1755-7.—4th. *Bibliotheca Juris Orientalis Canonici et Civilis*, four volumes quarto, Rome, 1762-4.

Assemani died at Rome in 1768, at the age of eighty. He left MSS., several historical dissertations, and other fragments, on the Christian population of the antient patriarchate of Antioch, on the nation of the Copts, on the Nestorians, and other Eastern sects, &c., which have been lately published by Monsignor Maï. In his lifetime he published a dissertation on the origin and religion of the ante-Mohammedan Arabs, which he appended to his translation of Benrahebo's Chronicle. Of Assemani's friend Ambarach, we may here mention, that he translated from the Arabic into Latin the work of Stephen, Patriarch of Antioch, on the Origin and the Liturgy of the Maronites. [See MARONITES.]

ASSEMANI, STEPHANUS EVODIUS, nephew of the preceding, was made Bishop of Apamea, and succeeded his uncle as librarian of the Vatican. He published the following works. 1. *Bibliotheca Mediceo-Laurentianæ et Palatinæ codicum MSS. Orientalium Catalogus*, two volumes folio, 1743, with notes by Gori.—2. *Acta Sanctorum Martyrum Orientalium et Occidentalium*, two volumes folio, Rome, 1748. To this work, which he compiled from MSS. in the Vatican, he added the Acts of St. Simon, called Stylite, in Chaldaic and Latin. He also began a general catalogue of the Vatican MSS. divided into three classes, Oriental, Greek and Latin, Italian and other modern languages, of which, however, he published only the first volume in 1756; a fire which broke out in his chambers having destroyed his papers. Maï has continued parts of this catalogue in his *Scriptorum Veterum nova collectio*, of which the eighth volume has been lately published. Another member of the same family, called Joseph Louis Assemani, published the Alexandrine Missal, with the liturgy of the various churches of Egypt, old and modern: *Missale Alexandrinum S. Marci, in quo eucharistiæ liturgiæ omnes antiquæ ac recentiores Ecclesiarum Egypti, Græcæ, Copticæ, Arabiæ, et Syriacæ exhibentur*, quarto, Rome, 1734; and also a chronology of the Patriarchs of Chaldaea. The Assemani had a rich collection of Arabic and Syriac MSS., which Clemens XIII. purchased for the Vatican Library. Monsignor Maï has lately given catalogues of them. The Syriac MSS. alone are 202 in number.

ASSEMANI, SIMONE, grand nephew of Joseph Simon, and like him born in Syria, came to Italy, and was many years professor of Oriental languages in the university of Padua. He published several works in Italian and in Latin on Arabian literature and history. 1. *Saggio sull' origine, culto, letteratura e costumi degli Arabi, avanti il pseudo profeta Maometto*, octavo, Padua, 1787.—2. *Catalogo dei codici MSS. Orientali nella biblioteca Naliana*, quarto, Padua, 1787-8. To this catalogue he added extracts from some of the works registered in it, such as the lives of several philosophers and a series of the Persian, Arabian, and Turkish monarchs, and also illustrations of the Cufic coins and other antiquities existing in the museum of the same family of Nani.—3. *Globus Cælestis, Cufico-Arabicus*, quarto, Padua, 1790, being a description of the celestial globe in the Borgia museum at Velletri, with a dissertation on the astronomy of the Arabs. It was this Assemani who first exposed the imposture of the Maltese Vella, who pretended to have found, in an Arabic MS. in the convent of S. Martino at Palermo, a diplomatic code of the Sicilian Saracens. Vella made a translation of it, and published it at Palermo in 1789. (*Codice Diplomatico di Sicilia sotto il Governo degli Arabi*, 5 vols. 4to. Palermo, 1789-92.) The work was dedicated to the King of Naples. Assemani, to whom some of the proof sheets had been sent, pronounced the text to be unintelligible, except some lines which were Maltese instead of Arabic. At last Joseph Hager was sent for from Vienna to Palermo, and he having

examined the MS. found it contained a narrative of the life of Mohammed, much interpolated with Maltese words, apparently with the intention of rendering the original text unintelligible. Vella's imposture being now made clear, he was sentenced to imprisonment. (*Cesarotti Opere*, volume xviii.; *Fundgruben des Orients*, volume i.; and also *Allgemeinen Literarischen Anzeigen* for 1795.)

ASSEMBLY, GENERAL, OF SCOTLAND. [See GENERAL ASSEMBLY.]

ASSEMBLY, NATIONAL. [See NATIONAL ASSEMBLY.]

ASSEMBLY OF DIVINES. [See WESTMINSTER ASSEMBLY.]

ASSENT, ROYAL. When a bill has passed through all its stages in both houses of parliament, if it is a bill of supply, it is sent back to the charge of the officers of the House of Commons, in which it had of course originated; but if not a bill of supply, it remains in the House of Lords. The royal assent is always given in the House of Lords, the Commons, however, being also present at the bar, to which they are summoned by the Black Rod. The king may either be present in person, or may signify his assent by letters patent under the great seal, signed with his hand, and communicated to the two houses by commissioners. Power to do this is given by the 33d Henry VIII. chap. 21. The commissioners are usually three or four of the great officers of state. They take their seats, attired in a peculiar costume, on a bench placed between the woollack and the throne. When the king comes down in person, he is seated on the throne robed and crowned. The bills that have been left in the House of Lords lie on the table; the bills of supply are brought up from the Commons by the Speaker, who, in presenting them, especially at the end of a session, is accustomed to accompany the act with a short speech. In these addresses it is usual to recommend that the money which has been so liberally supplied by his majesty's faithful Commons should be judiciously and economically expended; and a considerable sensation has been sometimes made by the emphasis and solemnity with which this advice has been enforced upon the royal ear. The royal assent to each bill is announced by the clerk of parliament. Having read the title, he says, if it is a bill of supply, '*Le roi remercie ses loyal subjects, accepte leur benevolence, et ainsi le veut*;' if any other public bill, '*Le roi le veut*;' if a private bill, '*Soit fait comme il est désiré*.' What is called an act of grace, that is, an act by which the royal favour or bounty is extended to any party, must be signed by his majesty before it is laid before parliament, where it is only read once in each house, and where, although it may be rejected, it cannot be amended. To such an act there is no further expression of the royal assent, but, having read its title, the clerk of the parliament says, '*Les Prelats, Seigneurs, et Commons, en le present parlement assembles, au nom de tous vos autres subjects, remercient tres humblement votre majesté, et prient a Dieu vous donner en santé bone vie et longue*.'

When the royal assent is refused to a bill, the formal announcement is '*Le roi s'avisera*.' It is probable that in former times these words were intended to mean what they express, namely, that the king would take the matter into consideration, and merely postponed his decision for the present. There has been no instance of the rejection by the crown of any bill, certainly not of any public bill, which had passed through parliament, for many years. It is commonly stated, even in books of good authority (for instance, in so respectable a work as Chitty's edition of Blackstone), that the last instance was the rejection of the bill for memorial parliaments by William III. in 1693. Tindal, in his continuation of Rapin, says, 'The king let the bill lie on the table for some time, so that men's eyes and expectations were much fixed on the issue of it; but in conclusion he refused to pass it, so the session ended in an ill humour.' The rejecting a bill, though an unquestionable right of the crown, has been so seldom practised, that the two houses are apt to think it a hardship when there is a bill denied. But another instance occurred towards the close of the same year, which was more remarkable, in consequence of its being followed by certain proceedings in parliament, which was sitting at the time. This was the rejection of the bill commonly called the Place Bill, the object of which was to exclude all holders of offices of trust and profit under the crown from the House of Commons. It was presented to the king along with the land-tax bill; and the day after he

had assented to the one and rejected the other, the House of Commons, having resolved itself into a grand committee on the state of the nation, passed the following resolution:—

That whoever advised the king not to give the royal assent to the act which was to redress a grievance, and take off a scandal upon the proceedings of the Commons in parliament, is an enemy to their majesties and the kingdom; and that a representation be made to the king, to lay before him how few instances have been in former reigns of denying the royal assent to bills for redress of grievances; and the grief of the Commons for his not having given the royal assent to several public bills, and in particular to this bill, which tends so much to the clearing the reputation of this house, after their having so freely voted to supply the public occasions.' An address conformable to the resolution was accordingly presented to his majesty by the whole house. The king returned a polite answer to so much of the address as referred to the confidence that ought to be preserved between himself and the parliament, but took no notice of what was said about the rejection of the bill. When the Commons returned from the royal presence, it was moved in the house 'That application be made to his majesty for a further answer;' but the motion was negatived by a majority of 229 to 28.

Mr. Hatsell, in the second volume of his *Precedents* (edition of 1818), quotes other instances of subsequent date to this. The latest which he discovered was the rejection of a Scotch militia bill by Queen Anne in 1707. In former times the refusal of the royal assent was a common occurrence. Queen Elizabeth once at the end of a session, out of ninety-one bills which were presented to her, rejected forty-eight.

It is the royal assent which makes a bill an act of parliament, and gives it the force of a law. As by a legal fiction the laws passed throughout a whole session of parliament are considered as forming properly only one statute (of which what are popularly called the separate acts are only so many chapters), it is used to be a matter of doubt whether the royal assent, at whatever period of the session it might be given, did not make the act operative from the beginning of the session, when no day was particularly mentioned in the body of it as that on which it should come into effect. In order to settle this point, it was ordered by the 33d George III. chap. 13, that the clerk of parliament should for the future endorse on every bill the day on which it received the royal assent, and that from that day, if there was not in it any specification to the contrary, its operation should commence.

It appears that the several forms of words now in use are not, as has been sometimes stated, exactly the same that have been employed in this ceremony from the first institution of parliaments. For instance, it is recorded that Henry VII. gave his assent to the bill of attainder passed in the first year of his reign (1485) against the partisans of Richard III. in the more emphatic terms, *Le roy le voet, en toutz pointz*. On some occasions, of earlier date, the assent is stated to have been given in English. Thus, to a bill of attainder passed against Sir William Oldhall in 1453 (the 31st of Henry VI.), the clerk is recorded in the Rolls of Parliament to have announced his majesty's assent as follows: 'The king volle that it be hadde and doon in maner and forme as it is desired.' And in 1459, in the case of an act of attainder against the Duke of York, the Earls of Salisbury, Warwick, and others, the same king gave his assent in the following form: 'The king agreeth to this act, so that by virtue thereof he be not put from his prerogative to shew such mercy and grace as shall please his highness, according to his regalie and dignity, to any person or persons, whose names be expressed in this act, or to any other that might be hurt by the same.'

In the time of the Commonwealth, an English form was substituted for those in Norman-French, which had been previously and are now in use. On the 1st of October, 1656, the House of Commons resolved 'that when the Lord Protector shall pass a bill, the form of words to be used shall be these. *The Lord Protector doth consent*.' In 1706, also, a bill passed the House of Lords, and was read a second time in the House of Commons, for abolishing the use of the French tongue in all proceedings in parliament and courts of justice, in which it was directed, 'that instead of *Le roy le veult*, these words be used, *The king answers Be it so*; instead of *Soit fait come il est desire*, these words be substituted, *Be it as is prayed*;

where these words, *Le roi remercie ses bons sujets, accepte leur benevolence, et ainsi le veult*, have been used, it shall hereafter be, *The king thanks his good subjects, accepts their benevolence, and answers Be it so*; instead of *Le roi s'avisera*, these words, *The king will consider of it*, be used. 'Why this bill was rejected by the Commons,' says Hatsell, 'or why its provisions with respect to proceedings in parliament were not adopted in an act which afterwards passed in the year 1731, "That all proceedings in courts of justice should be in English," I never heard any reason assigned.' For further information on this subject, see Hatsell's *Precedents*, especially vol. ii. pp. 338—351 (edition of 1818).

ASSER, *WM. Rav Ashe*, properly ASHI, is erroneously written by English and French writers Asser. Ashi was the principal author of the Babylonian Talmud, so called from the place of his residence. He was born at Babylon A.D. 353. His Jewish biographers relate that he was appointed head of the college of Sora, in Babylon, at the age of fourteen; which, if this account be true, is an unparalleled instance of mental precocity. But whether or not full credit may be attached to this statement, Ashi was undoubtedly distinguished very early in life by intellectual powers and acquirements. He died A.D. 426, aged seventy-four.

Rabbi Abraham Ben Dior asserts, in his *Kabbalah*, p. 68, that since the days of Rabbi Jehuda Hannasi, or Rabbenu Hakkadosh, in no one but Ashi had been combined at once knowledge of the law, piety, humility, and magnificence. The expositions of the Mishna delivered by Ashi in his lectures to the students under his care were collected, and form the basis of the Babylonian Talmud. It was his practice to dictate to his pupils each year, in the month of February, a treatise, which he required them to study during six months, and when they returned to him in the month of August, to give him their views of its contents. He incited them to hold arguments on their several sentiments on the subject of the treatise, removed their doubts, and replied to their objections, or confirmed their opinions by the testimony of former sages. The heads of the classes explained at length to the younger students what had been stated succinctly by the master. Prizes were awarded to the most distinguished disciples. Ashi then delivered another treatise, which was in like manner studied during another six months, and in the month of February was discussed. From the matter thus collected, during a course of instruction which lasted sixty years, Ashi composed that part of the Babylonian Talmud which was immediately written by himself. It was continued by his disciples, the number of whom amounted to many thousands. (Compare the *Tsemach David*, first part, in the years 4127 and 4187; *Sepher Juchasin*, fol. 117; *Hakichoth Olam*, p. 18; Wolfii, *Bibliotheca Hebræa*, tom. i. p. 224.)

ASSER, or ASSERIUS MENEVENSIS, called ASKER by Ingulphus, and JOHN ASSER by Bale and Pits, was a learned monk of St. David's, whence (the name of that place in Latin being written Menapia or Menevia) he obtained the appellation of Menevensis. Leland (*Comment. de Script.* i. p. 155) states him to have been of British extraction, and Bale (edit. Basil, 1557, p. 125) says that his instructor in learning at St. David's was John Erigena. We have his own authority (*De Reb. Gest. Ælfr.* ed. Wise, p. 49) for his being related to an archbishop of St. David's of the name of Novis.

Asser was invited to the court of Alfred the Great, as is generally believed, in or about the year 880, but probably earlier, merely from the reputation of his learning. His own account is (p. 47), that those who were sent to fetch him introduced him to the king at Dene, in Wiltshire, and that the king not only received him graciously, but, at the first interview, pressed him to reside constantly at court. Asser modestly declined the proposal, alleging that it would be a reproach to him to leave a place where he had been nurtured and ordained to the priesthood, for the sake of obtaining preferment elsewhere. King Alfred then desired that he would apportion his time between the court and his monastery, passing six months at one, and six at the other: but Asser was unwilling to comply even with this request, till he had consulted the brethren of his convent. He therefore set out for St. David's, but falling ill at Winchester, lay sick there more than a year. He afterwards pursued his journey, and at length obtained the consent of his brother-monks to accept the offer, as they promised themselves great advantages from the King's favour, and more especially against the oppressions of Hemeid, one

of the petty princes of South Wales, who had occasionally persecuted their archbishop. They, however, requested Asser to prevail upon the king to let him reside quarterly at court and at St. David's, rather than that he should remain absent six months together.

When he came back, he found the king at a place called Leonaford, who received him with every mark of distinction, and with whom he remained at once eight months, reading with him such books as the king possessed. (*Ibid.* p. 50.) Asser states that, on the Christmas eve following, the king presented him with the monasteries of Amgrysbryr (supposed to be Amesbury, in Wiltshire), and Banuville (Banwell, in Somersetshire), together with a silk pall of great value, and as much income as a strong man was able to carry; adding, that these were small things, and that hereafter he should have greater. In a short time Asser had the church of Exeter bestowed upon him; and, at a later period, the bishopric of Sherburn, which, however, he quitted, according to the writer of his life in the *Biographia Britannica*, in 883, though he always retained the title. Thenceforward he constantly attended the court, in the manner before stipulated, and is named as a person in whom he had particular confidence, by King Alfred in his will, which must have been made some time in or before 885, since mention is there made of Esna, bishop of Hereford, who died that year. He bequeathed to Asser one hundred mancuses. (*Will of K. Alfr.* publ. at Oxf. p. 20.) Asser is also mentioned by King Alfred in the epistle prefixed to his translation of Gregory's '*Pastorale*,' addressed to Wulfsig, bishop of London; and there the king does not call him bishop of Sherburn, but minum bycepe, 'my bishop;' acknowledging the help received from him and others in that translation.

It seems to have been the near resemblance which the genius of Asser bore to that of the king which gained him so much of Alfred's confidence; and it was probably on this account that Asser drew up the Memoir of the Life of Alfred, which we still have, and which he dedicated and presented to the king in the year 893. In this work we have a very remarkable account of the manner in which the king and Asser passed their time together.

Asser says that, one day (it was on the feast of St. Martin), having cited in conversation a passage from a particular author, the king was pleased with it, and would have him write it down in the margin of a book which he carried in his bosom: but Asser finding no room to write it there, and yet being desirous to gratify his master, asked Alfred whether he should not provide a few leaves, on which to set down such remarkable things as occurred either in reading or conversation. The king was delighted with this hint, and directed Asser, without delay, to put it into execution. Pursuing this method constantly, their collection began to swell, till at length it became of the size of an ordinary psalter; and this was what the King called his '*Hand-book*,' or '*Manual*.'

Asser appears to have continued at court during the rest of the reign of Alfred, and probably several years after; but where or when he died is doubtful. The Saxon Chronicle positively fixes the time to the year 910.

The preferences and the works of Asser have both been subjects of controversy. The writer of his life in the *Biographia Britannica* asserts him to have been archbishop of St. David's (Kippis's edit. i. 410), which is much disputed. It seems clear, however, that Asser the monk, who is spoken of as a reader in the public schools at Oxford (Harpfield, *Hist. Eccles.* 161), if such a person did exist, was a different person from the bishop of Sherburn.

Bale and Pits give the titles of six works ascribed to our Asser. One is, of course, *The Life of Alfred*: the others are, 1. '*A Commentary on Boethius*;' 2. '*Annales Britannici*;' 3. '*Aurearum Sententiarum Enchiridion*;' 4. '*A Book of Homilies*;' 5. '*A Volume of Letters*.' The Commentary on Boethius probably means nothing more than his explanation of that author to King Alfred when the king made his Saxon translation. The *Annales* were published by Gale in his *Script.* xv. at Oxford in 1691, but are believed to be the work of a pseudo-Asser. The *Enchiridion* is, beyond question, Alfred's *Manual* already noticed. The existence of the two last works, the *Homilies* and *Letters*, is unsupported by any other authority. Many other works (but without specification) are said by Bale and Pits to have been translated into English by Asser.

The '*Annales Rerum Gestarum Alfrédi Magni*' were

first published by Archbishop Parker, at the end of Walingham's *History*, fol. Lond. 1574, and reprinted by Camden in his *Anglia, Normannica, &c.* fol. Francof. 1603. They were again reprinted in an elegant octavo volume at Oxford, by Francis Wise, in 1772: the best edition.

The celebrated manuscript of Asser, formerly in the Cottonian Library, marked Otho A. xii, was burnt in the fire at Westminster in 1731.

(See the '*Annales*,' published by Wise; Tanner's *Bibliotheca Britannico-Hibern.* p. 53; *Biogr. Brit.* art. Ayserius; Chalmers's *Biogr. Dict.*)

ASSESSMENT OF TAXES. [See TAXES.]

ASSESSMENT OF DAMAGES takes place on a writ of inquiry before the sheriff or his deputy, and a jury of the county where an action is laid, in cases where the defendant suffers judgment by default, instead of pleading and joining issue in the action. In such cases, the defendant having admitted a liability to some extent, the only question is as to the amount; and the jury are summoned merely to enquire into and assess the damages, and not as on trials where issue is joined to try the issue *as well as to* assess the damages (*tam ad triandum quam ad inquirendum*). Such assessment is subject to be set aside on motion before the court where the action is brought, in case the jury are improperly returned, or the sheriff has misdirected them in point of law, or the damages are excessive. [See WRIT OF INQUIRY.—DAMAGES.]

ASSETS (from the Norman French *assetz*, sufficient) is the real and personal property of a party deceased, which, either in the hands of his heir or devisee, or of his executor or administrator, is chargeable with the payment of his debts and legacies. Assets are either *personal* or *real*. The former, embracing goods, chattels, debts, &c. devolve on the executor or administrator; and the latter (including all real estate) descend to his heir-at-law, or are devised to his devisee. Assets are also distinguishable into *legal*, or such as render the executor or heir liable to a suit at common law on the part of a creditor; and *equitable*, or such as can only be rendered available by a suit in a court of equity, and are subject to distribution and marshalling among creditors and legatees, according to the peculiar equitable rules of that court.

1st. As to *personal legal assets*. These include all goods, chattels, and moveables, which belonged to the deceased *in action or possession* at the time of his death, and which actually come to the executor's or administrator's hands; and also all things which come to the executors or administrators at any time *in lieu* of them. Thus, a lease made to executors, in pursuance of a covenant to grant a lease to the testator in his life; goods delivered to executors under a contract to deliver them to a testator; damages recovered by an executor for breach of a contract made with the testator, are *personal legal assets*. So the young of sheep or cattle of the testator born after his death; the profits made by his executor in carrying on his trade; the value of mortgaged chattels, redeemed by the executor after the death, are assets of this description.

The locality of the property, in general, does not affect the question whether it is assets or not; it being a maxim that 'assets in any part of the world are assets in every part of the world.' Therefore, stock in foreign funds, or leasehold for years in Ireland, must, in case of a deficiency of assets in this country, be sold by the executor to satisfy the creditors. By the 5th Geo. II. c. 7. s. 4, houses, lands, negroes, &c. in the plantations of the West Indies, are rendered personal assets, devolving on the executor for satisfaction of debts. And the 9th Geo. IV. c. 33, has produced the same operation on all real estates of British subjects (not being Mohammedans or Gentoos), situate in India within the civil jurisdiction of the British supreme courts at Fort William (Calcutta), Fort St. George (Madras), and Bombay.

As the law protects an executor or administrator from any personal charge so long as he acts rightfully, the assets which render him chargeable to a creditor are, of course, only such as *come to his hands*, and not necessarily all those of which the deceased may die possessed. It was said by Wentworth, a considerable authority on this subject, that if the testator at his death has sheep in Cumberland, bullocks in Wales, fat oxen in Bucks, money, household stuff, and plate in London, and the executor dwells at Coventry, viz. far from all these places, the executor has such an actual possession immediately on the testator's death, that he may maintain trespass against any one

taking them away, and therefore it is doubtful whether these goods must not be considered to have actually come to his hands so as to be assets rendering him chargeable for payment of debts. But it seems now to be the better and more just rule, that if such property should be abstracted by any stranger either before it has been actually possessed by the executor or afterwards, so that it be without any fault of the executor, he will only be liable to account for the damages which he may actually recover against such stranger, notwithstanding such damages may be less than the actual value of the goods. And upon the same principle, goods stolen from the possession of the executor, without blame on his part, will not be considered assets, unless indeed he have neglected an opportunity of selling them for a good price. As to all such personal property of the testator as is merely in *action*, viz. debts and rights of suit, it only in general becomes assets when reduced into possession by the executor; but if he release any such claims, or take a bond or them to himself personally, they then become assets with which he is chargeable. As nothing but what is of pecuniary value is assets, if the deceased were entitled to the next presentation to a living, and died without presenting, he right in the hands of the executor would not be assets, because not legally saleable. It follows from the very definition of *assets*, that they do not embrace property which he testator possesses merely as a trustee, without having any personal beneficial interest therein; and upon the same principle, the executor cannot employ as general personal assets property which is in the testator's hands clothed with a specific trust or appropriation; for instance, bills or notes emitted to the testator to meet acceptances for any particular purpose; nor money received by the executor himself under a specific trust to apply it in payment of his testator's debts.

2. *Personal equitable assets* are such as can only be made available by the help of a court of equity, and which consequently cannot be given in evidence against an executor on his plea of *plene administravit* in a court of law. The distinction between the two classes is most important, and consists not merely in the mode of obtaining payment out of them by a creditor, but also in the scheme of their distribution or payment of debts. While legal assets must be applied in payment of debts, according to certain rules of priority (viz. Funeral charges, &c.—2. Debts to the crown—3. Judgments—4. Recognizances, &c.—5. Rent and specialty debts, is mortgages, bonds, &c.—6. Simple contract debts—7. Legacies).—equitable assets are distributable among all creditors equally, the only distinction recognized in courts of equity being that *debts* are to be preferred to *legacies*. Equitable assets embrace money produced by sale of the testator's real estate, whether his interest in such estate were legal or equitable, and whether it be expressly devised or be sold for payment of debts or not; and the equity of redemption of a mortgage is equitable and not legal assets. So also is any fund over which a man has a general power of appointment, which he exercises; in which case the property will be equitably subject to the claims of his creditors, in preference to those of his legatees or appointees.

3. *Real Assets* comprise all such lands, tenements, &c. as descend to the heir at law of the deceased, and which at common law rendered him chargeable with specialty debts binding the heir. They embrace many things not strictly of a real nature. Thus an annuity, though a personal thing, is, if granted to a man and his heirs for ever, real assets, which descend to the heir; and this is also the case with things accessory to real estate, such as chimney-pieces, wainscots, doors, and other fixtures; and even deer in a park, hares and rabbits in a warren, fish in a private pond or fishery, are held to participate in the nature of real estate, and to descend to the heir as real assets. By the statute 29 Car. II. c. 3, estates *pur autre vie*, limited to the grantee and his heirs, or his heirs, executors, and administrators, during the life of a third party, are declared to be real assets in the hands of the heir. Terms of years being personal chattels, are in general personal assets in the hands of the executor or administrator; but terms which are created or assigned over to attend the inheritance (according to the common mode, in the absence of a general registry, used by conveyancers of protecting the inheritance from judgments and personal charges of the owner) in general follow the nature of the inheritance.

At common law, it was strictly only the real estate descended to the heir which was liable to any of his debts,

and this only to debts by bond or specialty, in which the heir was specifically named. If, therefore, the debtor, after the Statute of Wills, 12 Henry VIII. c. 1, devised away his lands, his creditors were entirely defrauded of their debts. To remedy this evil, the 3d Will. and Mary, c. 14, s. 2, rendered such devises void as against creditors by bond or specialty in which the heir was bound, and enabled all such creditors to sue the devisee of the land jointly with the heir at law. And this act having been construed to apply to the case of creditors on *bond* only, has been wisely repealed, and the same provisions extended by the 1st William IV. c. 47, to creditors, not only on bonds, but on covenants, and all other specialties. But it is not merely all classes of *specialty* creditors that have now a remedy against the real assets of the debtor: the creditors by simple contract obtained such a remedy by the 47th Geo. III. st. 2, c. 74 (re-enacted by 1 Will. IV. c. 47); but this was confined to cases where the debtor, at the time of his death, was a *trader*; and none of the above provisions applied to copyhold estates. But now, by the comprehensive enactment of 3 and 4 William IV. c. 104, all the real estate of the debtor, whether *freehold*, *customary*, or *copyhold*, which he shall not, by his last will, have charged with payment of his debts, is rendered assets, to be administered in courts of equity for payment of his debts, as well those due on *simple contract* as on *specialty*; provided that in the administration of assets in courts of equity creditors by specialty in which the heir is bound shall be preferred to creditors by simple contract, or by specialty, in which the heirs are not bound. It is to be observed that this important enactment confines the remedy of simple contract creditors against the real estate to a court of equity, and does not enable a simple contract creditor to sue the heir or devisee at law.

We have hitherto treated of assets merely as regards the rights and claims of the creditor against the executors and administrators, and heirs and devisees of the debtor, in respect of assets personal or real come to their respective hands. It remains to notice the doctrine of the *exoneration of the real estate*, that is, the apportionment of the debtor's liabilities in a court of equity between the two funds of the deceased, the real and the personal estate, and also the *marshalling of assets*, in order to produce a full satisfaction of all creditors. Although a creditor by specialty has, where the deceased leaves both personal and real estate, his choice of remedies either against the one or the other, so that if he sue the heir at law he cannot be met by a plea that the deceased has left personal assets, yet it is a settled rule that the personal estate in the hands of the executor or administrator is the primary and natural fund for the payment of the debts of the deceased, of whatever description. If the creditor, therefore, proceeds against the real estate, descended or devised, the heir or devisee who has sustained the loss shall be allowed to stand in the place of the specialty creditor, and reimburse himself out of the personal estate in the hands of the executor; provided, of course, that such reimbursement will not prejudice any creditor of the deceased: and where the exoneration of the real estate is in favour of the *heir*, it must not disappoint the claim of any legatee, except the residuary legatee, nor the wife's claim to paraphernalia. But a devisee stands in a different situation from the heir; and if he is compelled to pay a bond debt of the devisor, it seems he is entitled to reimbursement out of the personal assets, to the disappointment of general legacies, and even (as it would appear) of specific legacies.

To entitle the heir or devisee to this exoneration out of the personal estate, the debt must be the *proper* debt of the deceased; for if it was a debt charged on the estate when the deceased purchased it, or a debt incurred for money borrowed to pay off then existing charges (whether debts or legacies), the land is then the proper fund for its discharge, and the heir or devisee must take the land *cum onere*, and cannot throw the burden on the personal funds. The rule is the same with respect to both debts and legacies, viz. that the personal estate is the primary and natural fund out of which they are to be paid, and that the real estate is only to be resorted to in aid of the personality; and even though debts and legacies are, by the will, effectually charged on the real estate, this is only taken for a declaration by the testator that the real estate shall be liable in case of a deficiency of personal assets. But though it requires more than a mere charge of the real estate to exempt the personality, still a testator is not debarred, if his intention be sufficiently expressed, from effecting such an exemption. As to the

mode of expression in a will requisite to operate this effect, the cases have been very numerous and contradictory, and evidence *dehors* the will has been, in some of them (as it is now held, improperly), resorted to. In earlier cases it was held that *express* words were requisite; but it is now settled that the personal assets will be exempted, if there appear, from the whole testamentary disposition taken together, sufficient to convince a *judicial* mind that the testator meant not merely to charge the real estate, but so to charge it as to exempt the personality.

Marshalling assets is that operation by a court of equity, by which claimants entitled to claim against both the real and personal estate of the deceased are compelled so to elect as not to defeat the claim of other claimants who have only one of these funds to resort to. It is a general rule of equity that if A. have two funds to resort to for his debt, B., having a claim on only one of those funds, may compel A. to have recourse to the other, provided it be necessary for the satisfaction of both. The doctrine and practice of marshalling assets as between creditors by *simple contract* and creditors by *specialty*, seems to be in a great degree superseded by the effect of the late statute 3 and 4 Will. IV. c. 104 (before stated), by which the former have acquired a claim against the freehold and copyhold as well as against the personal property of the deceased debtor. But the same rule of equity exists also in favour of *legatees*, and therefore if a creditor by bond, in which the heir is named, exhaust the personal estate instead of resorting to the heir, so as to leave nothing for payment of legacies, a legatee shall stand in the place of such bond creditor against the real assets *descended* to the heir. But if the real estate were devised to a stranger, it would be otherwise, for in that case it would not be equitable that a general legatee (nor as it seems a specific legatee) should obtain his legacy by throwing the specialty debts upon the *specific devises* of the land. The principle of course applies as between a legatee and a simple contract creditor, where the latter has a claim upon the real assets, which the former has not; as where the testator's estate is generally devised charged with debts but not with legacies. [See EXECUTORS, LEGACIES, WILLS AND TESTAMENTS; and see Williams's *Treatise on the Law of Executors and Administrators*; Bacon's *Abridgment* (7th ed.), tit. *Executors and Administrators, Legacies, Mortgage.*]

ASSIDIANS (חַסִּידִים) Chasidim Ἀσσιδαῖοι, 1 Maccab.

vii. 13. Chasidæer, *the pious*), from the root חָסַד, or rather from חֶסֶד, a term used to denote either a very good or a very bad action, but more frequently the former. It was a name given to the zealous defenders of the unity of the Deity and the belief of their ancestors, against the attempts of Antiochus Epiphanes and his successors to force the Jews into idolatry. The Assidians, or Chasidim, of those days, found a leader in Mattathias, who gave the signal for armed resistance against the Syrian tyrants, by killing the commander of the king's troops at the idolatrous altar in Modeim, near Joppa. Mattathias headed the Chasidim during four years against the Græcomania of those days. These four years are not included by Josephus in the hundred and twenty-six years of the Asmonean dynasty, which he commences from the time at which Judas Maccabi assumed the chief command.

Later Jews called those persons Chasidim who secluded themselves from worldly occupations and pleasures to devote their life solely to religious exercises and bodily chastisements, in the hope either of expiating their own sins or those of others, or of hastening the coming of the Messiah. These Chasidim studied the kabalâh, and endeavoured by their mortification of the flesh to abstract the spirit from the body, and thus have liberty to enter into communion with God and angels. They fasted frequently, and asserted that they had visions.

Solomon Maimon informs his readers in his *Memoirs* (Berlin, 1792), that some of the Chasidim died in consequence of their austerities, and that others became deranged; he also states that not a few rendered their spiritual profession subservient to their temporal aggrandisement.

About the middle of the eighteenth century a new sect of Chasidim arose, who invented a more comfortable method of ascetic practices. They taught that the union of man with God was effected by contemplation, and that in order to fix the mind on God it is necessary to quicken sensation by the enjoyment of permitted indulgences. They asserted that

mortification of the flesh disturbs that mental tranquillity which is necessary for the contemplation of God. These Chasidim considered that union with God subsists in common religionists only during seasons of prayer, and they taught that prayer should be performed with the greatest exertion and concentration of the mental faculties, in order to unite the praying spirit so intimately with God as to obtain power over all sublunary and celestial beings, and thus to realize all desires. The tsadik is always in communion with God.

After this sect became numerous, some of its members were considered representatives of God, and their words regarded as oracles. The influence of these representatives was based solely upon their appearance of sanctity, and not upon their mental superiority. They therefore endeavoured to bring science into disrepute.

The history of the modern Chasidim is briefly this: Israel Baalschem, i. e. בַּעַל שֵׁם הַטוֹב, *The Lord of the name, i. e.*

Θεουργός, *Theurgos*, whom Maimon erroneously calls Joel, lived A.D. 1740, in the town of Vlussy, in the circle of Czarkow, in Poland. His partizans assert that his birth was predicted to his father by the prophet Elijah, and that his mother was a hundred years old at the time of his birth, and his father still more advanced in years. While yet in his youth they relate that he overcame some evil spirits, or demons. Baalschem went afterwards to Medzibozze in Podolia, whence he propagated his doctrines, which are contained in a volume written by himself, and edited by his grandson under the title סֵפֶר הַמְדוּת. His testament has been published under the title צוֹת דִּבְשֵׁן. His birth and miracles are described by his disciple R. Bär Linez, in a volume entitled שְׁבֵתִי בִּבְעֵשֶׁת, *The Habitations of Besht*. The fifth edition was published A.D. 1815. The word בֵּשֶׁת, *Besht*, is formed from the initials of בַּעַל שֵׁם טוֹב, *the Lord of the good name, or, the Lord of the name of God.*

From the word Besht, the modern Chasidim have been called Beshtians. The orthodox rabbins opposed in vain the spread of the Chasidim, or Beshtians, by anathema and excommunications. Baalschem based his doctrines upon the cabalistic book of Zohar חֲזוֹן, recommending a contemplative, inactive life, and frequent bathing in spring water.

The Beshtians soon spread over Wallachia, Moldavia, Hungary, and Gallizia, but their principles were not admitted among the Jews in Germany, France, and Italy. This sect a long time concealed their doctrines and propagated their opinions rather by manuscript copies of their writings than by printed publications; but since 1817 they have printed and circulated more than twenty-five different volumes.

After the death of Baalschem, A.D. 1760, R. Bär of Madzicz, R. Mendel Przemislaw, and R. Melash of Lyzanz, endeavoured to govern the sect; not as combined triumvirs, but by each assuming the government of his own circle, under the title of צַדִּיק *tsadik, just or pious*. The title of

צַדִּיק was formerly applied to Baalschem by way of distinction, but after his death each of his three most distinguished disciples endeavoured by its assumption to vindicate his own prerogative of conversing with spirits. In conversation the disciples of Baalschem are satisfied with the title of *Abbe* or teacher.

At the present time every shrewd individual, well read in the Talmud and in cabalistical writers, may by hypocrisy obtain the dignity of a צַדִּיק, even if his morals are suspected. But the descendants of Besht have more facility in obtaining this dignity, because they are a kind of hereditary nobility among the Beshtians, the richest of whom feel themselves honoured by a degree of affinity with a צַדִּיק *tsadik*. Besht himself taught in his סֵפֶר הַמְדוּת that by honouring the descendants of the tsadik men might induce God to send the Messiah, and that the son of a tsadik is sanctified from his conception by the holy thoughts of his father, and may be called a son of God and נֶחֱם הַמֶּלֶךְ.

The tsadik has no certain salary, but is supported by voluntary gifts, for which he grants his advice to the chasidim in all transactions of life. In case that his advice seems to be unproductive of good, the cause is thought to be in the sinfulness of the receiver, and not in the inappropriateness of the counsel.

The doctrines of the chasidim may be classed under the following three heads—

I. אֲמוּנָה וְהִתְקַשְׁרוּת לַצַּדִּיק *faithfulness to wise*

men and attachment to the tsadik.

II. דְּבִקּוּת לַשֶּׁחִינָה *cleaving to the Shechinah.*

III. עֶזֶר, *courage.*

This courage may even become insolence and effrontery, so that the chasid may contradict the principles of truth, justice, equity, moderation, and decency, whenever these principles are in collision with the will of the tsadik and that of his sect.

In modern times the chasidim have left off the use of prayer books according to the German and Polish ritual, and have adopted the Spanish and oriental ritual, with which they have mixed many cabalistic elements.

It is the duty of the chasid to shout during prayer, to clap his hands loudly together, or to beat the wall with his hands, to jump about and to move the body as in convulsions. Whoever shouts during prayer with all his might, shakes his whole body, and claps his hands, averts the wrath of God and strengthens his own memory. The chasid must not be prevented by the ridicule of others from obeying in this respect the precepts of the tsadik.

The chasidim do not like to assemble in the common synagogues. In every place where ten chasidim reside they have a room called *kloesel* (clausa) for prayer and conversation, both sacred and profane. The chasidim bathe frequently. (See Peter Beer in Ersch and Gruber's *Encyclop.*, and *Geschichte der Lehren und Meinungen aller bestanden und noch bestehenden religiösen Secten der Juden, und der Geheimlehre oder Kabbalah*, von Peter Beer. Brünn, 1823. Second volume, p. 197—259.)

ASSIENTO TREATY, in Spanish, EL ASIENTO DE LOS NEGROS, and EL PACTO or TRATADO DEL ASIENTO, that is, the compact for the farming, or supply, of negroes. It is plain that the word *Asiento*, though occasionally signifying an assent or agreement, cannot, as is sometimes stated, have that meaning in this expression. Spain, having little or no intercourse with those parts of Africa from which slaves were obtained, used formerly to contract with some other nation having establishments on the western coast of that continent for the supply of its South American possessions with negroes. Such treaties were made first with Portugal, and afterwards with France, each of which countries, in consideration of enjoying a monopoly of the supply of negroes to the South American dominions of Spain, agreed to pay to that crown a certain sum for each negro imported. In both cases the Asiento was taken by a commercial association in France—by the Guinea Company, which thereupon took the name of the Asiento Company (Compagnie de l'Asiento). Both the Portuguese company and the French were ruined by their contract. At the peace of Utrecht, in 1713, the Asiento, which the French had held since 1702, was transferred to the English for a period of thirty years. In addition to the exclusive right of importing negroes, the new holders of the contract obtained the privilege of sending every year a ship of 500 (afterwards raised to 600) tons to Spanish America, with goods to be entered and disposed of in payment of the same duties which were exacted from Spanish subjects; the crown of Spain, however, reserving to itself one-fourth of the profits, and five per cent. on the remaining three-fourths. The contract was given by Queen Anne to the South Sea Company, which, however, is understood to have made nothing by it, although it was calculated that there was a profit of cent. per cent. upon the goods imported in the annual ship, which usually amounted in value to about 300,000*l.* So much of this sum as fell to the share of the company was either counterbalanced by the loss attendant on the supply of the 4800 negroes which they were bound to provide every year, or went chiefly into the pockets of their South American agents, many of whom in a few years made large fortunes. The war which broke out in 1739 stopped the further performance of this contract when there were still four years of it to run; and at the peace of Aix-la-Chapelle, in 1748, the claim of England to this remainder of the privilege was given up. Spain, indeed, complained, and probably with justice, that the greatest frauds had been all along committed under the provision of the treaty which allowed the contractors to send a shipload of goods every year to South America. It was alleged that the single ship was made the means of introducing into the American markets a quantity of goods amounting to several

times her own cargo. The public feeling in Spain had been so strongly excited on the subject of this abuse, that it would have been very difficult to obtain the consent of that country to a renewal of the treaty.

ASSIGNAT. One of the earliest financial measures of the constituent assembly, in the French revolution, was to appropriate to national purposes the landed property of the clergy, which, upon the proposition of Mirabeau, was by a large majority declared to be at the disposition of the state. (Thiers, *Histoire de la Révolution Française*, vol. i. p. 194, 2d ed.) Shortly afterwards, the assembly, desirous to profit by this measure, decreed the sale of lands belonging to the crown and the clergy, to the amount of 400 millions of francs, or about sixteen millions sterling (ib. p. 212). To sell at once so large a portion of the surface of France, without lowering the price of land by overloading the market to such an unexampled extent (see Thiers, vol. vii., p. 377), and moreover in a time of mistrust, insecurity, rapid political change, and almost of civil war, was an object of no very easy attainment. It was first proposed that the lands should be transferred to the municipalities, which, not being provided with ready money, might give the state a bond or security for the price, and the state would pay its creditors with these securities, which could, in process of time, be realized, as the municipalities were able successively to sell, at an advantageous price, the lands thus made over to them. The holders of the securities would thus have a claim not on the government but on the municipal bodies, which would be compellable by process of law to pay; and the creditor might moreover extinguish the debt by buying the lands when put up to sale, and by offering the security in payment. But it might happen that the holder of such securities would be unable to realize them, and might not be willing to purchase any of the lands of the state: in order, therefore, to obviate this objection to the securities in question, it was proposed that they should be transferable and be made a legal tender.

There was also another motive for the adoption of this latter expedient. In consequence of the want of confidence and stagnation of trade which prevailed in France at this time, money had become extremely scarce, and much of the current coin had been withdrawn from circulation: the king and queen had even been forced to send their plate to the mint. (Thiers, vol. i. p. 100.) Under these circumstances, it was determined to issue a paper-money, based on the security of the unsold lands belonging to the state. The notes thus issued (each of which was for 100 francs, equal to 4*l.*) were called *assignats*, as representing land which might be transferred or assigned to the holder; and all notes which came back in this manner to the government in payment for national lands were to be cancelled. They moreover bore an interest by the day, like English exchequer bills. The object of this measure was, therefore, to obtain the full value of the confiscated lands of the clergy (which in the actual state of France was impossible), and to supply the deficiency of coin in the circulation (arising from a feeling of insecurity) by a forced issue of inconvertible paper-money, which, as was predicted by M. de Talleyrand, the Bishop of Autun, would inevitably be depreciated, and cause misery and ruin to the holders of it. (Thiers, vol. i. p. 233-7, and note xviii. p. 382.) The first issue of assignats was to the amount of 400 millions, bearing interest; shortly afterwards 800 millions in addition were issued, but without the liability to pay interest (ib. p. 256). The last of these issues was made in September, 1790. But as in the beginning of the following year the legislative assembly sequestered the property of all the emigrants, a numerous and wealthy class, for the benefit of the state (Thiers, vol. ii. p. 51), it was thought that the amount of the national securities having been increased, the issues might be safely increased likewise: accordingly, in September 1792, although 2500 millions had been already issued, a fresh issue to the amount of 200 millions was ordered by the Convention. (Thiers, vol. iii. p. 151.) Towards the end of this year, the double effects of the general insecurity of property and person, and of the depreciation of assignats caused by their over-issue, was felt in the high price of corn, and the unwillingness of the farmers to supply the markets with provisions. Wholly mistaking the causes of this evil, the violent revolutionary party clamoured for an assize, or fixed maximum of prices, and severe penalties against *accapareurs*, or engrossers, in order to check the avarice and unjust gains of the rich farmers. The Convention, however, though pressed

both by factious violence and open insurrection, refused at this time to regulate prices by law. (Thiers, vol. iii. p. 311-7.) Prices, however, as was natural, still continued to rise; and although corn and other necessities of life were to be had, their value, as represented in the depreciated paper currency, had been nearly doubled: the washerwomen of Paris came to the Convention, to complain that the price of soap, which had formerly been fourteen sous, had now risen to thirty. On the other hand, the wages of labour had not risen in a corresponding degree (see Senior on *Some Effects of Government Paper*, p. 81): so that the evils arising from the depreciation of the assignats greatly aggravated the poverty and scarcity which would, under any circumstances, have been consequent on the troubles and insecurity of a revolution. The labouring classes accused the rich, the engrossers, and the aristocrats, of the evils which they were suffering, and demanded the imposition of a maximum of prices. Not only however in the Convention did the most violent democrats declare loudly against a maximum, but even in the more popular assembly of the commune, and the still more democratic club of the jacobins, was this measure condemned, frequently amidst the yells and hisses of the galleries. As the Convention refused to give way, Marat, in his newspaper, recommended the pillage of the shops as a means of lowering prices: a measure immediately adopted by the mob of Paris, who began by insisting to have goods at certain fixed prices, and ended by taking the goods without paying for them. (Thiers, vol. iv. p. 38-52.) These and other tumults were however appeased, partly by the interference of the military, and partly by the earnest remonstrances of the authorities: but the evil still went on increasing; corn diminished in quantity and increased in price; the national lands, on account of the uncertainty of their title and the instability of the government, were not sold, and thus the number of assignats was not contracted and they were continually more and more depreciated.

At length the Convention, thinking that the depreciation might be stopped by laws, made it penal to exchange coin for paper, or to agree to give a higher price if reckoned in paper than if reckoned in coin. Still the over-issue had its natural effects: in June, 1793, one franc in silver was worth three francs in paper; in August it was worth six. Prices rose still higher: all creditors, annuitants, and mortgagees were defrauded of five-sixths of their legal rights; and the wages of the labourers were equal in value only to a part of their former earnings. The Convention, unable any longer to resist, in May, 1793, passed a decree which compelled all farmers to declare the quantity of corn in their possession, to take it to the markets, and sell it there only, at a price to be fixed by each commune, according to the prices of the first four months of 1793. No one was to buy more corn than would suffice for a month's consumption, and an infraction of the law was punished by forfeiture of the property bought and a fine of 300 to 1000 francs. The truth of the declaration might be ascertained by domiciliary visits. The commune of Paris also regulated the selling of bread; no person could receive bread at a baker's shop without a certificate obtained from a revolutionary committee, and the quantity was proportioned to the number of the family. A rope was moreover fixed to the door of each baker's shop, so that as the purchasers successively came, they might lay hold of it, and be served in their just order. Many people in this way waited during the whole night: but the tumults and disturbances were so great that they could often only be appeased by force, nor were they at all diminished by a regulation, that the last comers should be served first. A similar maximum of prices was soon established for all other necessities, such as meat, wine, vegetables, wood, salt, leather, linen, woollen, and cotton goods, &c.; and any person who refused to sell them at the legal price was punished with death. Other measures were added to lower the prices of commodities. Every dealer was compelled to declare the amount of his stock; and any one who gave up trade, after having been engaged in it for a year, was imprisoned as a suspected person. A new method of regulating prices was likewise devised, by which a fixed sum was assumed for the cost of production, and certain percentages were added for the expense of carriage, and for the profit of the wholesale and retail dealers. The excessive issue of paper had likewise produced its natural consequence, over speculation, even in times so unfavourable for commercial undertakings. Numerous companies were established, of

which the shares soon rose to more than double or treble their original value. These shares being transferable, served in some measure as a paper-currency; upon which, the Convention thinking that they contributed still further to discredit the assignats, suppressed all companies whose shares were transferable or negotiable. The power of establishing such companies was reserved to the government alone.

In August, 1793, there were in circulation 3776 millions of assignats; and by a forced loan of 1000 millions and by the collection of a year's taxes, this amount was subsequently reduced to less than two-thirds: the confidence moreover inspired by the recent successes of the republic against its foreign and domestic enemies tended to increase the value of the securities on which the paper-money ultimately reposed: so that towards the end of 1793 the assignats are stated to have been at par. This effect is attributed by M. Thiers, in his *History of the French Revolution* (vol. v. p. 407), to the severe penal laws against the use of coin: nevertheless we suspect that those who made this statement were deceived by false appearances, and that, neither at this nor any other time, not even at their first issue, did the real value of assignats agree with their nominal value. (Thiers, vol. v. pp. 145-62, 196-208, 399-413.) However, this restoration of the paper-currency, whether real or apparent, was of very short duration, as the wants of the government led to a fresh issue of assignats: so that in June, 1794, the quantity in circulation was 6536 millions. By this time the law of the maximum had become even more oppressive than at first, and it was found necessary to withdraw certain commodities from its operation. Nevertheless, the commission of provisions, which had attempted to perform the part of a commissariat for the whole population of France, began to interfere in a more arbitrary manner with the voluntary dealings of buyers and sellers, and to regulate not only the quantity of bread but also the quantity of meat and wood which each person was to receive. (Thiers, vol. vi. pp. 146-51, 307-14.) Other arbitrary measures connected with the supply of the army, as compulsory requisitions of food and horses, and the levying of large bodies of men, had contributed to paralyse all industry. Thus not only had all commerce and all manufactures ceased, but even the land was in many places untilled. After the fall of Robespierre, the Thermidorian party (as it was called), which then gained the ascendancy, being guided by less violent principles, and being somewhat more enlightened on matters of political economy than their predecessors, induced the Convention to relax a little of its former policy, and succeeded in first excepting all foreign imports from the maximum, and afterwards abolishing it altogether. The transition to a natural system was however attended with great difficulty and danger, as the necessary consequence of the change was a sudden and immense rise of the avowed prices; and trade having been so long prevented from acting for itself, did not at once resume its former habits; so that Paris, in the middle of winter, was almost in danger of starvation, and wood was scarcely more abundant than bread. As at this time the power of the revolutionary government to retain possession of the lands which it had confiscated, and to give a permanently good title to purchasers, was not doubted, it is evident that a fear lest the national lands might not ultimately prove a valuable security did not now tend to discredit the assignats: their depreciation was solely owing to their over-issue, as compared with the wants of the country, and their inconvertibility with the precious metals. The government however began now to find that, although it might for some time gain by issuing inconvertible paper in payment of its own obligations, yet when the depreciated paper came to return upon it in the shape of taxes, it obtained in fact a very small portion of the sum nominally paid. Consequently they argued that, as successive issues depreciated the currency in a regular ratio (which however is very far from being the case), it would be expedient to require a larger sum to be paid for taxes according to the amount of paper in circulation. It was therefore decreed that, taking a currency of 2000 millions as the standard, a fourth should be added for every 500 millions added to the circulation. Thus, if a sum of 2000 francs was due to the government, it would become 2500 francs when the currency was 2500 millions, 3000 francs when it was 3000 millions, and so on. This rule however was only applied to the taxes and arrears of taxes due to the government, and was not extended to payments made by the government, as to public creditors

or public functionaries. Nor did it comprehend any private dealings between individuals. (Thiers, vol. vii. pp. 40-51, 132-41, 232-89, 368-85, 420-8.) Iniquitous as this regulation was, as employed solely in favour of the government, it would nevertheless have been ineffective if its operation had been more widely extended; for the assignats, instead of being depreciated only a fifth, had now fallen to the 150th part of their nominal value. The taxes being levied in part only in commodities, and being chiefly paid in paper, produced scarcely any thing to the government; which had however undertaken the task of feeding the city of Paris. Had it not in fact furnished something more solid than depreciated assignats to the fundholders and public functionaries, they must have died of starvation. Many, indeed, notwithstanding the scanty and precarious supplies furnished by the government, were threatened with the horrors of famine; and numbers of persons threw themselves every evening into the Seine, in order to save themselves from this extremity. (Storch, *Economie Polit.*, vol. iv. p. 168.)

To such a state of utter pauperism had the nation been reduced by the mismanagement of its finances and the ruin of public credit by the excessive issues of paper, that when the five directors went to the Luxembourg in October 1795, there was not a single piece of furniture in the office. The doorkeeper lent them a rickety table, a sheet of letter-paper, and an inkstand, in order to enable them to write their first message to announce to the two Councils of State that the Directory was established. There was not a single piece of coin in the treasury. The assignats necessary for the ensuing day were printed in the night, and issued in the morning wet from the press. Even before the entry of the directors into office, the sum in circulation amounted to 19,000 millions: a sum unheard of in the annals of financial profligacy. One of their first measures, however, in order to procure silver, was to issue 3000 millions in addition, which produced not much more than 100 million francs.

In this formidable state of things the next measure adopted was worthy of the violent and shortsighted administration from which it emanated. A forced loan of 600 millions was raised from the richest classes, to be paid either in coin, or in assignats at the hundredth part of their nominal value. So that if the current paper was 20,000 millions, a payment of 200 millions would be sufficient to extinguish the whole. The government however refused to sanction this principle as against itself; for in paying the public creditor, it gave the assignat the tenth part of its nominal value. The land-tax and the duties in farm were required to be paid half in kind and half in assignats; the custom-duties, half in corn and half in assignats. In the mean time, until the funds produced by this loan, which was enforced with great severity, could be at the disposition of the state, the government went on issuing assignats till they had absolutely lost all value, and had become waste paper. It therefore anticipated its resources by issuing promissory notes payable in specie, when the forced loan should be collected, and with difficulty prevailed on bankers to discount them to the amount of 60 millions. At this time the Directory gave up the task of supplying Paris with bread, and allowed the bakers' shops to be opened as before: an exception being made in favour of the indigent, and of fundholders and public functionaries whose annual incomes were not more than 5000 francs. The payment of the loan, however, went on slowly, the produce of the government bills was exhausted, and fresh funds were required. Again the resource of assignats was resorted to, and in two months the currency had been raised to 36,000 millions by the issue of 20,000 millions, which even to the government were not worth the 200th part of their nominal value.

By this time some new financial expedient became necessary. It was expected that, by payments of taxes and of the forced loan to the government, the paper in circulation would soon be reduced to 24,000 millions. It was therefore determined to make a new issue of paper, under the name of *mandats*, to the amount of 2400 millions. Of this sum 800 millions were to be employed in extinguishing 34,000 millions of assignats, which were to be taken at a thirtieth part of their legal value: 600 millions were to be allotted to the public service and the other 1200 millions retained in the public coffers. These mandates were to enable any person who was willing to pay the estimated value of any of the national lands to enter at once into possession; and therefore they furnished a somewhat better security than the assignats, as these could only be offered in payment at sales

by auction; and consequently the price of the lands rose in proportion to the depreciation of the paper. The estimate of the lands having been made in 1790 was not true in 1795, at which time they had in some cases lost a half, in others two-thirds or three-fourths of their former value. The mandat of 100 francs, however, at its first issue, was worth only fifteen francs in silver; and the new paper was soon so much discredited that it never got into general circulation, and was not able to drive out the coined money which was now almost universally employed in transactions between individuals. The only holders of mandates were speculators, who took them from the government and sold them to purchasers of national lands. By this entire discredit of the government-paper the prosperity of individuals had been in some measure restored, and trade revived a little from its long sleep. The government was destitute of all resource; its agents received nothing but worthless paper, and refused any longer to do their duties. The armies of the interior were in a state of extreme misery; while those of Germany and Italy were maintained only from the countries where they were quartered. The military hospitals were shut, the gens-d'armes were not paid or equipped, and the high roads were infested with bands of robbers, who sometimes even ventured into the towns.

In a short time the government were forced to abandon the mandates, as they had abandoned the assignats, and to declare that they should be received in payment of taxes and national lands only at their real value. Having fallen to near a seventieth of their ostensible value, they were, in the course of 1796, returned to the government in payment of taxes and for the purchase of lands; and with them ended the revolutionary system of paper-money, which probably produced more wide-spreading misery, more sudden changes from comfort to poverty, more iniquity in transactions both between individuals and the government, more loss to all persons engaged in every department of industry and trade, more discontent, disturbance, profligacy, and outrage, than the massacres in September, the war in La Vendée, the proscriptions in the provinces, and all the sanguinary violence of the Reign of Terror.

From the extinction of the mandates to the present time the legal currency of France has been exclusively metallic. (Thiers, vol. viii. pp. 85-9, 103-19, 158-62, 177, 183-91, 334-44, 423-4; Storch, *Cours d'Econ. Pol.*, vol. iv. p. 164.)

ASSIGNEE—of a bankrupt. [See BANKRUPT.]

ASSIGNEE—of an insolvent debtor's estate. [See INSOLVENT DEBTOR.]

ASSIGNEE—of bill of lading. [See BILL OF LADING.]

ASSIGNEE—of a lease is the party to whom the whole interest of the lessee is transferred by assignment, which assignment may be made without the privity or consent of the lessor, unless the lessee is expressly restrained by the lease from assigning over. The assignee becomes liable to the lessor, from the date of the assignment, for the payment of the rent and performance of the covenants in the lease; but such liability is limited to breaches of covenant during the existence of the assignee's interest, and may be got rid of by assigning over all his interest, and this even to an insolvent; for his liability, arising only from privity of estate, that is, from the actual enjoyment of the premises leased, ceases with such enjoyment; whereas the lessee remains liable to the rent and covenants during the whole term. It results also from the circumstance of the assignee's liability arising from privity of estate, that he is not liable to mere personal covenants which the lessee may have made with the lessor (as *e. g.* to build on premises not demised, or to pay a sum of money in gross), but only to such covenants as run with the land, as for instance, covenants to pay rent, to repair, to reside on the demised premises, to leave part of the land in pasture, to insure premises situate within the weekly bills of mortality, to build a new mill on the site of an old one, &c. [See, further, COVENANT.] The assignee, in order to become liable to the covenants, must take the whole estate and interest of the lessee; for if the smallest portion is reserved, he is merely an under-lessee, and not responsible to the original lessor. The interest of the assignee must also be a legal, not merely an equitable interest; and therefore if the lessee devise the premises leased to trustees in trust for A B, A B will not be chargeable as the assignee of the lessee's interest. The interest must also be an interest in lands or tenements; for if a lease is made of chattels (as for instance, of sheep or cows, which sometimes happens), and the lessee covenant for himself and his assigns to redeliver

them, the assignee is not liable to the owner on this covenant; for there is no privity between the assignee and the owner, such privity only existing where the subject of the demise is real estate. Wilnot, C. J. says, in *Bally v. Wells*, 'The covenant in this case is not collateral; but the parties, that is, the lessor and assignee, are total strangers to each other, without any line or thread to unite and tie them together, and to constitute that privity which must subsist between debtor and creditor to support an action.'—(Wilnot, 345.) The assignee may acquire his interest by operation of law as well as by an actual assignment from the lessee, and therefore a tenant by *elegit*, who has purchased a lease under an executor, is liable as assignee to the lessor in respect of his privity of estate. [As to the liability of assignees of bankrupt on the leases of the bankrupt, see *BANKRUPT*.]

ASSIGNMENT, a deed or instrument of transfer, the operative words of which are to 'assign, transfer, and set over,' and which passes both real and personal property. Estates for life and estates for years are the principal real interests which are passed by an assignment; and by the statute of Frauds and Perjuries (29 Car. II.) the assignment of such estates is required to be in writing. An assignment differs from a lease, in being a transfer of the entire interest of the lessor; whereas a lease is carved out of a greater estate, creates the relation of landlord and tenant, and reserves to the lessor a reversion after its expiration. If, however, a deed in effect passes the whole interest of the tenant, it operates as an assignment, though it be in form a lease, and though it reserve a rent. As if A having a term of twenty years in land, grants to B the whole twenty years, reserving a rent: in such case B is assignee of the whole term and interest, and not under-lessee to A; and A, for want of having any reversion, cannot distrain for the rent (a distress being only enforceable where the landlord has a reversion expectant on the determination of the tenancy). A, in such case, can only sue B for the rent as for money due upon a contract. In all under-leases, therefore, it is necessary that part (a day will suffice) of the original term should remain in the lessor.—See Sheppard's *Touchstone*, 266; *Black. Comm.* v. ii. 326; *Bac. Ab.* (7th edit.) tit. *Assignment*. [See *BILL OF SALE*.]

An *Assignment of Goods, Chattels, &c.*, is frequently made by bill of sale, as to which, see *BILL OF SALE*. As to all goods and chattels in possession, no objection ever existed to their transfer and assignment by deed or writing; but with respect to things in action (as debts, contracts, right of entry, and suit), according to an antient rule of the common law, now considerably modified, they could not be assigned over by the party to whom they were due, since the assignment gave to a third party a right of action against the debtor, and thus led to the offence of maintenance—i. e. the abetting and supporting of suits in the king's courts by others than the actual parties to them. In the courts of common law this rule exists (with some exceptions) at the present day. Thus, if the obligee in a bond assign over the bond to a third party, the assignee cannot sue on the bond at common law in his own name; but such an assignment generally contains (and ought always to do so) a power of attorney from the obligee to the assignee, to sue in the obligee's name on the bond. Courts of equity have always protected such assignments, and regarded the assignee, for valuable consideration, as the actual owner of the bond; and the courts of common law so far recognise the right of the assignee, that if the obligor, after notice of the assignment, pay the money on the bond to the obligee, the courts will not permit him to plead such payment to an action brought by the assignee in the obligee's name on the bond. In order to constitute a good equitable assignment of a bond, or chose in action, writing is not necessary. A personal trust or confidence cannot be assigned over, however able the assignee may be to execute it; and therefore all trust deeds and settlements contain express provisos for the retiring of trustees, and for fresh appointments, with the consent of the *cestui que trusts*. Neither the future whole-pay nor the future half-pay of an officer are capable of being assigned, it being considered contrary to public policy that a stipend given to a man for his public services should be transferred to another man not capable of performing them. The exceptions to the rule that choses in action are not assignable at law are many. The king might at all times become the assignee of a chose in action; and after such an assignment was entitled to have execution against the body, lands, and goods of the debtor. But this prerogative,

having been abused by the king's debtors, was restrained by stat. 7 Jac. I. c. 15, by a privy seal, in 12 James I., and by rule of court of 15 Car. I.; and the practice of actually assigning debts to the king by his debtors has long become obsolete. Bills of exchange are assignable by indorsement, in virtue of the custom of merchants [see *BILL OF EXCHANGE*]; and promissory notes, by virtue of the 3 and 4 Ann. cap. 9. Bail bonds are assignable by the sheriff to plaintiff in the suit under 4 Ann. c. 16. s. 20. [See *BAIL*.] Replevin bonds, by the 11 Geo. II. c. 19. [See *REPLEVIN*.] The petitioning creditor's bond under a fiat of bankruptcy, by 6 Geo. IV. c. 16. [See *BANKRUPT*. See, further, *BOND*, *CHOSE IN ACTION*, *INSOLVENT DEBTORS*.]

ASSINIBOIN RIVER. [See *RED RIVER*.]

ASSINIBOINS, a tribe of North American Indians, on and near the Assiniboin River.

ASSINT, or **ASSYNT**, a parish in the northern Highlands of Scotland. It is situated on the west coast of the county of Sutherland, adjoining Ross-shire, and has several islands belonging to it. It extends thirty-five miles in length, and twelve in breadth. It is extremely mountainous. Ben More, Assynt, which is the highest mountain in the county, is about 3200 feet above the level of the sea: it consists of quartz rocks. The other remarkable mountains, Soulvén and Quen'ag, which are nearer the coast, consist of the old red sandstone, which assumes the most singularly picturesque shapes, and the beds continue in a remarkably horizontal position, though separated from each other by several miles. The space at the foot of the mountains is generally moss. The surface fit for tillage is very limited: the cultivated spots seldom exceeding a few yards in extent. The occupation of the poorer inhabitants is fishing especially herring, cod, and ling, and the rearing of cattle. The greater portion of the parish, however, is divided into extensive sheep-walks, stocked with the improved Cheviot breed. Oats, bear, and potatoes form the food of the people, and are the objects of their cultivation.

This district belonged antiently to the Earls of Sutherland, but passing successively through the families of Moray, Kinnaird, Macleod, and Mackenzie, it reverted to the same family about a century back, being now the property of the Duchess Countess of Sutherland. There is no wood, properly speaking, but there are considerable districts covered with natural birch, intermixed with the oak, the hazel, the mountain-ash, and the honeysuckle.

A considerable portion of the interior is composed of primitive limestone; marbles of various qualities and colours have been worked, but as they contain small particles of quartz, they are too difficult to saw to come into use.

The parish is now intersected with about forty miles of excellent road, constructed entirely by the late Duke of Sutherland, which has altogether altered the condition of the people and their future prospects.

The coast is rocky and precipitous, with strong tides and a stormy ocean; but it possesses several safe boat harbours: Loch Inver on the south, and Kylesku on the north, are safe roadsteads for larger vessels, and are frequented in spring and autumn in the fishing season.

The parish church was inconveniently situated, so that many of the parishioners never saw it. The minister had, however, one or two preaching stations: but the deficiency of religious instruction has been more effectually supplied by the building of a new church at Store, under the direction of the Parliamentary Commissioners for building churches in the Highlands and Islands of Scotland, with the aid of the late Duke of Sutherland and his duchess, then Marquess and Marchioness of Stafford. Another new place of worship has also been erected by their aid and by subscription at Loch Inver. There are seven schools in Assynt, besides the parochial school; and the public and private scholars in the parish amount to between 500 and 600. The whole population is 3161. Gaelic is the language chiefly read and spoken. (Sir John Sinclair's *Statistical Account of Scotland*; *Parliamentary Reports*, &c.)

ASSISI, a town of the Papal state, in the province of Umbria, and in the administrative delegation of Perugia. It is built on a hill, and near though not upon the high road from Perugia to Foligno, in 43° 5' N. lat., and 12° 33' E. long. It commands a full view of the fine valley of Foligno, watered by the Topino, one of the tributaries of the Tiber. Assisi was the birth-place of St. Francis, the founder of the mendicant order which bears his name, of which it is considered as the metropolis. The *Sacro Convento* or

church and monastery in which St. Francis was buried, is a large and splendid building. Two miles from Assisi, by the side of the high road, is the noble church of La Madonna degli Angeli, raised by the architect Vignola, in the centre of which stands the rustic oratory where St. Francis first began his ascetic course of life. It is called the Portiuncula, from its having been the first portion, or property belonging to the order. [See FRANCIS, SAINT.] On the 2nd of August multitudes of pilgrims resort to this sanctuary. Assisium was a Roman municipium, and a place of considerable importance, as may be inferred from the remains of the forum, the thermæ, the aqueducts, and other ruins which are still seen. But the finest piece of antiquity it contains is the Temple of Minerva, transformed into a church dedicated to the Virgin; the portico, which has remained entire and in good preservation, is considered to be the finest specimen of the kind in Italy, after the Pantheon. It consists of six fluted Corinthian columns, with architrave, frieze, and cornice, surmounted by a pediment. The whole is made of travertine; the proportions are good, and the capitals and other ornaments are of fine workmanship. The inscription on the frieze, which was of brass characters, has been unfortunately lost. Only three sides of the antient cella remain, the posterior part having been lengthened when converted into a church. The columns, including base and capital, are thirty-five feet in height. This portico had been much neglected and injured, until 1753, when the Congregation of the Oratory having purchased it of the Capuchin friars for 2000 scudi, the Superior, Father Fisenodler, of Munich, restored the portico to its original appearance, and cleared it of some adjacent hovels. The house of the Congregation and the public schools are now annexed to the church. Antolini has given a description of the temple, with plates. Among other scattered remains of antiquity is a fine sarcophagus, with a rilievo representing Diana and Endymion; it forms now the table of one of the altars in the church of St. Ruffino. Several antient vases are used as public fountains.

Assisi is a bishop's see. Its population is about 4000. The country around abounds with olive trees, and there are mineral waters in the neighbourhood.

ASSIZE. This word has been introduced into our legal phraseology from the French *assise*, and is ultimately derived from the Latin verb *assideo*, to sit by, or, as Lord Coke translates it, to sit together. The word *assido* is also to be found in legal records and has in law-latin a different meaning from *assideo*, signifying to assess, fix, or ordain. Thus in the *postea*, or formal record of a verdict in a civil action, it is said that the jury find for the plaintiff, *et assidunt damna ad decem solidi*; 'and they assess the damages at ten shillings'; and then the judgment of the court is given for the damages 'per juratores in formâ prædictâ assessa.' It is possible that the word *assize*, in cases where it signifies an ordinance, decree, or assessment, may be derived from this word. This etymology is not, however, given by Du Cange, Spelman, or any learned writer on this subject; though it obviously leads much more distinctly to several meanings of the word *assize* than the derivation from *assideo*. With reference to English law, the word *assize* has been called by Littleton *nomen æquivocum*, on account of its application to a great variety of objects, in many of which neither the etymology of the word nor its original meaning can be readily traced. In this article it is proposed to enumerate and explain in a summary manner the various significations of the term.

1. The term *assize* also signified an ordinance or decree made either immediately by the king, or by virtue of some delegation of the royal authority. Thus the *Assizes of Jerusalem* were a code of feudal jurisprudence for the new kingdom of Jerusalem, formed in 1099 by an assembly of the Latin barons, and of the clergy and laity under Godfrey of Bouillon. (Gibbon's *Decline and Fall*, vol. xi. p. 93.) In this sense also, in antient English history, Fleta speaks of 'the laws, customs, and *assizes* of the realm' (lib. i. cap. 17); and the ordinances made by the great council of nobles and prelates assembled by Henry II. in 1164, and commonly known as the 'Constitutions of Clarendon,' are called by Hoveden '*Assisæ Henrici Regis factæ apud Clarendonum*.' In like manner the *assizes* of the forest were rules and regulations made by the courts to which the management of the royal forests belonged.

2. Analogous to these were the *assizes* or ordinances regulating the price of bread, ale, fuel, and other common

necessaries of life; called in Latin *assisæ venalium*. The earliest express notice of any regulation of this kind in England is in the reign of King John (1203), when a proclamation was made throughout the kingdom enforcing the observance of the legal *assize* of bread; but it is probable that there were more antient ordinances of the same kind. In very early times these '*assisæ venalium*' appear to have been merely royal ordinances, and their arrangement and superintendence was under the direction of the clerk of the market of the king's household. But at a subsequent period many statutes were passed regulating the *assize* of articles of common consumption; the earliest of these is the *assize* of bread and ale, '*assisa panis et cervisiæ*,' commonly called the stat. of 51 Henry III. though its precise date is somewhat doubtful. The provisions of the act with regard to ale, establishing a scale of prices varying with the price of wheat, were altered in some measure by 23 Henry VIII. c. 4, which left a discretionary power with the justices of the peace of fixing the price of ale within their jurisdiction [see ALE]; but the *assize* of bread was imposed by this act, and enforced from time to time by orders of the privy council until the reign of Queen Anne. In cities and towns corporate the power of regulating the *assize* of bread and ale was frequently given by charter to the local authorities, and the interference of the clerk of the King's household was often expressly excluded. Books of *assize* were formerly published, under authority of the privy council, by the clerk of the market of the king's household, and there is one still in existence which was printed in the reign of Henry VIII. The stat. 8 Anne, c. 19, repealed the 51 Henry III. and imposed a new *assize* of bread, making various other regulations respecting it. Several subsequent acts have been passed on the subject; but by the 55 Geo. III. c. 99, the practice was expressly abolished in London and its neighbourhood, and in other places it has fallen into disuse. There was also an *assize* of wood and coal (stat. 34 and 35 Henry VIII. c. 3); and so late as the reign of Queen Anne, we find an act (9 Anne, c. 20) enforcing former regulations for the *assize* of billet. Besides these, various other articles—wine, fish, tiles, cloths, &c., have at different times been subject to *assize*. The object of these regulations was the prevention of fraud and monopoly; and it is not surprising that in the early stages of legislation it should have appeared to be one of the first duties of government to secure to its subjects the prime necessities of life at a reasonable and uniform rate. But subsequent experience and more enlightened views have shown, that to attempt to fix by law the prices of commodities, is not only useless and mischievous, but in many cases impracticable; and that when government has established a uniform scale of weights and measures, and, so far as it can be done, an uniform measure of value, the rest may safely be left to competition, and to the mutual bargaining which takes place between the buyer and the seller.

3. The word *assize* also denoted the peculiar kind of jury by whom the writ of right was formerly tried, who were called the grand *assize*. The trial by the grand *assize* is said to have been devised by Chief Justice Glanville, in the reign of Henry II., and was a great improvement upon the trial by judicial combat, which it in a great degree superseded. Instead of being left to the senseless and barbarous determination by battle, which had previously been the only mode of deciding a writ of right, the alternative of a trial by the grand *assize* was offered to the tenant or defendant. Upon his choosing this mode of trial, a writ issued to the sheriff directing him to return four knights, by whom twelve others were to be elected, and the whole sixteen composed the jury, or grand *assize* by whom the matter of right was tried. The late act of parliament, 3 & 4 Will. IV. c. 27, has now abolished this mode of trial, the cumbrous machinery of which was entirely unfit for the habits of modern society. [See JURY.] By the law of Scotland, the jury, in criminal cases, are still technically called the *assize*.

4. The common and popular use of the term *assize*, at the present day in England, is to denote the sessions of the judges of the superior courts, holden periodically in each county for the purpose of administering civil and criminal justice. These assemblies no doubt originally derived their denomination from the business which was at first exclusively imposed upon them, namely, the trial of writs of *assize*. According to the common law, *assizes* could

only be taken (*i. e.* writs of assize could only be tried) by the judges sitting in term at Westminster, or before the justices in eyre at their septennial circuits. This course was productive of great delay to suitors, and much vexation and expense to the juries, or grand assize, who might have to travel from Cornwall or Northumberland, to appear in court at Westminster. To remedy this grievance, it was provided by Magna Charta, in 1225, that the judges should visit each county once in every year, to take assizes of novel disseisin and mort d'ancestor. From this provision the name of justices of assize was derived; and by several later acts of parliament various authorities have been given to them by that denomination. By the 13 Edward I. c. 3, (commonly called the statute of Westminster 2), it was enacted, that the justices of assize for each shire should be two sworn judges, associating to themselves one or two discreet knights of the county; and they are directed to take the assizes not more than three times in every year. By the same statute, authority is given them to determine inquisitions of trespass and other pleas pleaded in the courts of King's Bench and Common Pleas. From this important act of parliament the jurisdiction of the judges of assize to try civil causes, other than the writs of assize above mentioned, originally arose; and as, with some modifications, it forms the basis of their civil authority at the present day, it may be desirable to endeavour to explain the complex and argumentative process by which the provisions of the statute are practically effected. Besides the general authority to determine civil issues, it was provided by the statute of Westminster 2, that no inquest in a civil action should be taken by the judges of the superior courts when sitting at Westminster unless the judicial writ which summoned the jury for such inquest appointed a certain day and place for hearing the parties in the county where the cause of action arose. Thus, if a suit arose in Cornwall, the writ from the superior court must direct the sheriff of that county to return a jury at Westminster for the trial of the inquest in the next term, '*unless before*' (*nisi prius*) the term, namely on a certain day specified in the writ, the justices of assize came into Cornwall. This was sure to happen under the directions of a previous clause in the statute of Westminster 2, in the course of the vacation before the ensuing term, and the jury were then summoned before the justices of assize in Cornwall, where the trial took place, and the parties avoided all the trouble and expense of conveying their witnesses and juries to London. The jurisdiction of the judges of *nisi prius* is therefore an annexation to their office of justices of assize; and thus, from the alteration in the state of society since the above laws were made, the principal or substantial part of their jurisdiction has, by the discontinuance of writs of assize, become merely nominal, while their annexed or incidental authority has grown into an institution of immense practical importance.

For several centuries, until a few years ago, the whole of England was divided into six circuits, to each of which two judges of assize were sent twice a year. Previously to the year 1830, the Welsh counties and the county palatine of Chester were independent of the superior courts at Westminster, and their peculiar judges and assizes were appointed by the crown under the provisions of several statutes. This separation of jurisdiction being found inconvenient, the statute 1 William IV. c. 70 increased the number of judges of the superior courts, and enacted that, in future, assizes should be held for the trial and despatch of all matters criminal and civil within the county of Chester and the principality of Wales under commissions issued in the same manner as in the counties of England. Since the passing of this statute, therefore, the assizes throughout the whole of England and Wales (excepting London and Middlesex, where the administration of justice is regulated by peculiar customs and acts of parliament) have been holden twice a year in each county upon a uniform system. In addition to these ordinary assizes, a third assize for the trial of criminals has for the last ten years taken place in the counties of Hertford, Essex, Kent, Sussex, and Surrey.

The judges upon the several circuits derive their civil authority ultimately from the ancient statutes of assize and *nisi prius* in the manner before described; but they have also a commission of assize which is issued for each circuit by the crown under the great seal. This commission pursues the authority originally given by Magna Charta and the statutes of *nisi prius*, and seems to have been nearly in the same form ever since the passing of those statutes. It

is directed to two of the judges and several serjeants (the latter deriving their authority to be judges of assize from the statute 14 Edward III. c. 16, which mentions 'the king's serjeant sworn,' under which words Lord Coke says that any serjeant at law is intended (2 Inst. 422), and commands them 'to take all the assizes, juries, and certificates, before whatever justices arraigned.' Under the direct authority given by these words, the commissioners have in modern times nothing to do, the 'assizes, juries, and certificates' mentioned in the commission having only a technical reference to the writs of assize, now wholly discontinued. It is stated in most of the common text books that the judges of assize have also a commission of *nisi prius*. This is, however, a mistake, no such commission being known in our law, and the only authority of the judges to try civil causes being annexed to their office of justices of assize in the manner above described.

In certain cases, the justices of assize, as such, have by statute a criminal jurisdiction; but the most important part of their criminal authority is derived from other commissions. The first of these is a general commission of Oyer and Terminer for each circuit, which is directed to the lord chancellor, several officers of state, resident noblemen and magistrates, and the king's counsel and serjeants on their respective circuits; but the judges, king's counsel, and serjeants, are always of the quorum, so that the other commissioners cannot act without one of them. This commission gives the judges of assize express power to try treason, felony, and a great variety of offences against the law of England, committed within the several counties composing their circuit. [See OYER AND TERMINER.]

The judges of assize have also commissions of gaol delivery, which in their legal effect give them several powers, which, as justices of Oyer and Terminer only, they would not possess. They are directed to the judges, the king's counsel, and serjeants on the circuit, and the clerk of assize and associate. Every description of offence is cognizable under this commission; but the commissioners are not authorized to try any persons except such as are in actual or constructive confinement in the gaol specifically mentioned in their commission. There is a distinct commission under the great seal for the delivery of the prisoners in each particular gaol. [See GAOL DELIVERY.]

The judges on their circuits have also a commission of assize. In addition to the above authorities, the judges of the superior courts on the circuits are also fortified by the commission of the peace. The judges of the King's Bench, Common Pleas, and Exchequer, for the time being, are always inserted in the commissions of the peace periodically issued for each English county; and consequently they may exercise all the powers and functions communicated by the commissions of the particular counties which compose their respective circuits.

In practice, the judges of the courts at Westminster choose their circuits by arrangement among themselves on each separate occasion. They are then formally appointed by the king under the sign manual; and the several commissioners are afterwards made out in the Crown Office of the Court of Chancery from a fiat of the lord chancellor.

ASSOCIATION is one of the mental phenomena. It does not rank among the primary powers of the mind, like sensation, perception, and judgment, because it does not form one of the separate steps of all mental operations; nor do its functions consist, like those of memory, in re-embodiment past impressions. It acts as an agent to all these powers, though not a power itself. The office which it performs is to connect and arrange rather than to originate ideas. By its influence over the sensations, perceptions, and judgments, it regulates the succession of the thoughts. When one thought is suggested by another, or when a train of past images is summoned by something present, whether spontaneously or by an exertion of memory, the process by which this effort is made is called association. Dr. Brown has designated it 'the principle of suggestion;' a term which, if its operations were discriminative and voluntary, would be preferable to the one in present use. But suggestion implies deliberation, choice; whereas, it is the province of association to awaken perceptions, not to perceive; to link the thoughts, not to think; to lead the memory to successive images and trains of ideas, between which there is a bond of connexion, not always obvious, but when discovered, traceable to one or other of

those affinities, analogies, or contrasts by which the principle of association acts. Mr. Hume was the first writer who traced the influences of our associations to certain principles, which he denominated 'resemblance, contiguity in time or place, and cause or effect.' 'Contrast' has since been added to these, which completes the classification of those sympathies and predilections, seated in the mind and acting with all the force and certainty of established laws.

It is not pretended that there may not be large classes of our associations not referable to any of these principles, such as the names of things, the terms of art, the words by which we designate moral and intellectual qualities and operations; in short, the whole vocabulary of language, in which there is little or no connexion either in the way of resemblance, contiguity, cause, effect, or contrast with the objects or ideas represented, although none of them ever fail to summon up the images of the things for which they stand. Anomalies like this, when reducible to certain limits, establish rather than invalidate the laws to which they form an exception. Even the terms of a language, when once connected with their representative objects, offer one of the most remarkable illustrations of simple association. In the word *flower*, for instance, there is nothing to stamp upon the mind any particular image. To one who was ignorant of language it would convey no idea; but let the word be explained, let it once be associated with its representative genus of objects, and it instantly calls up the picture of some beautiful plant in blossom whenever the name is seen or pronounced. The distinction between association and memory is here plainly visible. The knowledge of the term *flower* is an act of memory; the knowledge of the object which it represents implies also an act of memory; but the connexion between the name and the object, and still more, between the name and the particular flower that blooms before the mind's eye, are the results of association.

Mr. Hume has annexed to his enunciation of the three principles above enumerated an example illustrative of each. 'That these principles,' he observes, 'serve to connect ideas will not, I believe, be much doubted. A picture naturally leads our thoughts to the original. The mention of one apartment in a building naturally introduces an inquiry or discourse concerning the others. And if we think of a wound, we can scarce forbear reflecting on the pain which follows it.' The first of these illustrations is founded upon the law of resemblance; the second, upon the law of contiguity; the third, upon the law of causation. 'But,' continues he, 'that this enumeration is complete, and that there are no other principles of association except these, may be difficult to prove to the satisfaction of the reader, or even to a man's own satisfaction.'

To whatever principles or laws we ascribe the association of ideas, it is evident enough that there is not only a bond of connexion amongst them, but a bond of order. The greatest irregularity and confusion would obviously prevail in our mental operations, without some regulating principle. That principle is association. It is to mind what the law of attraction is to matter. It draws together ideas connected by common affinities, and repels others that cannot coalesce. When we contemplate the vast number of different impressions made upon the mind in the course of every day, which have to be referred to again, what a confusion would be created, were there not some property in the ideas by which they arrange themselves according to certain invariable laws and relations, designed not only to preserve them, but to promote their restoration at a future period. This reproduction of our thoughts in so perfect a manner, in the order in which they are wanted, comprises one, and not the least remarkable, of the phenomena of association. Most of our ideas are reproduced with facility, but occasionally it is with difficulty they are recovered, owing either to indistinctness in the original impression, or to an imperfection of the associating faculty itself, which is not equally acute in every individual, nor equally active at all times in the same individual.

Sometimes trains of associations *involuntarily* convey the thoughts to subjects foreign to our wishes. They run away, as it were, with our ideas; and, regardless of the unities of time or place, awaken images and recollections which not only startle us by their abruptness, but occasion us at times no little trouble to account for their presence. This mental phenomenon admits of easy explanation. While the volitions of thought are intensely directed to a particular subject, the associations act in subordination to

that which is, for the time, 'the ruling idea of the mind,' when this mental intensity subsides, and the attention ceases to concentrate the faculties of thought, the mind relapses into that desultory state which is its ordinary mood in the absence of excitement. Hence the attention which fixes the thoughts controls the associations; the relaxation of attention which allows the thoughts to wander grants the same license to the associations. A striking illustration of this fact is to be found in what are called reveries—a state of mental ennui, in which the mind shrinks from exertion, and resigns itself to the guidance of the associations. In sleep, this emancipation from mental direction is still more complete; in consequence of which, the order and perspicuity of thought, so conspicuous while attention presides over intellectual exertion, are deranged. Strange contradictions and anomalies present themselves, announcing the suspension of that faculty whose office it is to restrain the wild and involuntary action of the associating power.

It should be added, however, that, although our associations roam at large during slumber, and although they may occasionally refuse to come and go at our bidding at other moments, yet they are capable of being controlled and regulated to a very high degree. A habit of attention is the governing power. Attention implies abstraction from desultory thoughts, and the act of mental direction to a particular subject. The influence of this habit keeps the associations under control; the want of it renders our waking thoughts little less incongruous than the dreams of sleep. It is one of the singular properties of association that it acts upon the moral as strongly as upon the intellectual part of our nature. Not to speak of its influence upon the generous and noble dispositions of the mind, the passions are perverted by an unlicensed association of ideas. Mr. Locke gives an example of this tendency, in reference to the origin of superstitious fear—a weakness less prevalent in the present than in the past generation. He alludes to the vulgar belief in ghosts as spirits of the night. 'The ideas of goblins and sprites have really no more to do with darkness than with light; yet let but a foolish maid inculcate these often on the mind of a child, and raise them there together, possibly he shall never be able to separate them again as long as he lives; but darkness shall ever afterwards bring with it those frightful ideas, and they shall be so joined that he can no more bear the one than the other.'

To avoid this and other errors to which the mind is exposed by an undisciplined use of the associating faculty, the greatest pains ought to be taken to render it not only subordinate but obedient to reason; to place it under the guard of attention, and to fill the intellectual storehouse with such ideas as shall only awaken pure and pleasing associations.

In relation to the phenomena of associations, it is worthy of remark that we are indebted to modern philosophy for the development if not for the discovery of them all. The original elucidation of the principle is ascribed to Mr. Locke, who, in one of the later editions of his 'Essay on the Human Understanding,' added a new chapter entitled 'Of the Association of Ideas,' in which the laws of this power are noticed, and some of its phenomena explained. Soon after, Dr. Hartley in his 'Observations on Man,' investigated the principle more thoroughly, and carried its application from simple ideas to the actions and affections, tracing all the intellectual and moral phenomena up to this source. Mr. Hume, in one of his 'Essays' published almost contemporaneously, showed that the three connecting principles of all ideas are the relations of resemblance, contiguity, and causation, to which some subsequent writer appended a fourth, viz. contrast. In the works of these philosophers is comprised all that is known in reference to the doctrine of association, later writers having done little more than expand or illustrate the views of their predecessors.

ASSOCIATION, AFRICAN. [See AFRICAN ASSOCIATION.]

ASSONANCE, *asonancia*, in Spanish romantic and dramatic and in several species of lyric poetry, is a peculiar correspondence in sound in the termination of verses, less complete than that of rhyme. In rhyme (called in Spanish *consonancia*) the vowel in the last accented syllable and all the subsequent consonants and vowels are required to be the same as in the co-rhyming verse; but in *assonance*, though the vowels of the last accented syllable and in all subsequent syllables are the same, the consonants may and

sought to be different. Thus, *bárbaro*, which has the accent on the antepenultima, is an assonant with *edlamo* and *plátano*. *Búscas*, which is accented on the penultima, is an assonant with *cúran* and *súya*. (So in English, *hardy*, *manly*, and *carry*, would be assonants; in German, *loben*, *hoffe*, *oder*.) *Corazón*, which is accented on the last syllable, is assonant with *amór*, *español*, *flor*, *voz*.

Assonants are not, like rhymes, exhibited in insulated pairs, but are continued through the whole poem, or, in dramatic compositions, through an entire act or day (*jornada*), without any other change than the alternation of blank verse with the assonants. Thus, the first, third, fifth, seventh lines, &c. of the act are blank verse, and the second, fourth, sixth, and eighth lines, &c. are all assonants to each other; unless indeed the blank line and the assonanted line which follows it be considered as constituting one long line, terminating with an *asonante*, as in the Arabian prototype supposed to be discovered by Sarmiento in some of the metrical parts of the Koran.

But for this constant recurrence of the same assonance through a long succession of alternate lines, the ear would probably be little struck with this faint species of rhyme, even when proceeding from the mouth of a Spaniard, in which the vowels are so fully and broadly sounded, without being contracted by the use of double consonants, which, while they add to the brilliancy of Italian versification, appear to render it less susceptible of this delicate species of embellishment, so peculiarly adapted to the use of the drama, for which rhyme is perhaps too prominent and too ostentatious an ornament.

Calderón, and the other classical dramatists of Spain, always use *asonantes*. The *asonante* of the drama is that in which the accent is on the penultima, the verse consisting of eight syllables.

In lyric poetry, rhyme is more frequently adopted; but the *endecha*, a species of elegy, and some other lyric measures, require the assonant. The following extracts from romances contain lines alternately blank and assonanted, as is always the case in romantic and in dramatic poetry. In the first of these examples the accent is on the penultima; in the second, on the last syllable:—

Salió el gallardo Aliatar
Con cien Moriscos gallardos
En defensa de Motril
Y socorro de su hermano.

A caballo salió el Moro,
Y otro día desdichado
En negras andas le vuelven
Por donde salió á caballo.

Maldeciré mi hermosura,
Y también mi mocedad,
Maldeciré el triste día
Que con vos quise casar.

The next is an example of double assonants:—

Aguárdate, dixo el pavo
Al cuervo de léjos.
Sabes lo que estoi pensando?
Que eres negro y feo.

Escucha; tambien reparo,
Le gritó mas recio,
En que eres un paxarraco
De mui mal agüero.

Yriarte

ASSOUAN. [See SYÑNE.]

ASSUMPSIT is the technical term denoting one of those specific forms of action which were provided, at a very early period of the history of English law, as the course by which redress for particular injuries must be pursued. It is so called from the past tense of the Latin word *assumo*, barbarously applied to signify 'I undertake'; and is taken from the use of this word, describing the defendant's undertaking, in the old Latin pleadings. Thus, the form would be 'that in consideration that the plaintiff had furnished goods to the defendant, the latter undertook, or rather took upon himself (*super se assumpsit*) to pay the former so much money.' The action of assumpsit is exclusively used for the recovery of damages occasioned by the breach of a simple contract; that is, a contract not under seal nor of record; and is now more generally adopted than any other form of action in such cases. It cannot, however, be sustained, unless there has

been an express promise to pay money as in the case of a promissory note), or to do any other act; or unless circumstances have occurred which in reason and justice have created a liability, and from which therefore the law will imply a contract. An example of the latter occurs in the familiar instance of the delivery of goods by a tradesman to a customer; in which case, though no express promise to that effect has been made, it is an inference of law that the customer has promised to pay for them as much as they are worth; and, accordingly, the plaintiff's declaration, or formal relation of his cause of action upon the pleadings, would state the debt generally, and also an *actual* promise to pay it. This would be called an *assumpsit* on a *quantum valebant*. If the consideration were the personal services of the plaintiff, given for the benefit of the employer the latter is supposed to promise to pay as much as the plaintiff 'reasonably deserved to have'; and then the action is called an *assumpsit* upon a *quantum meruit*. So also the character and relative situations of parties will often raise a legal liability, from which an *assumpsit* or undertaking will be implied in the absence of any express contract. Thus, an innkeeper is bound to secure the goods of his guests; in consequence of this liability, the law supposes him to promise to do so; and if the goods are lost or injured, he is liable to an action of assumpsit for the damage which the owner may have sustained. In like manner, it is the duty of surgeons and attorneys to use proper care and skill in the service of those who employ them in their respective callings, and being in legal consideration supposed to promise to do so, they are liable to be called upon in an action of assumpsit to make compensation in damages for any negligence or want of skill. Where the undertaking, whether express or implied, is founded upon an antecedent debt for an ascertained sum, the action is called *indebitatus assumpsit*. This form of action is of comparatively modern invention, being introduced for the purpose of enabling plaintiffs to evade the *wager of law*, which was allowed in actions of debt on simple contract until the late statute of 3 and 4 William IV. c. 42.

ASSUMPTION, or ASUNCION, the capital city of Paraguay, in South America. It is situated on the eastern bank of the River Paraguay, between the Confuso River on the north, and a branch of the Pilcomayo on the south, both of which streams fall into the Paraguay. The city, which stands upon a commanding spot, was built in 1535 by a colony of Spaniards under Juan de Salazar; and from the convenience of its situation speedily became a place of some consequence. It was nearly destroyed by fire in 1543, the greater part of the houses being built of wood. From this calamity it speedily recovered; and in 1547 was a place of sufficient importance to be erected into a bishopric. It contains a beautiful cathedral, besides three parish churches and four convents and monasteries. It once contained a college of jesuits. The present population is understood to be comparatively small; not more than 400 or 500 families are said to reside within the city, but a much larger number resort to it for the purpose of traffic, who live in the surrounding country, where the houses, having small farms attached to them, are very numerous. Assumption carried on a considerable trade in the export of hides, tobacco, and sugar; but its principal trade was furnished by the leaves of a species of herb called *matte*, more generally known by the name of Paraguay tea, which article used to be packed in hides and sent for sale to Buenos Ayres, and thence distributed to various parts of Chili and Peru. Great numbers of horned cattle, horses, mules, asses, sheep, and goats, are bred by the farmers, who grow wheat, maize, sugar, tobacco, cotton, mandioc, potatoes and other vegetables. Honey and wax are produced in abundance; and the rivers supply large quantities of fish.

The air in and about Assumption is generally temperate and genial; for the greater part of the year the wind blows from the south.

In the course of the convulsions and revolutions which of late years have disturbed so large a part of South America, Paraguay has become subject to a ruler who has so successfully discouraged all intercourse with foreign countries, as well as with the surrounding states, that the world has been for some time kept in utter ignorance of the state of the country, and the progress and condition of the inhabitants.

The city is in 25° 16' S. lat., and 57° 37' W. long.

(See Henderson's *History of Brazil*, and Thompson's *Alcedo*.)

ASSURANCE. Of late years it has become usual with writers on life contingencies to speak of *assurances* upon lives, instead of *insurances*, reserving the latter term for contingencies not depending on life, as against fire, losses at sea, &c. [See **INSURANCE, ANNUITIES, &c.**]

ASSYE, a small town, about twenty-eight miles north of Julna, in the province o. Bahar, in Hindustan. This place is principally known as having been the scene of a battle fought on the 23rd of Sept. 1803, between the English army, under the present Duke of Wellington, then General Wellesley, and the confederate armies of Dowlut Row Scindia and the Rajah of Nagpore. On this occasion, the troops under General Wellesley consisted of 2000 European and 2500 native soldiers, while the armies to which these were opposed amounted to 30,000 men. Notwithstanding this great disparity of numbers, the battle was forced on by the English general, who found the enemy encamped on the bank of the Kaitna river, which he crossed for the purpose of the attack. It was only by the most determined bravery on the part of the British that they could hope to succeed against such a disparity of numbers; and accordingly, although the cattle employed in bringing on the artillery were soon so far destroyed or disabled that the use of the guns was abandoned, the troops advanced with a steadiness which overawed the enemy, who gave way in all directions, leaving ninety-eight pieces of cannon and seven standards in the hands of the English, and 1200 men dead on the field. The loss on the part of the British was also very great, 428 being killed and 1138 wounded; so that more than one-third of the corps was included among the killed and wounded. (See Mill's *History of British India*.)

ASSYRIA is the name of an ancient empire in western Asia, which ceased to exist before the epoch at which the authentic history of the East is usually considered to commence. As a geographical term, the name Assyria is used in different acceptations. Greek and Roman historians commonly employ it as a general designation of the countries of Babylonia, Mesopotamia, Aturia, and Adiabene; but frequently extend its limits so as to make it comprehend even part of Asia Minor. The Greeks were accustomed to use the name Syria and Syrians in a very vague sense: Herodotus applies the term Syrians to the Cappadocians (i. 6, and i. 72), and he remarks that the Assyrians in the army of Xerxes were by the Greeks called Syrians, while the Eastern nations named them Assyrians (vii. 63). Arrian, on the other hand (who was for some time governor of Cappadocia, and cannot be supposed to have been ignorant of the name of a country so near his own province), in several passages employs the word Assyria where we should have expected he would say Syria; for instance, when he makes Cilicia border on the east upon Assyria (ii. c. 5 and 6). Herodotus does not appear to have given this indefinite sense to the word Assyria: in one passage (ii. 30), the Arabii and Assyrii are named together as bordering upon Egypt; but here Valckenæer and Schweighæuser agree that the reading is incorrect, and that *Syrians* should be substituted for *Assyrians*. (But see ii. 141.)

Ptolemæus (vi. 1) and the Roman historians confine the name Assyria to a province in the northern part of the Assyrian empire, namely, to the country east of Mesopotamia and the Tigris, which is separated on the north by the Niphates mountains from Armenia, and on the east by the chain of the Zagros from Media; Susiana and Babylonia constitute its southern frontiers. This portion of the ancient Assyrian empire, which comprehends part of the modern Kurdistan, seems to be meant by Herodotus (i. 102) when he speaks of 'those Assyrians that had in their possession the town of Ninus.' The country is divided into three parts by two rivers which rise in the Zagros mountains, and, after traversing Kurdistan, fall into the Tigris. The first is the Lycus, the Zabatus of Xenophon, and the modern Greater Zab: the Ten Thousand Greeks crossed this river in their retreat, probably near the place where it joins the Tigris, and here they found its breadth four plethra, or four hundred Greek feet. (Xen. *Anab.* ii. c. 5.) The second river, the Caprus, also named Zabas, or Anzabas, by the later Greek and Roman writers, is probably the present Lesser Zab: it is not noticed by Xenophon, though he must have passed it towards the end of his first day's march after crossing the Tigris. (See *Anab.* ii. c. 4.) The country to the

north-west of the Lycus, or Zabatus, is by the ancients called Aturia; that to the south-east of that river, as far as the Caprus, is named Adiabene; to the south of the Caprus we find the province of Apolloniatis, farther to the east Chalonitis, and Sittacene towards the confines of Susiana. Ammianus Marcellinus observes (lib. xxiii. c. 20) that the province of Adiabene derives its name from the two rivers between which it is enclosed, the Diaba and Adiaba, i. e. the present Greater and Lesser Zab. The Arabian name of Adiabene is Zawabiah, which is likewise a derivation of the word Zab. (See Assemani, *Bibliotheca Orientalis*, t. iii. ii. p. 711.)

The name Aturia, or Assyria, as is observed by Dion Cassius (lxviii. c. 28), is a mere dialectic variety of pronunciation instead of Assyria; and the province thus designated probably was the original central point from which the power as well as the name of Assyria was subsequently spread farther to the south and west. After the dissolution of the Assyrian monarchy through the revolt of the Medes, the name Assyria was again restricted to this northern province, while the southern parts were designated either Babylonia, from the name of the principal town, or Chaldæa, from the name of its inhabitants. Through the conquest of Cyrus, both parts were re-united, and formed one of the most important satrapies of the Persian empire, which we find sometimes named Babylonia and sometimes Assyria. This apparent confusion of the names Babylonia and Assyria is observable even in the later history of these regions, during the wars between the Romans and Parthians. That the province of Adiabene was once comprised under the appellation of Assyria, is distinctly asserted by Pliny (*Hist. Nat.* v. c. 12).

For a detailed account of the natural features of the Assyrian empire we must refer the reader to the articles **BABYLONIA**, **MESOPOTAMIA**, and **KURDISTAN**; in the present notice we confine ourselves to pointing out some of the more important ancient sites of the country.

The celebrated ancient capital, Ninus, founded by the king of the same name, was situated, according to Strabo (xvi. c. 1, t. iii. p. 334, ed. Tauchn.), in the plains of Aturia, on the river Tigris. The same author says that it fell into decay immediately after the dissolution of the Assyrian monarchy through the Medes yet Tacitus (*Annal.* xii. c. 13) speaks of the *urbs Ninus, vetustissima sedes Assyriæ*, as of a town still existing at his time. In the history of Alexander the Great the town is not noticed, although in his march along the banks of the Tigris, previous to the battle of Gaugamela, he must have been very near the spot where it is supposed to have stood. Its ruins are conjectured by some to be those discovered on the eastern side of the Tigris opposite Mosul; others think that the site of Ninus must be sought farther to the south, as, according to Ptolemy, its distance from the junction of the Zabatus and Tigris was only a few miles.

This town of Ninus must, according to Mannert, be distinguished from another city of the same name, and the Nineveh of Scripture, which was situated in the southern part of Mesopotamia, at no great distance from Babylon. Herodotus, in two different passages (i. 193, ii. 150), distinctly says that it stood on the Tigris; Diodorus (ii. c. 7), on the authority of Ctesias, places it on the Euphrates. A mass of ruins, commonly called the Tower of Nimrod, at a distance of about twelve English miles north-west of Bagdad, is supposed by some, but perhaps without good reason, to mark the site of this city.

The town of Babylon stood, according to Herodotus (i. 180), on both sides of the Euphrates. The account given by him, as well as by Diodorus (ii. c. 7) and Strabo (xvi. c. 1, t. iii. p. 335, ed. Tauchn.), of its extent, and of the immense size of its walls, is probably exaggerated; but even its present remains prove that it must have been a place of extraordinary magnitude. These have been found at no very great distance towards the north from Kufa, on the Euphrates: the present town of Hillah is situated in the midst of the ruins. (See Rich's *Memoirs on the Ruins of Babylon*, London, 1818.)

Seleucia was founded by Seleucus Nicator, probably soon after the battle of Ipsus. It was situated on a large canal (the Nahr Malcha, or Royal Water), which joined the Euphrates and Tigris, and, according to Pliny (vi. c. 26), at the point where the canal united with the latter stream. On the opposite (the eastern) side of the Tigris stood the town of Ctesiphon, and a little farther to the south that

of Coche or Choche. The foundation of Ctesiphon had been laid by the Macedonians; it did not, however, rise to importance till the time of the Parthian kings, who chose it for their summer residence. (Strabo, xvii. c. 1, t. iii. p. 344, 345, ed. Tauchn.) The ruins of Takht-i-Kesra, on the eastern side of the Tigris, are supposed to mark the situation.

The principal town of the province of Adiabene was Arbela, a name which has been preserved in that of the modern village of Erbil. [See ARBELA.] Curtius (v. 1) notices a copious well of naphtha at Mennis, in the neighbourhood of Arbela: the country around these places still abounds in mineral oil and asphaltum.

The province of Apolloniatis derives its name from that of its principal town, Apollonia: but of the history and precise situation of this place little is known.

History of Assyria.—In the book of Genesis (c. x. v. 10) the state of Assyria is represented as having sprung from that of Babylonia founded by Nimrod. 'The beginning of his dominion,' says the Hebrew text, 'was Babel, Erech, Accad, and Chalneh, in the country of Shinear. From this country Ashur went forth and built Nineveh and Rechoboth, and Calach, also Resen, between Nineveh and Calach; this is a great city.' The Hebrew chronicles leave us in the dark with reference to the history of Assyria till the earlier part of the eighth century before our æra. From this time downwards, the names of several kings of Assyria are mentioned. The earliest of them is Phul, the contemporary of Menahem the king of Israel (died B.C. 761), whose dominions he invaded and rendered tributary (2 Kings xv. 19). Tiglath Pileser ruled over Assyria while Pekah (d. B.C. 740) was king of Israel, and Ahaz (d. B.C. 728) king of Judæa: he assisted the latter in a war against Pekah and Resen the king of Aram (Syria), invaded their dominions, and led many of their subjects away into captivity. It appears that Tiglath Pileser was induced to take the part of Ahaz against his rival king by the present which Ahaz had made him of the gold and silver found in the temple and in his treasury (2 Kings xvi. 8, 9; xv. 29). Salmanassar, the contemporary of Hosea the king of Israel, and Hiskia (Hezekiah) the king of Judæa, put an end to the kingdom of Israel by conquering, after a siege of three years, its capital Samaria (B.C. 722), and leading away the remaining inhabitants of the country as captives into various eastern provinces of his dominions (2 Kings xvii. 5, 6; xviii. 9–11). Among the eastern countries subject to Salmanassar, besides some names not yet well ascertained, Media (Madaï) is mentioned (2 Kings xvii. 6; xviii. 11). The immediate successor of Salmanassar seems to have been Sanherib (Sennacherib), who undertook an expedition against Egypt (B.C. 714), in which he invaded Judæa and besieged Jerusalem, but failed in his attempt to take it. (2 Kings xviii. 13; xix. 36; 2 Chron. xxxii. 1–21.) After his return to Nineveh, his capital, Sanherib was killed by two of his own sons, Adrammelech and Shar-Ezer, who after the perpetration of this act fled into the country of Ararat (Armenia), while Esarhaddon, another son of Sanherib, succeeded him on the throne. A king of Assyria named Sargon is mentioned by the prophet Isaiah (xx. 1), who is conjectured by Winer (*Biblisches Real-Lexicon*, i. 119) to have reigned for a short period between Salmanassar and Sanherib.

The only one of these kings whose name has yet been found in the writings of the ancient Greek historians is Sanherib, whom Herodotus (ii. c. 141) mentions under the name Σαβαράριος, and designates as a king of the Arabii and Assyrii, who led an unsuccessful expedition against Egypt during the reign of King Sethos. Herodotus either wrote, or intended to write, a separate work on the Assyrian empire (see Herod. i. 184), and he accordingly adverts but incidentally to the history of that kingdom. Besides Sennacherib he only notices Ninus, the founder of the empire (i. 178), and the last king, Sardanapalus (ii. 150). Diodorus (*Bibl. Hist.* ii.), who chiefly follows Ctesias as his authority, Julius Africanus, Eusebius (*Chron. Armen.* p. 44, &c. ed. Mai and Zohrab, Milan 1818), and Syncellus (*Chronogr.* p. 73, 77, ed. Goar, Venet. 1729, fol.) commence the line of Assyrian kings with Belus and Ninus, and conclude it with Sardanapalus (also named Thonosconcoleros), who, according to Eusebius, was a contemporary of Lyeurgus and of Jero-boam II., the king of Israel (d. B.C. 784).

According to Diodorus, Ninus was the first Assyrian king who distinguished himself by conquest so as to be remembered in history. Assisted by Ariæus, an Arabian chief, he conquered Babylonia, made Armenia tributary, subjected

Media to his dominion, and compelled all the nations of south-western Asia, with the exception only of the Indians and the Bactrians, to acknowledge the supremacy of the Assyrians. He afterwards founded a magnificent city which he called after his own name, Ninus. A second expedition which he undertook against the Bactrians proved more successful than the first had been. He conquered the country, and married Semiramis, then the wife of Onnas, the governor of a Bactrian fort. The fabulous account which Ctesias has given of the birth, education, and early life, as well as of the subsequent exploits of Semiramis (Diodor. ii. c. 4, &c.; compare Bæhr's *Ctesias*, p. 393, &c.), is quite sufficient to remind us that this portion of the Assyrian history bears a decidedly mythological character, and ought therefore to be received with great caution. Semiramis succeeded Ninus on the throne. Diodorus, apparently on the authority of Ctesias, ascribes to her the foundation of the great city of Babylon on the Euphrates. Herodotus (i. 184) calls her a queen of Babylon who made embankments on the river to protect the adjacent country from inundations. Armenian writers make Semiramis the founder of another magnificent town near the lake of Wan, which they call after her name Shamiramakert: the ruins of this town were recently discovered by the German traveller Schulz. [See ARMENIA, p. 361.] Diodorus gives, chiefly from Ctesias, an account of the conquests and warlike achievements of Semiramis, which it is very amusing to read, but which evidently partakes in a high degree of the mythological character that pervades the earlier periods of history generally. She subdues Media, Persia, Egypt, and Ethiopia, but is defeated in an attempt to conquer India. She returns to Bactra, her residence resigns the government into the hands of her son Ninyas and dies in the sixty-second year of her age. Unlike his martial parents, Ninyas confined himself to his palace at Ninus, and indulged his fondness for the enjoyment of an inactive and luxurious life. The successors of Ninyas, during thirty generations, followed his example. Teutamus (or Teutanus, as the name is written in some copies of Syncellus), the twentieth successor of Ninyas, is reported to have been contemporary with the war of Troy, whither he sent troops under the command of Memnon the son of Tithonus. The names of the other Assyrian kings are not mentioned by any extant Greek or Roman historian; a list of them is, however, preserved in the Armenian translation of the chronological work of Eusebius (p. 44, &c. ed. Mai and Zohrab). The last of them was Sardanapalus, the thirtieth in succession after Ninus, who even surpassed his predecessors in indolence and voluptuousness. This encouraged the revolt of the Mede Arbaces, who succeeded in putting an end to the dominion of the Assyrians in western Asia.

According to the statement of Herodotus regarding the duration of the subsequent Median empire, as elucidated by Volney in his *Chronologie d'Hérodote* (p. 83, &c., Paris, 1809), the revolt of the Medes (under Arbaces) took place in the year 717 before Christ; and as the same ancient historian (Herod. i. 95) assigns to the empire of the Assyrians a duration of 520 years, it follows that he conceived their dominion to have lasted from the year 1237 till B.C. 717.

Ctesias gives to the Assyrian monarchy a duration of upwards of 1300 years, and differs moreover from Herodotus with regard to the period of its overthrow by the revolt of Arbaces; for he makes the dominion of the Medes last 282 years, and as it may be considered as almost certain that the dissolution of the Median kingdom by Cyrus took place in or about B.C. 561, it follows that its commencement, and the end of the Assyrian empire, are, by the statements of Ctesias, thrown back to the year B.C. 843. Heeren considers the statement of Ctesias as erroneous, and conjectures that the error might have arisen from his having counted some of the Median kings twice over. (*Göttinger Gelehrte Anzeigen*, 1810, No. 4.; Bæhr's *Ctesias Cnidii Reliquiæ*, p. 441.) Syncellus assigns to the Assyrian empire a duration of 1460 years, from A.M. 3216 to 4675, and states the number of its kings at forty-one. (Syncell. *Chronogr.* p. 77 and 132, ed. Goar.) According to the Armenian Chronicle of Eusebius (p. 37, &c. ed. Mai and Zohrab), the Assyrian kingdom lasted 1280 years.

With a view to reconcile the data concerning the history of Assyria which occur in the Old Testament with the accounts given of it by the ancient Greek writers, modern historians have assumed the existence of a second Assyrian dynasty

subsequent to the revolt of Arbaces and the fall of Sarda-napalus. This assumption is supported by some passages of Herodotus, in which Assyria is alluded to as a separate state even after the revolt of the Medes. It appears from his statements (see especially Herod. i. c. 95. 102. 106) that by the dissolution of the Assyrian empire, not only the Medes, but likewise the Babylonians and other nations that had formed part of it, resumed their previous separate and independent existence, and that besides the kingdom of Media there continued to be a Babylonian and an Assyrian state. Wars between the Medes and Assyrians are often alluded to. At last the state of Assyria seems to have yielded to the ascendancy of the Medes: Herodotus notices the capture of Ninus by the Medes (i. c. 185) during the reign of Nitocris in Babylon. This event probably led to the final incorporation of Assyria in the Median and subsequently in the Persian monarchy.

ASTACOLITES, in Zoology, one of the names given by ancient geologists to the fossil remains of the long-tailed or lobster-like crustaceans.

A'STACUS (Leach, Desmarest), in Zoology, a genus of long-tailed crustaceous animals, formed by Gronovius from the genus *Cancer* of Linnaeus and of ancient authors, which also comprised the short-tailed crustaceous decapods, with the exception of *Hippa*. Fabricius broke it down into the genera *Pagurus*, *Galathea*, and *Scyllarus*; leaving *Astacus* to represent a certain number of crustaceans, from which he afterwards, having the advantage of Daldorff's labours, separated the genera *Palinurus*, *Palæmon*, *Alpheus*, *Peneus*, and *Crangon*. Our countryman Leach, in adopting the genus as left in its last shape by Fabricius, separates from it the genus *Nephrops*, of which there is only one species recorded, the Norway lobster, *Nephrops Norvegicus*. Desmarest adopts the views of Leach, and the genus *Astacus* is now reduced to very few species.

Of these the most interesting, from their commercial value as food, are the common lobster, *Astacus marinus*, and the crawfish, *Astacus fluviatilis*.

The former is found in the greatest abundance on the rocky coasts of this kingdom, in clear water of no very great depth, at the time of depositing its eggs, about the middle of summer. Pennant mentions the great quantities supplied to the London markets, in his time, from the Orkneys and the eastern coasts of Scotland; and states the number annually brought in well-boats from the neighbourhood of Montrose alone at sixty or seventy thousand. But almost incredible as the consumption of this species is, Nature has provided for its security by the most profuse fecundity. Doctor Baster says that he counted 12,444 eggs under the tail of one female lobster, besides those that remained in the body unprotruded.

Lobsters are very voracious, and the fishery for them is carried on sometimes by means of traps, or 'pots,' (as they are called in some places) made of twigs, baited with garbage, lowered into the sea and marked by a buoy; sometimes by nets baited with the same materials; and, in some countries, by torch light, with the aid of a wooden instrument which acts like a forceps or a pair of tongs.

One of the best narratives of the habits of the lobster extant, is to be found in the following letter from Mr. Travis, of Scarborough, to Mr. Pennant, dated on the 25th October, 1768:—

'We have vast numbers of fine lobsters on the rocks, near our coast. The large ones are in general in their best season from the middle of October till the beginning of May. Many of the small ones, and some few of the larger sort, are good all the summer. If they be four inches and a half long, or upwards, from the tip of the head to the end of the back shell, they are called sizeable lobsters. If only four inches, they are esteemed half size; and when sold, two of them are reckoned for one of size. If they be under four inches, they are called *pawks*, and are not saleable to the carriers, though in reality they are in the summer months superior to the large ones in goodness. The pincers of one of the lobster's large claws are furnished with knobs, and those of the other claw are always serrated. With the former it keeps firm hold of the stalks of submarine plants, and with the latter it cuts and minces its food very dexterously. The knobbed, or numb claw, as the fishermen call it, is sometimes on the right and sometimes on the left, indifferently. It is more dangerous to be seized by them with the cutting claw than the other; but, in either case,

the quickest way to get disengaged from the creature is pluck off its claw. It seems peculiar to the lobster and crab, when their claws are pulled off that they will grow again, but never so large as at first.

'The female or hen lobster does not cast her shell the same year that she deposits her *ova*, or, in the common phrase, is in *berry*. When the *ova* first appear under her tail, they are very small and extremely black; but they become, in succession, almost as large as ripe elder-berries before they be deposited, and turn of a dark brown colour, especially towards the end of the time of her depositing them. They continue full and depositing the *ova* in constant succession, as long as any of that black substance can be found in their body, which, when boiled, turns of a beautiful red colour, and is called their *coral*. Hen lobsters are found in berry at all times of the year, but chiefly in winter. It is a common mistake, that a berried hen is always in perfection for the table. When her berries appear large and brownish, she will always be found exhausted, watery, and poor. Though the *ova* be cast at all times of the year, they seem only to come to life during the warm summer months of *July* and *August*. Great numbers of them may then be found, under the appearance of tadpoles, swimming about the little pools left by the tides among the rocks, and many also under their proper form, from half an inch to four inches in length.

'In casting their snells, it is hard to conceive how the lobster is able to draw the fish of their large claws out, leaving the shells entire and attached to the shell of their body; in which state they are constantly found. The fishermen say the lobster pines before casting, till the fish in its large claw is no thicker than the quill of a goose, which enables it to draw its parts through the joints and narrow passage near the trunk. The new shell is quite membranous at first, but hardens by degrees. Lobsters only grow in size while their shells are in their soft state. They are chosen for the table by their being heavy in proportion to their size, and by the hardness of their shells on their sides, which, when in perfection, will not yield to moderate pressure. Barnacles and other small shell-fish adhering to them are esteemed certain marks of superior goodness. Cock-lobsters are in general better than the hens in winter; they are distinguished by the narrowness of their tails, and by their having a strong spine upon the centre of each of the transverse processes beneath the tail which support the four middle plates of their tails. The fish of a lobster's claw is more tender, delicate, and easy of digestion, than that of the tail. Lobsters are not taken here in pots, as is usual where the water is deeper and more still than it is upon our coast. Our fishermen use a bag-net fixed to an iron hoop, about two feet in diameter, and suspended by three lines like a scale. The bait is commonly fish-guts tied to the bottom and middle of the net. They can take none in the daytime, except when the water is thick and opaque: they are commonly caught in the night; but even then it is not possible to take any when the sea has that luminous appearance which is supposed to proceed from the *Nereis noctiluca*. In summer, the lobsters are found near the shore, and thence to about six fathoms depth of water; in winter, they are seldom taken in less than twelve or fifteen fathoms. Like other insects,* they are much more active and alert in warm weather than in cold. In the water they can run nimbly upon their legs or small claws, and, if alarmed, can spring tail foremost, to a surprising distance, as swift as a bird can fly. The fishermen can see them pass about thirty feet, and by the swiftness of their motion, suppose they may go much farther. *Athenæus* remarks this circumstance, and says, that the incurved lobsters will spring with the activity of dolphins. Their eyes are raised upon moveable basus, which enables them to see readily every way. When frightened, they will spring from a considerable distance to their hold in the rocks; and what is not less surprising than true, will throw themselves into their hold in that manner through an entrance barely sufficient for their bodies to pass, as is frequently seen by the people who endeavour to take them at *Filey Bridge*. In frosty weather, if any happen to be found near the shore, they are quite torpid and benumbed. A sizeable lobster is commonly from one pound to two in weight. There was one taken here this summer which weighed above four,

* When this letter was written the crustaceans generally were classed with insects; but modern investigation has proved that they essentially differ in their organization from those animals.

and the fishermen say they have seen some which were of six pounds, but these are very rare.'

There is no doubt that the lobster changes its crust annually; but the mode in which this operation is performed is not satisfactorily known. Some suppose that the old crust is thrown off, and that the animal retires to some lurking place to avoid the voracity of his crust-clad fellows, till his new covering acquires sufficient hardness; others contend that the process is one of absorption, and these ask, in proof of their views of the case, what becomes of the old crusts if there is a true ecdysis or moult, for that the sea-coast at the moulting period would be strewn with them? The most probable conjecture is, that the crust sloughs off piecemeal as it does in the crawfish. Lobsters, in common with most of the crustaceans, have the power of reproduction to a great extent. If a claw be torn off, it is renewed; and if it be injured, the animal will sometimes throw it off by an effort. It seems that any violent shock to the nervous system will cause this act. If a lobster be thrown into boiling water, it will generally throw off its large claws on the instant; and the same effect has been produced by plunging the animal, when in full life, into spirit. Pennant goes so far as to make them out to be very nervous subjects indeed. 'Lobsters,' says he, 'fear thunder, and are apt to cast their claws on a loud clap. I am told they will do the same on firing a great gun; and that when men-of-war meet a lobster-boat, a jocular threat is used, that if the master does not sell them good lobsters they will *salute him*.'

That the lobster was well known to the ancients appears from the quotation in Mr. Travis's letter, and from many other evidences. It will be sufficient to add that, under the name of *δρακὺς*, Aristotle, in the second chapter of the fourth book of his *History of Animals*, gives a most faithful and elaborate account of the species which is still an inhabitant of the Mediterranean.

The crawfish, *Astacus fluviatilis*, is to be found in the fresh waters of Europe and the north of Asia. It thrives best in rivers, where, in holes in the banks and under stones, it lies in wait for the small molluscos animals, little fishes, the larvæ of insects, and decomposing animal substances, which form its prey. Desmarest says that it will live for upwards of twenty years, and that it becomes large in proportion to its age; that, towards the end of spring, it casts off the pieces which form its shell, and, some days after, becomes covered with a crust as solid as the former one, but larger, sometimes by as much as one-fifth. The eggs, which are excluded about two months after impregnation, are collected under the lower part of the body or tail, as it is popularly called, after the manner of the hen-lobster. From these proceed the young crawfishes, which are very small and soft, but which bear an exact resemblance to the parent, under whose tail they are nursed for several days.

The crawfish is taken either by nets or by bundles of thorns, in which flesh in a state of decomposition is placed. It is also taken by inserting the hand into the hole which it inhabits; and, at night, it is caught by means of lighted torches. Plot, in his *History of Staffordshire*, quotes Cardan, who says, that this species is a sign of the goodness of water; for in the best water they are boiled into the reddest colour. [See CRUSTACEA.]

ASTARTE, Achtoret or Achtarothe, one of the deities of Phœnicia, of whose attributes and character we are unable to give a detailed account, from the scantiness of the information transmitted respecting her. The author of the treatise *De Deâ Syriâ*, usually ascribed to Lucian, says, that she is the same as the Greek Selene (moon); but Cicero (*Nat. Deor.* iii. 23) considers her as the fourth Venus, the wife of Adonis. Herodian (v. 15) tells us that the Africans call her Urania, which, however, is a Greek name, and the Phœnicians, Astroarche (queen of stars). By others she is thought to be the Here (Juno) of the Greeks, but we think the opinion of Cicero is most consistent with the few facts we know respecting her, and that she was nothing else than the planet Venus, whom the Phœnicians worshipped as Astarte. She is frequently mentioned in the Holy Scriptures in connexion with Baal, as seducing the Israelites from their duty. (Judges ii. 13, iii. 17; 1 Sam. vii. 4. xii. 10.) Astarte had a magnificent temple at Sidon, where she seems to have been the principal divinity. Some mythologists speak of Hierapolis in Syria as the central point of her worship, but they have confounded her with Derceto. The island of Cyprus re-

ceived her religious rites from Phœnicia, and this divinity became known there as Aphrodite. The rose and the lotus were sacred to her, and, among animals, the lion, the horse, the boar, the lobster, and the pigeon. (See Selden. *De Diis Syriis*, p. 244; Höck, *Creta*, Göttingen, 1823; Münter, *Der Tempel der Himmlischen Göttinn zu Paphos*, Kopenhag, 1824.)

ASTARTE, in Zoology, a genus of bivalves or conchifers, with two muscular impressions and a simple mantle-line. The hinge has two divaricated teeth in the right-hand valve; in the other, one distinct and one obsolete tooth, and the rudiment of a lateral tooth. The ligament is external.

The species consist of some of the *Veneres* of Montagu, one of which is a *Crassina*. (Lam.) Some of them are English shells, and they are generally found on the sandy mud of coasts at a depth which ranges from near the surface to ten fathoms.

The crag, the green-sand, and some of the old fossiliferous beds, afford many species.

ASTBURY, a parish in Cheshire, (with a population in 1831 of 14,673) in which is the town of Congleton. [See CONGLETON.]

ASTER, a genus of plants belonging to the natural order Compositæ, and comprehending a great multitude of species scattered over all parts of the world, especially North America and New Holland. Many of them are handsome herbaceous plants, others are small-leaved shrubs, and the remainder are mere weeds. They are not of sufficient importance to claim any special notice in this work; the best account of them is the *Genera et Species Asterearum*, by Nees v. Eesenbeck.

ASTERIAS (Lam.), a genus of radiated animals widely diffused over the seas. The Linnæan genus comprised every form of radiation which appears in the tribe, but the genus *Asterias* of Lamarck includes only the starfishes properly so called. These are divided into two sections, 'the scutellated starfishes,' and 'the radiated starfishes.' The former have an angular body, the lobes or rays of which are short, their length not exceeding the diameter of the disk; the latter have a body furnished with elongated rays, whose length far exceeds the diameter of the disk.

Tiedemann has given the anatomy of these animals in a most elaborate and accurate work, and shown the adaptation of their organisation to their locomotion and general habits.

Each ray is furnished with a longitudinal furrow on its lower side, and this furrow is pierced laterally with small holes, through which pass the feet or tentacula, which are membranous, cylindrical, and terminated each of them with a little disk, which performs the office of a cupping glass, somewhat in the same manner as the acetabula or suckers of the cuttle-fishes. By elongating or shortening these numerous little organs, and by fixing them by means of their terminal disks, the progressive motions of the starfish are regulated. The rest of the lower surface is furnished with small moveable spines, which also assist progression. The whole surface is also pierced by pores, through which pass tubes much smaller than the feet, serving probably to absorb the water, and to introduce it into the general cavity, for the purposes of a kind of respiration. A large stomach lies close to the mouth; and two ramified cæca, each suspended to a kind of mesentery, are given off to each ray, which is also furnished with two ovaries, by means of which the animals are supposed to reproduce their species without the aid of a second individual. A fine chord, which surrounds the mouth, and sends a branch to each arm, is considered as the development of their nervous system.

Asterias tessellata may be taken as an example of the scutellated division. It is a widely diffused species. Of the radiated division, *Asterias glacialis*, common starfish or five-finger, may be selected as an illustration. This is common in our seas, and is supposed to be very destructive to oysters. Bishop Sprat, in his history of the Royal Society, where he treats of the common oyster, has the following passage: 'There are great penalties, by the Admiralty Court, laid upon those that fish out of those grounds which the court appoints, or that destroy the *culch*, or that take any oysters that are not of size, or that do not tread under their feet or throw upon the shore, a fish which they call a *five-finger*, resembling a spur-rowel; because that fish gets into the oysters when they gape, and sucks them out.'

Some of the species are subject to the attacks of a para-

[*Asterias tessellata*.]

sific testaceous mollusc (*Stylifer*, Brod.), which burrows in their integument, and there remains in a kind of cyst. [See COMATULA. EURYALE, GORGONOPHALUS, OPHIURA.]

ASTERISM, a collection of stars, formerly used for constellation, but now appropriated to signify any small cluster, which it is either desirable to distinguish from the rest of the constellation in which it lies, or which is not a part of any particular constellation.

ASTEROIDS. The small planets have been sometimes designated by this name. [See JUNO, VESTA, CERES, PALLAS.]

ASTHMA. [See BRONCHITIS.]

ASTI, the province of, one of the six intendenze or subdivisions of the division of Alessandria, in Piedmont. It is bounded on the west and north by the province of Turin, on the south by that of Alba, on the south-east by Alessandria Proper, and on the north-east by the province of Casale. It is watered by the Tanaro and its tributaries. The ground is hilly, and well adapted for the cultivation of the vine. A sort of sparkling fine-flavoured white wine, somewhat resembling champagne, is made here, and known by the name of *vino d'Asti*; the soil is also fertile in corn and fruit-trees, especially mulberries, whose leaves serve to feed the silk-worms. The province of Asti contains, besides the capital, several small towns—such as Villanova, S. Dariano, and Montechiaro, and eighty-seven communes, with 18,000 inhabitants.

ASTI, the town of, lies on the left or northern bank of the Tanaro, on the high road from Turin to Alessandria, and nearly half way between these cities, in $44^{\circ} 57' N.$ lat., and $80^{\circ} 12' E.$ long. Asta was a town of the antient Ligurians: it was taken and devastated by the Gauls, under Bellovesus, about B.C. 400; it afterwards made alliance with Rome, and submitted to Hannibal on his invasion of Italy. In the subsequent war of Rome against the Ligurians, Asta submitted to the Romans, but retained its municipal rights. The Romans soon after founded in its neighbourhood the colony of Pollentia, not far from the confluence of the Stura and the Tanaro. Asta having been again taken and destroyed, in a new irruption of the Gauls, was rebuilt by Pompey the Great, on his return from Spain, B.C. 60, and assumed the name of Asta Pompeia. Vespaian at a later date sent many families from Rome to Asta. Asta was devastated by the Goths, under Alaric, and restored by Narses; and taken again by Alboin, who put to death many of the inhabitants. It was erected into a duchy by the Longobards. It afterwards submitted to Charlemagne, and under his indolent successors governed itself, with its consuls, as a republic, like most Italian cities, under the influence of its bishops. In 1060, the people of Asti, after many quarrels with those of Pollentia, about the limits of their respective territories, being reinforced by the citizens of Pavia, took Pollentia, killed many of its inhabitants, completely destroyed the town, leaving not a house standing, and threw the materials into the Tanaro. When the Emperor Frederic I. of Hohenstaufen came to Italy, the Marquis of Monferrat, who wished to extend his jurisdiction over Asti, but found opposition from the citizens, complained of them to the emperor, who placed the town under the ban of the empire; and having taken it, set it on

fire, when many people perished by the sword or in the flames, A.D. 1155. Asti afterwards joined the Lombard league; at this time several of its families migrated to the new town of Alessandria, and the Bishop of Asti repaired to Constance, where the peace between the emperor and the Italian towns was signed. After this, Asti attained a considerable degree of prosperity, its citizens surrounded it with walls, and (after the then fashion in North Italy) had their podestà, or chief magistrate, chosen out of another town, and their council of trust composed of nobles and plebeians. They had frequent wars with the Marquisses of Monferrat, as well as with the Marquisses of Saluzzo; the latter of whom made peace, by receiving from the city the investiture of certain lands, for which they acknowledged themselves its vassals. The people of Asti had once manufactures of cloth; but their wealth was chiefly derived from banking or money-lending, for which business they had counting-houses in France, Flanders, and other countries. In 1248 they built the town of Villanova d'Asti, which was to them a sort of colony. About this time the factions of the Guelphs and Ghibelines broke out in Asti, and distracted the citizens for many years after; sometimes one faction prevailing, and sometimes the other, and each by turns driving its antagonist out of the city. Tired of these civil struggles, the people of Asti chose for their captain one of the princes of the house of Savoy, who obtained the investiture of it from the Emperor Henry VII., in 1313; but soon after the people revolted, and gave themselves up to Robert, King of Naples. Asti afterwards fell into the hands of the Visconti of Milan; and Duke Gian Galeazzo, in 1387, gave Asti as a dowry to his daughter Valentina, on her marriage with Louis, brother of Charles VI. of France. It remained in the possession of the French till 1529, when it was given up to the Emperor Charles V., by the peace of Cambrai. Charles gave Asti to his relation Beatrix of Portugal, who married Charles III., Duke of Savoy; since which it has remained attached to the dominions of that house.

Asti is a large city, but not peopled in proportion to its size. In the quarter where the palaces of the nobility are, the streets are rather wide, but little frequented. The most remarkable palaces are those of Trinco, Rovero, Bristagni, Massetti, and Alfieri, in the last of which Vittorio Alfieri was born in 1749. The rest of the town is badly built, and there is not much appearance of trade or industry. Of the churches, the most remarkable are the cathedral S. Secondo, which is dedicated to the first bishop of Asti, and la Consolata. Asti is a bishop's see, and the residence of the intendente of the province. It has eight parish churches, a court of justice, and a royal college, with chairs of philosophy, theology, and surgery. Its population in 1825 was stated in the *Royal Sardinian Calendar* at 22,000 inhabitants.

ASTLE, THOMAS, the author of a work on the *Origin and Progress of Writing*, and of various other antiquarian publications. He was the son of Daniel Astle, who was keeper of Needword Forest, and whose ancestors were proprietors of the manor of Fauld in Staffordshire. Thomas appears to have been born at Yoxall, in that county, in 1734. At the usual age he was sent to the office of an attorney in his native town, but his taste inclining him more to the study of general antiquities than to his profession, he came up to London; where, about the year 1763, he became known to Mr. Grenville, then First Lord of the Treasury and Chancellor of the Exchequer, and was employed by him in the arrangement of papers, and other business which required a knowledge of antient hand-writing. Soon after this, Mr. Astle married the only daughter of the Reverend Philip Morant, the author of the *History of Essex*, and by this connexion he eventually inherited the property of his father-in-law, which was considerable. In 1765 he was appointed by Mr. Grenville to the office of receiver-general of sixpence in the pound on the civil list. In 1770, on the death of Mr. Morant, who had till then superintended the printing of the Antient Records of Parliament begun five years before, Astle was appointed by the House of Lords to take his place, and he presided over the publication till its completion in 1775. He was then made chief clerk in the Record Office in the Tower; and some years after he succeeded to the place of Keeper. He was, besides, a Fellow of the Royal and Antiquarian Societies, and, till his death, one of the Trustees of the British Museum. He died at his house at Battersea Rise, near Clapham, on the 1st of December, 1803. Mr. Astle is the author of a number of

articles in th *Archæologia*, and also of several separate publications, a list of which may be found in Watt's *Bibliotheca Britannica*, and in Chalmers's *Biographical Dictionary*, from the last of which authorities we have taken the facts in this notice. The work by which he is best known is his *Origin and Progress of Writing*, first published in quarto in 1784, and again in 1803, in the same form. The latter edition appears to be an exact copy of the former, except that it contains an engraved portrait of the author, and an appendix 'On the Radical Letters of the Pelasgians, and their Derivatives,' a tract of a few pages, which had been first printed in part in the seventh volume of the *Archæologia* in 1785. Watt mentions what he calls 'an improved edition' of the work on Writing, published in 4to. in 1794, which we have not seen. He afterwards calls the edition of 1803 the second edition. Besides the works enumerated by Chalmers and Watt, there is a reprint, in 4 vols. 4to., published in 1807 and following years, of Grose's *Antiquarian Repertory* (first published in 1775), on the title-page of which the name of Astle is given as one of the compilers along with that of Grose. Mr. Astle's library, which was very curious, was purchased by the Royal Institution for a thousand pounds.

ASTOLPHUS succeeded his brother Ratchis as king of the Longobards A.D. 750. Ratchis having voluntarily abdicated, and retired into the monastery of Monte Casino. Astolphus, who was bold and ambitious, aimed at driving away the Greeks from Italy; he took Ravenna, expelled the Exarch, and conquered the Pentapolis, which comprised part of the present March of Ancona. In 752 he turned his arms against the duchy of Rome, which still acknowledged the authority of the eastern empire, tempered however by the influence of the popes. Stephen II. sent ambassadors to Astolphus with splendid gifts, and obtained a truce for forty years. Four months after, however, Astolphus broke the truce, and required the Romans to swear allegiance to him, and pay a capitation tax; threatening them with fire and sword in case of non-compliance. Pope Stephen, despairing of assistance from the indolent Byzantine court, had recourse to Pepin, king of the Franks, and he himself repaired to Paris, where he crowned Pepin, and bestowed on his two sons Carlomann and Charles (afterwards Charlemagne) the title of Patricians of Rome, A.D. 753. Pepin now invited Astolphus to restore the Exarchate to the empire, and to let Rome enjoy peace, but his request failing of effect, he assembled his barons, marched an army into Italy, defeated Astolphus, and besieged him in the city of Pavia. A treaty was concluded through the pope's mediation, by which Astolphus agreed to the above conditions. Pepin then returned into France. This was the first interference of the French in the affairs of Italy.

Astolphus did not keep his word, but in 755 marched against Rome, and laid siege to it. The pope wrote to Pepin, who crossed the Alps a second time, and again besieged Astolphus in Pavia. Astolphus now sued for peace; he paid a large sum to Pepin for the expenses of the war, and gave up the Exarchate, including Comacchio, as well as the Pentapolis, which were not restored by Pepin to the empire, but bestowed by him on the see of St. Peter. Pepin sent the abbot of St. Denis, who received the keys of the various towns from Astolphus's commissioners, and deposited them on the altar of St. Peter at Rome. This was the origin of the temporal power of the popes, as independent sovereigns. A difference of opinion exists with regard to the terms of this donation, the act of which, if it ever existed in writing, has been lost. The territory thus given up, however, included the country of Ravenna and the province since called Romagna. The duchy of Rome was not included in it. Astolphus died in 756, owing to a fall from his horse. Having no son, he was succeeded by Desiderius, one of the Longobard dukes. Astolphus, during his quarrels with the pope, founded several monasteries, in one of which his daughters took the veil. (Muratori, *Annali d'Italia*; Mosheim's *Ecclesiastical History*.)

ASTON. [See BIRMINGHAM.]

ASTORGA, the ASTU'RICA AUGUSTA of the Romans, once the capital of the Astures, and now an episcopal town in the kingdom of Leon. Pliny (iii. 3) calls it a magnificent city. It is situated near the Tuerto, in a plain, bounded on the N. and N.W. by the mountains of Asturias; it is about twenty-six miles W. by S. of Leon, and lies in 42° 27' N. lat., 6° 10' W. long. Its vega, or plain, is very extensive and fertile, and produces excellent wheat, rye,

barley, flax, and pasture. The town, which is surrounded by a wall now in ruins, contains 3972 inhabitants, including the suburbs, four parishes, and two convents. The chapter consists of the bishop, twelve dignitaries, and twenty-two canons, all resident. The diocese contains 913 parishes. The cathedral is Gothic, and deserves to be visited on account of its altar mayor, or high altar, which is one of the best works of the famous Gaspar Becerra. This altar was built in 1569, and cost 30,000 ducats (about 3300*l.*). There is also at Astorga a castle belonging to the marquis of that name, which is in a state of dilapidation.

It was at Astorga that Napoleon assembled his army, consisting of 80,000 men, with 200 pieces of cannon, when in pursuit of General Moore, on the 1st of January, 1809. In September of the same year it was occupied by the Spanish general, Santocildes. The old ramparts were strengthened by fresh works, and the place garrisoned with 2000 men. On the 22d of March, 1810, it was invested by General Junot. Santocildes, with provisions scarcely sufficient for twenty days, without ammunition, or a force to protect the place and divert the enemy outside of the walls, defended it against the vigorous attacks of the French for nearly a month. On the 20th of April, the French being already masters of the suburbs of Puerta-de-Hierro, Retebia, and San Andres, the Spanish general offered to capitulate. Junot refused the terms proposed, and the place was carried by assault on the evening of the 21st. In 1812, Santocildes, with the Galician army, succeeded in reducing the place again, and made prisoners of the garrison, amounting to 1200 men.

(See Miñano; Ponz, *Viage de España*, tom. xi. carta 6 No. 92—99; Napier's *History of the Peninsular War*, vol. iii. book x. ch. vii.; *Annals of the Peninsular Campaigns*.)

ASTRABAD, or ASTERABAD, a province of small extent in the N.E. part of Persia. It is bounded on the north by the Caspian Sea and the Desert, on the south by the Elburz mountains, on the west by Mazanderan, and on the east by the river Gorgan, which is by some writers called Jorjan.

Except in the immediate neighbourhood of its rivers, the country is of a mountainous character. The level lands are pleasant, and extremely fruitful, producing, among other things, grapes of an uncommon size. In other parts the soil is sandy and sterile.

The province is nearly surrounded by rivers, which abound with fish, principally sturgeon and salmon. The chief town, also called Astrabad, is ten miles from the shores of the Caspian, and stands in 36° 50' N. lat., and 54° 35' E. long. The site of Astrabad has been placed so far from the sea, though the shores of the Caspian offered such great advantages, both in a commercial and military point of view. The town is believed to owe its origin to Yezid ibn Mehloob, an Arab general, and to have been built towards the end of the first century of the Mohammedan æra. The circumference of the place is about three miles and a half; the whole of this extent is surrounded by a high and thick wall, which is now in a ruinous condition. The streets are for the most part paved, and their cleanliness is promoted by a drain which runs through the centre of them. The town does not contain any public buildings which are worthy of remark.

A lake, which extends from a point three miles north-east of Astrabad towards the Caspian, has usually been considered as a gulf of that sea, and is so laid down in some maps. Lieutenant Conolly, whose travels in that quarter have recently been published, says that the waters of this lake do not approach nearer to the Caspian than three miles, and have no communication with it. He adds, that 'the water being confined, stagnates in summer, and the inhabitants of Astrabad suffer from the malaria that is caused by it.'

Astrabad is a frontier town, and chiefly inhabited by Kujurs, from which tribe the present shah of Persia has his origin: it is governed by a prince of the blood royal. The country on the northern bank of the Gorgan, ten miles from Astrabad, is inhabited by Turcomans, who are only in name tributary to the Persian government, and carry on against their more settled neighbours a constant petty predatory warfare, seizing Persian subjects whenever they can find opportunity, and selling them into slavery. (See Fraser's *Historical and Descriptive Account of Persia*; Lieutenant Conolly's *Overland Journey to the North of India*.)

ASTRÆA (zoology), a genus of fixed polypifers, sometimes incrusting marine bodies, sometimes collected in an hemispherical or globular mass which is sometimes, but rarely, lobated. The upper surface is covered with orbicular or subangular starry disks, which are lamellar and sessile. Each disk is the seat of a polype, with a single row of numerous arms, in the centre of which is the mouth. Lamarck divides these corals into two sections: the first, consisting of species whose starry disks are separated from each other, leaving interstices between them; and the second, of species whose starry disks are contiguous. Of the first section, *Astræa rotulosa*, an inhabitant of the West

[*Astræa rotulosa*.]

Indian seas, is an example: of the second, *Astræa favosa*, common in the seas of the East Indies, affords a good illustration. The species are numerous.

[*Astræa favosa*.]

ASTRAGAL, a moulding used in architecture, and applied principally to the upper ends of the shafts of columns and to their bases. It is also used in the entablatures of the Roman Doric, the Ionic, Corinthian, and Composite orders. The term is derived from the Greek ἀσπράγος, which signifies the bone on which the tibia rests, and sometimes a vertebra. The form of this moulding is semicircular, projecting from a vertical diameter. The surface is usually worked plain, although there are Roman examples of its being carved to represent leaves, as in the arch of the goldsmiths at Rome, or reeds bound together, as in the pedestal of Trajan's column. The astragal cut into beads is common to Greek and Roman architecture.

The apparent use of the astragal is, to bind the parts of columns and entablatures together, for which purpose it is employed both at the top of the shaft where the capital commences, and at the bottom where the base terminates. Many of the parts also of the entablature are bound together with the astragal moulding.

In Egyptian architecture, bands curved after the manner of astragals seem to bind the reeds of which the shaft of the column often appears to be formed. In the monument of Lycabates at Athens, supposed to be one of the oldest examples of the Corinthian order, it has been conjectured that the hollow between the top of the shaft and the lower part of the capital of the column formerly received a metal

Sections of astragal mouldings, and elevations of astragal mouldings carved: a, section of an astragal from the three columns of the temple of Jupiter (Statue), in the Campo Vaccino, at Rome; b, astragal used in the base of the Ionic order of the temple of Minerva Polias at Priene; c, enriched astragal used in the arch of the goldsmiths at Rome; d, enriched astragal of the pedestal of Trajan's column at Rome; e, astragal cut into beads.

ring of the form of an astragal, by which means, if the conjecture be well founded, the parts, from the contrast of colour, would appear to be more distinctly bound together. The most remarkable example of the use of the astragal in Grecian architecture is in the base employed in the Ionic temple of Minerva Polias at Priene; which has been imitated by Mr. Cockerell in the portico in the front of Hanover Chapel, Regent-street. In the temple of Jupiter Olympius, at Athens, the astragal at the top of the column appears to have a channel cut underneath it. (See Stuart, vol. iii.) This, however, is very unusual.

For the application of the astragal in architecture, see BASE, CAPITAL, ENTABLATURE, and FILLET.

ASTRAGALUS, an extensive genus of leguminous plants, the most remarkable species of which is the *Astragalus verus*, from which the substance called gum tragacanth is obtained. This is a small bush, with pinnated gray leaves, terminated by a spiny midrib, and half covering clusters of axillary pale yellow flowers: it is found in many parts of the Levant. Although the principal part of the tragacanth of commerce is said to be furnished by this species, it is certain that it is also procured from several others, such as *A. creticus*, which is the Poterion of Dioscorides, and *A. aristatus*, which still bears in the Peloponnesus the classical name of Tragakantha.

A few kinds of astragalus are cultivated in gardens; but they are for the most part mere botanical curiosities: the most complete account of them will be found in the second volume of De Candolle's *Prodromus*.

ASTRAKHAN, formerly called Astorokan, a khannate or kingdom in the western part of the Asiatic possessions of the Russian crown, extends northward from the banks of the Terek to the sources of the Ufa in the Yekaterinburg chain of the Ural range, and eastward from the mountains of the Volga to the south-western limits of Siberia. It lies therefore between 43° and 54° N. lat., and 44° and 60° E. long. It was one of the numerous sovereignties which Gengis-Khan and his successors incorporated with the gigantic empire of the Moguls, erected by them in the first half of the thirteenth century, but was wrested from it by Batu, his grandson, the great chief of the 'Golden Horde,' and united with the independent monarchy of Kapshak, which had the Jaik or Ural and Dnieper for its boundaries, and fell to pieces in the middle of the fifteenth century. For the next hundred years, the territory of Astrakhan, following the example of the Crimea, Kasan, and Nogay Tartary, maintained itself as a separate state under khans of its own; and the owners of a soil 'where none but swords and lances had grown, now prospered by the arts of peace.' But Astrakhan commands the western shores of the Caspian, and the mouths of the great Volga—two natural advantages of themselves sufficient to awaken the cupidity of a formidable and encroaching neighbour. In 1552 the khannate of Kasan had been added by Ivan, the great Tzar of Muscovy, to his extensive conquests; and two years afterwards, an insult to the envoy of Ivan the Second, his successor, from the khan of Astrakhan, afforded a pretext for the subjugation of the principality itself. A Russian army was sent against the town;

the khan and his subjects took to flight, and Ivan's forces entered it, as Napoleon's entered Moscow two hundred and sixty years afterwards, greeted by naked walls and tenanted buildings. Ivan re-peopled the town, and prevailed upon five hundred nobles and ten thousand Astrakhanese to swear fealty to him; the oath containing a recognition of his subjects' title to the same privilege as the natives, of using the whole line of fishery down the Volga from Kasan to the Caspian sea. Ivan was indeed ever intent upon opening new sources of trade and affluence for his subjects, as well as of political dominion for his successors. The conquest of this country was considered of so splendid a nature by the grand duke himself, that, when signing public documents, he afterwards attached its date, in conjunction with that of the conquest of Kasan, to his autograph. The khannate was comprehended in the same government with the Caucasian territories, until the year 1801, at which time part of it (the province of Caucasia or Georgiewsk) was annexed to the government of the Caucasus, and the remainder divided into three distinct governments; those of Astrakhan, Saratoff, and Orenburg. The latter have a surface exceeding that of the French or Austrian dominions, whilst their population scarcely exceeds a fifteenth part of the population of either of those monarchies; for the three governments, though extending over a space of upwards of three hundred thousand square miles, according to Weydemeyer, Hassel, and others, do not contain more than 2,600,000 inhabitants. As each of the present subdivisions of this khannate will form the subject of a separate description, we have here said as much as is requisite by way of introduction to them.

Astrakhan, the least and southernmost of the three governments, extends in a northerly direction from the banks of the lower Kuma and Manysh to the frontiers of the government of Orenburg, and eastward from the borders of that of Saratoff to the line of the Ural, next to the steppes of the Kirghish-Cossacks; it is comprised between the 45th and 52d degrees of N. lat., and the 44th and 52d degrees of east longitude, and contains an area estimated at eighty-four thousand square miles, the south and south-eastern parts of which are bounded by the Caspian. The land is, with little exception, an enormous plain, lying below the level of the ocean and Black Sea. It is divided into two parts, or steppes, by the monarch of European rivers, the Volga (a name derived from the Sarmatian, signifying 'the Great'), which winds through Astrakhan from north-west to south-east, for at least two hundred miles; the high and precipitous character of its right bank in some parts contrasting singularly with the low land which spreads out upon its left. The soil is saturated in almost every direction with salt; the very atmosphere, the rain, and dew, are charged with it; and briny lakes are of frequent occurrence. This immense plain lies so low on the 'Kalmutkaian,' or eastern side of the river, that the waters of the Caspian are driven over it for many miles, when the wind has blown for any length of time from the south-east; even vessels are at times borne by the overflow some miles inland, and stranded in the midst of the steppe, where the only alternative is to break them up. 'Here,' says Potocki, 'where the eye has no object to dwell upon but the azure sky, the steppe and lakes encrusted with salt, I was astonished to meet with a large ship lying on her beam-ends in the heart of the steppe, between Batkaly and Talagai. I learnt that, a year before, a south-easter, which had prevailed for several weeks, had inundated the country, and forced several vessels a distance of seventy versts (forty-six miles) from the shore. All but the ship in question had been taken to pieces and removed.' This traveller confirms what Pallas and Gmelin had observed before him on the optical deception which the Astrakhan steppes present: the range of sight is extended, and every object is increased in apparent magnitude. In his own case he mistook human beings for obelisks, and low heath-bushes for 'Karatshus' of ten feet height; the laden camel became, to appearance, a moving mountain. When on the Caspian, another optical deception accompanied the rising of the sun: the coast and vessels upon it seemed elevated high in the air. Even the horses in the steppe took fright at the whirlwind of trees which apparently drove across the waste; yet they were but bushes, which the blast had torn up by the roots and scattered over it. At Yenotayewsk, where the Volga winds between five islands, this portion of the steppe assumes a bluish or bluish-green tint, which

it acquires from the abundance of an extremely aromatic species of wormwood. Neither wood nor forest are found throughout the whole province, nor a tree on any spot, except a few groups of oaks, poplars, birches, elms, and wild mulberry-trees, along the banks of some of the rivers. When, however, the snows dissolve, the dry and arid steppes put on, in many parts, a gay and verdant appearance; a carpet of flowers is spread over them, and they afford a rich and refreshing pasture for the cattle, whilst the low land, which is irrigated by the adjacent streams, produces excellent grass—a valuable resource for pasture in summer, and, when cut and dried, for winter stock. Though ill-adapted to the purposes of agriculture, the Astrakhan steppes abound, in the summer season, with choice herbage, asparagus, capers, horse-radish, leeks, and liquorice; the latter, which thrives luxuriantly along the banks of the Volga, attains a height of nearly four feet, and the root is equal in size to a stout man's arm; this root is carried down to Astrakhan, where the juice is expressed, and sold in considerable quantities. The *salsola* also is of exuberant growth, and affords a supply of excellent soda. Here and there hills of sand and gypsum occur, some few of them in extensive ranges, particularly the Tshipshatshi group, east of the Volga, which is a favourite resort for the native dealers; it may be observed too of the sand-hills, that the prevalence of easterly winds is constantly impelling them farther to the west. Rocks, either of lime-stone or sandstone, rarely occur; but the province is full of extensive moors, the soil of which consists of a deep spongy saline loam, which bears no vegetation whatever on its surface; its edges only are skirted with saline plants. A country which both Georgi and Pallas conceive to have formed part of the bed of the Caspian in past ages, cannot fail to be rich in one mineral production at least—the salt, which both the Caspian shore and the soil, lakes, and moors of Astrakhan afford in exhaustless quantities and of superior quality, is perhaps the most valuable commodity which this province possesses. The bottom of many of its lakes, such as the Etsen, Bagd, and especially the Sakrisky, which yields upwards of a million of pounds weight annually, is one mass of crystallized salt; the Tshipshatshi is a perfect mountain of salt, and the summit of Bogdo-oola (about 48° N. lat. 46° 40' E. long.) is crowned by a hill composed entirely of this valuable mineral. The soil is rich likewise in saltpetre, and the works established five and twenty miles north of the capital have alone, and for many years past, produced a thousand tons and more in the twelve months. There are but few districts in Astrakhan which have any claim to be called fertile, and even these owe their fertility to artificial means. They are situated chiefly in the immediate neighbourhood of the Volga, Akhtuba, and Ural, and consist of plots of arable and garden ground, the produce of which is considerable, owing to a judicious system of irrigation. These are the only spots in the province where fruit, vegetables, grain, or vines,* are cultivated. Of all its vegetable productions, there is none more remarkable than the great water-lily, the *nymphaea nelumbo* of Linnaeus, which, we are told, is not found in any other part of the Russian empire, except at a place about five miles from the city of Astrakhan. Erdmann, who visited the spot in 1811, reports, that its leaves are two feet in diameter, and float upon the surface of the water; the stalk which bears them rises perpendicularly between six and eight feet from the bed of the water, and forms so complete a carpet, that its surface is scarcely discernible: from between these leaves issue stout runners, which terminate in a splendid rose-coloured flower of delicious fragrance. The plant is held in deep veneration by the Hindoos and natives of Tibet, from a belief that their divinities re-appear after death in the shape of these richly-scented flowers. The nuts, or capsules, of the plant are also in great request among them; and the flowers are distilled at Astrakhan into a water, which has the taste of amber, and, used as a cosmetic, gives softness to the skin. The mulberry and tobacco plant have been cultivated of late years with partial success; some cotton is grown on the line of the Volga, and madder has been introduced on its

* Humboldt, indeed, reports (in his *Ornology and Climatology of Asia*) that *finer grapes* do not exist, even in Italy or the Canaries, than at Astrakhan; but these, as well as other fruit and vegetables, however fine to the eye, are watery and insipid to the palate. The wine which is produced here is of equally indifferent quality; and we believe it to be well ascertained, that no juice of the grape which may be termed potable can be produced, unless the average temperature of the year is at least 47° or 48°.

banks. The annual produce of maize and other grain is 11,000 chetwerts (about 8000 quarters). The whole province, in short, whether the eye ranges over the Astrakhanian steppe south-west of the Volga, or the Kalmutzkaian east of it, would appear to approximate, in its general features, to the regions of the Nile: the rain scarcely ever descends upon it, its noble stream irrigates the soil with periodical inundations, and its people live under tents, herding with the camel and the zebra; 'yet no two climates under the sun,' observes Potocki, 'can offer a greater contrast; the physiognomy of the two countries is entirely dissimilar.'

The climate of Astrakhan is a 'climate of extremes'; it is generally warm, and unhealthy for those not inured to it from their childhood, in consequence of the vapours constantly exhaling from the greater part of its surface. A dry and parching heat prevails in summer, when the thermometer frequently stands, even in the shade, at 100° of Fahrenheit; yet the nights are in general nipping, and the winds deposit the saline particles with which the air is charged in such profusion, that every object appears veiled in the morning with hoar-frost. Autumn is of short duration: the winter colds, when the north wind blows, sink the quicksilver to 30° below zero, and the principal arm of the Volga, with a breadth of 750 yards, becomes covered with ice capable of sustaining loaded sledges. The various streams throughout Astrakhan are commonly closed at the end of November, but the February thaws invest the face of nature with so instantaneous a spring, that, wherever the soil is not barren, it smiles with renovated verdure under the influence of a few days' sun.

The productiveness which nature seems to have denied to the land, she has lavished upon the coasts and rivers. The great element of the prosperity of Astrakhan is the waters of the Volga, which is scarcely equalled by any other stream in the world for abundance of fish. This noble river, whose course is diverted by the mountains of its own name, which are a branch of the extensive line of the Ural, from a northerly to a south-easterly direction, at a short distance before it enters the western frontier of this province, flows through it in constantly increasing breadth and with a more winding course; before its fall into the Caspian, about thirty miles below Astrakhan, it branches into eight principal arms and sixty-five subsidiary outlets, forming this quarter of the province into a delta of seventy islands. In the spring of the year its fishing grounds, particularly between the sea and the capital, are so abundantly stocked with the sturgeon, *sevruga*, *sawak* (carp?), pike, seal, salmon, shad, and every other species which inhabit the Caspian, as to employ upwards of five thousand vessels, and twice that number of persons, who are brought by the fisheries from remote places. The isinglass and sturgeons' roe, or caviar, which add to the luxuries of our English tables, are chiefly the fruits of Tartar and Kalmuck industry. The whole produce of the Astrakhan fisheries along the Volga has been estimated as yielding a clear annual profit of 220,000*l.* to those concerned in them. The traffic on this river is another source of prosperity to the province; above five thousand *ladia*, *kayouki*, and *nosed* (ships, barks, and rafts), freighted with their respective cargoes of salt, grain, and timber, descend this stream in the course of the year, but from the difficulties of the voyage up the river, most of them are broken up and sold at Astrakhan, the 'Alexandria,' as it has been denominated, 'of the Scythian Nile.'

An expanse of sand and swamps above 250 miles in breadth, extending north-east of the delta, separates the Volga from the Ural, which forms the eastern boundary of Astrakhan and the western limit of the Kirghish-Cossack steppe: the waters of the latter stream are moderately clear, abound in fish, and are navigable for barks up the whole of its tortuous course northwards from the Caspian, and beyond the point where it quits this province to enter that of Orenburg, a distance of at least 400 miles. Both banks of this river are lined by a dreary waste of rushes, and (west of it, in the Astrakhan districts) are inhabited by the Cossacks of the Ural, who resort to its banks at certain seasons of the year for the purpose of fishing. They sell their fish in the interior of Russia, frequently to the extent of two millions of roubles (90,000*l.*) per annum. The scene which occurs at the winter fishery is of a singular description, for the fish must be taken under the ice. Several thousands of Cos-

sacks, duly licensed, hasten to the spot in their sledges, each provided with a pronged instrument, pikes, and other weapons; they station themselves on their arrival so as to form an extended line, from which none dare advance a single step under pain of having their instruments broken over their heads by the guards appointed to preserve order. The signal for the onslaught is made by the attaman of the fishery starting forward in his sledge: the whole line then breaks ground, and each rushes onwards to some spot in the frozen stream, where he effects an opening in the ice, and in a moment thousands of pikes are in motion. The dealers from the interior follow at the fisherman's elbow, and bargain for the fish before it is caught, a salvo, however, being made in behalf of the emperor, to whom the first fruits of the fishery belong. The chancery of the Uralian army derives a revenue of 4000*l.* a year from the several fisheries. But 'it frequently happens,' as a recent *Report on the Fisheries of the Caspian* observes, 'that during this (winter) fishing a violent wind blows off shore, and drives the ice, with both fish and fishermen on it, out to sea; the poor fellows are inevitably doomed to a watery grave, unless the wind should shift and blow them on shore again. We are assured by the most experienced fishermen, that their horses have a foreboding of this wind's coming on, suddenly show great uneasiness, and become almost unmanageable. Their masters, who are anything but indifferent to this signal, at once abandon their post, and hasten back to land; the sagacious animals appearing full as eager as themselves to gain it.' The other streams of note which water Astrakhan are the Akhtuba, a considerable arm of the Volga, which branches off from the left bank six miles above Tzaritzyn, runs for 280 miles close to and parallel with the main stream, and falls into the Caspian near Krasno-yarsk; and the Greater and Lesser Uzeen, which rise in the province of Saratoff, and, like many other inconsiderable rivers in this region, lose themselves in lakes on the steppes. The latter, among which we may name the Bogdo, Bashushatskoi, and Kamysh-Samara, are so many storehouses of salt, and are turned to good account by the Astrakhanese.

In the low lands on the banks of the Volga fossil elephant bones are occasionally found. Among other existing animals, there are in Astrakhan the wild ass, camel, and antelope-saiga [see ANTELOPE, p. 73], whose horns are semi-transparent; there are also the bustard, kite, falcon, pheasant, and snipe. The tarantula, scorpion, and locust, occur in Astrakhan; and Pallas speaks of having seen many porcupines with ears, one of which he observed in the act of devouring a living serpent by the tail, which could neither resist nor extricate itself. The natives are herdsmen and graziers as well as fishers; droves of horned cattle are kept wherever there is pasture, and are turned out half-starved from their wretched winter-quarters as soon as the snow has disappeared. Goats are also reared, not so much for the sake of their milk or flesh, as of their hides, with which the Russian prepares morocco-leather: there is a fine species of hair too, which either falls from the animal's back, or is combed from it, out of which a stuff of beautiful texture is occasionally woven. But the greatest resource possessed by the rural population and nomadic tribes of the province is their flocks. These consist principally of a native breed, the Kirghisian or Astrakhan species; it is of larger size than any other sheep in Asiatic Russia, somewhat resembles the deer in shape, has a wild appearance, and is distinguished by its immense bushy tail, which has been found in some instances to weigh as much as forty pounds. When full-grown, the wool of this breed is short and coarse; but the lamb yields a fine and beautiful fleece, which the dealers call a 'crimmel,' the bulk of them being imported from the Crimea. The richer class of proprietors in this and other western provinces of Asiatic Russia have begun of late years not only to introduce the Merino, Saxon, Silesian, and other finer-fleeced breeds among their flocks, but to cross and improve the native sheep with them. To the Kalmuck, Tartar, and Cossack, however, there is no animal in Astrakhan so valuable as the horse; the Kalmuck, in particular, uses the flesh and milk for the support of his household, the skin for his clothing, and the sinews for his ropes, tackle, &c. The Kalmuck species is diminutive, fiery yet tractable, and very hardy; even in winter they are wholly dependent upon what the snow-coated steppe may afford, and are consequently ill-conditioned in general, and wild; they herd close together both for society and defence, and each party is

subordinate to one of the males as their leader. When attacked by wolves or other wild beasts, they collect into a body, and repel the attack of the enemy with their heels. The whole number of domesticated animals in the province has been estimated by a recent writer at 4,000,000 sheep, 1,000,000 horses, 500,000 camels, and 200,000 horned cattle.

The population of Astrakhan is composed of a motley group of Russians, Cossacks, Tartars, Kalmucks, Armenians, Indians, and other settlers from various parts of Europe and Asia, whom the highest estimate does not state as exceeding 225,000 individuals, and the lowest, which, as it is made on native authority, is probably nearest to the fact, sets down at 80,000. Nearly one-half of this population would appear to consist of Kalmucks, who occupy large tracts to the east of the Volga; the number of their kubitkes, or tents, being computed at 13,100. Another considerable portion of the population is composed of the Cossacks of the Ural, who are esteemed the finest, the wealthiest, and the bravest Cossack corps in the Russian service, whence they have acquired the appellation of 'the Eye of the Army,' and garrison the small forts along the line of their native river; some have estimated the number of their fighting-men at 20,000, but this would give an amount of population to this single race of Astrakhanese, which would far exceed any estimate yet formed of their numbers. Independently of these, there are a few colonies of Tartars of Kasan extraction, about 1600 yurtas or tents of Nomadic Kunduroff-Tartars, or Manguttes, descendants of the Nogay horde, who lead a wandering life in the regions of the Lower Akhtubia; and, as some writers report, 12,000 kubitkes of Bukay-Tartars, who settled in the districts between the Volga and the Lesser Uzen about thirty years ago, and made an attempt to remove to the steppes east of the Ural in the year 1829, but were forced back by superior force.

To the principal branches of industry already enumerated we may add the manufacturing of magnesia, tallow, and soap, in considerable quantities, distilleries of brandy and spirits, some large leather, and a few silk and cotton, manufactories. Astrakhan soap is in much request among the Russians on account of its firm substance and fragrant scent. The Volga, which secures a ready access to the eastern shores of the Caspian Sea, has hitherto rendered the capital of this province the principal seat of the traffic carried on between Asia and the Russian dominions.

Astrakhan is politically divided into four circles: Astrakhan, Krasno-yarsk, Yenotayewsk, and Tsherno-yarsk; but there are no spots in it deserving of any distinct notice excepting the capital, from which the whole province derives its name, and Uralskoi, the chief town of the Cossacks of the Ural. Of the remainder, the short account which follows will convey a sufficient idea. At a distance of somewhat less than five miles above the city of Astrakhan, we find *Kalmüzkoi-Basar*, a place on the right bank of the Volga, in which all sale and barter between the townsmen and the wandering people of the steppes is carried on. In the market-place stands the Russian, with his brandy, bread, and coarse household stuff; the Armenian with his wine and inferior stuffs for clothing; the Tartar, in quest of sheep for the Astrakhan market; and the Circassian, hard at work in making ironware and leather articles. Here the Kalmuck also resorts with his supply of domestic manufactures, cattle, and felt. 'These sons of the steppe are seldom a match for their customers,' says Potocki. 'Here you may see Tartars from Kuma, Kuban, and the Five Mountains; Truchmens, Nogays, Kiptshaks, and Cossacks from the Jaik; but, above all, it was this traveller's fortune to meet a Kirghisian embassy in the Bazar, who had but little of the air of diplomatists about them.'

About nineteen miles to the north-east of Astrakhan lies 'Krasnoi-yar,' the capital of the circle of that name; a small town of about 2000 inhabitants, with two churches, built on an island formed by the Algara, the Akhtubia, and Basan, three arms of the Volga, and surrounded by dilapidated walls with wooden towers, which were constructed by the Tzar Alexis Michailovitch to protect the town against the incursions of the Cossacks and Kalmucks. The inhabitants live comfortably upon the produce of their fishery, and of their gardens, orchards, and vineyards, which are situated on each side of the hills, east of the town. It is celebrated for its asparagus, the eatable stem of which is above twenty inches in length.—'Yenotayewsk,' another capital of a circle, situated on the steep right bank of the Volga, is the seat of a tribunal, which has jurisdiction

over the 4900 kubitkes of Kalmucks who pass the winter in its vicinity: it is a circle of houses, built round a small fortress, and inhabited by Cossacks and traders.—'Tsherno-yar,' also the capital of the circle in which it lies, and a well-fortified town, is likewise on the right bank of the Volga, about 150 miles north-west of Astrakhan. It consists of 300 houses, is built in the shape of a polygon, with five entire and two semi-bastions, has a stone church embellished with two towers, having gilt cupolas, is an opulent place, and contains between 1500 and 2000 inhabitants. The circle of Krasno-yarsk comprehends the tract of country which lies along the course of the Ural, and is inhabited by the Cossacks who take their name from that river. At its influx into the Caspian stands the small but strong fortress of 'Guri-Gorodok,' built upon an island, thirteen miles up the river and 500 south-west of Orenburg, under the government of which province it was placed in 1753. The inundations, which cover the whole face of the island in the spring, render it in the highest degree unhealthy; it is consequently inhabited by few individuals besides those composing a regiment of Cossacks and a company of infantry. A redoubt, called the Guriewskoi-Redoubt, lies about twelve miles farther up the river. Along the line of the Ural are numerous *Walogys*, or fishing villages, erected for the fishermen of the crown, containing dwellings, storehouses, workshops, rope and net yards, every convenience for boiling down oil and making caviar, and even cellars for ice, which is used for keeping the fish fresh. (Georgi, Pallas, Gamba, Potocki, Sommer, Stein, &c.)

ASTRAKHAN (city). The present capital of the government of this name is about six miles higher up the Volga, as some maintain, than the Astrakhan, or rather Adshotarkhan, which was the metropolis of the ancient kingdom, and, according to Forster, was demolished, together with Sarai, its neighbour (the 'urbs magna, sedes regia Tartarorum' of Abulfeda), by Timour in the winter of 1395. Other writers however are of opinion that the ancient capital stood between the banks of the Akhtubia and the Volga, forty-six miles higher than the present city, on a spot which was occupied by a manufactory of salt petre some years ago. Both of these conjectures rest on plausible grounds, for both sites contain the remains of extensive buildings; and each of these masses of ruins has contributed large portions of the stone with which the public edifices in the modern capital are constructed. Astrakhan, which is become the principal seat of Russian intercourse with Asia and the storehouse of fish for the whole empire, stands on the island of Zaietchy Bugor, or 'the Hare's Mound,' which lies between the small river Kutum and the Volga, about thirty miles from its mouth, and 820 miles south-east of Moscow. It has a navigable communication also with St. Petersburg, from which it is upwards of 1200 miles distant; yet its importance must always remain of a limited character. Astrakhan ranks however as the eighth town in the Russian dominions; its stationary population being about 40,000,* and its whole circumference rather more than three miles. The uneven ground on which it stands, its half-decayed battlements, and a multitude of steeples, minarets, and cupolas, give it a handsome appearance at a distance; and the effect is heightened by contrast with the flat marshy ground which surrounds it. The climate of such a site cannot rank among the healthiest; and it is liable, moreover, to very sudden changes of temperature: yet, as the average population throughout the year, including the thousands who resort to the spot in the fishing seasons, cannot be under 50,000, and the average deaths do not, according to Gamba, exceed 1400, the mortality, which amounts to 1 individual in about 36, is not much greater than that for all Russia, which amounts to 1 in 38; or even for France, where Bickes estimates it at 1 in 39. A long canal traverses Astrakhan from east to west, the direction of its greatest length. The town is irregularly built, and the houses present a singular medley of European and Asiatic taste; they are constructed principally of wood, and are in number between 4000 and 4200. Astrakhan is the seat of an Armenian as well as Greek archbishopric, under the former of whom there are four, and under the latter twenty-five, churches; besides these, the Roman Catholics, Lutherans, and Hindoos, have each their separate place of worship, and the Mohammedans

* In 1827 Weydemeyer stated the number of inhabitants to be 37,000, which is double the number which the town contained at the close of the last century, when Georgi says the official return reported it to be only 18,023.

have nineteen mescheds or mosques. There is a Scotch mission too in the town, which, Keppel tells us, is a branch of a colony at Karass in Circassia or Cabardia, whose affairs are managed by their own laws, except in criminal cases; they are at liberty to make converts of Mohammedans or heathens; pay no taxes but about five kopecks (one half-penny) for each acre of arable land, and are authorized to purchase Russian or Georgian slaves, provided they emancipate them at the end of five years. Independently of an academy for marine cadets and a Greek seminary for ecclesiastics, there are a high-school, a district grammar-school, and four inferior schools in the town for the education of native-born subjects: two printing-houses (a Russian and an Armenian) are sufficient to supply its present wants. The chief architectural ornaments of Astrakhan are the 'Kreml' or citadel, which contains the cathedral and barracks; the 'new' or 'white' town, so called from its being embellished with the principal government buildings and the three factory halls, one for the use of the Russian, another for the Asiatic, and a third for the Hindoo dealers; the beautiful street inhabited by the Persian merchants, on each side of which runs an arcade, supported by handsome columns; and the cathedral, which was erected in 1696, and, like most ecclesiastical edifices in Russia, consists of a massive parallelogram with four small cupolas on the roof, and a large one in the centre, from which the building receives its light. The interior is splendidly though not very tastefully decorated; but it is prized among the followers of the Greek faith principally on account of its holy treasures—an effigy of the Virgin Mary, whose parthenalia are said to have cost 800*l.*; six valuable mitres inlaid with pearls and precious stones of extraordinary size; a baptismal font of massive silver, ninety-eight pounds in weight; and some fifty or more splendid attires for the celebration of the mass, one of which has been four centuries in use. The Jesuits' and Greek-Armenian churches are also handsome structures; but the most singular building is a beautiful mesched of free-stone, lately erected by a wealthy private individual, which differs in every respect from the usual form of Mohammedan mosques, and resembles the Christian churches of the East in shape. The 'Kreml' is an ancient Tartar fortress, surrounded by stone walls and battlements eighteen feet high. The remainder of the town comprises sixteen 'slobods' or suburbs, beyond which the progress of modern improvement has transformed moor and swamp into places of public resort and agreeable promenades. Warazi, a Greek of large property, has been the great reformer of Astrakhan in every thing concerning the improvements outside of the town; which are not only extensive, but judiciously planned and executed.

It has been calculated that, in the fishing season, the population of Astrakhan is increased by at least 30,000 souls; a motley concourse, collected from almost every quarter of Asia and Europe, of whom nearly one-third are Russians. The latter, with the exception of a few noblemen, and the military and civilians, are exclusively traders, and many of them in affluent circumstances. 'You cannot form an idea,' says Gamba, who visited Astrakhan in 1820, 'of the throng of splendid equipages which make their appearance on festive occasions, particularly at Easter. The dress of the women is of the most sumptuous description at these seasons: they are attired in a robe of gold or silver tissue; and the head, arms, neck, and waist, are covered with pearls and precious stones.' The Russian of Astrakhan has, however, adhered in general to his old customs and predilections; he remains no less an enemy than ever to a shaven chin and the fumes of tobacco, or any other innovation: he has continued stationary in taste, and in intellect too, if it be true, as Erdmann reports, that 'his only resource, when in society, is eating, drinking, and card-playing.' The Tartar inhabitants of the town are stated by Gamba at 10,000; they are of three distinct races, the Ghilan (of Western Persia), Bucharian, and Agriskhan (or 'mixed race,' being the issue of Hindoos settled in Astrakhan and Tartar women), each of whom occupy a separate division of the Tartar slobod. These settlers are highly commended by the same writer for their unswerving integrity. The Armenians are among the richest traders in the town: a considerable proportion of them have laid aside their robes, caftans, broad trowsers, small boots, and high fur caps, and adopted the European costume; but their wives and daughters still move about, covered from head to foot with an enormous white veil, which conceals the whole person except

a small part of the face. The Georgians of Astrakhan are mostly mechanics, and the better class of them are very cleanly, and show much taste in their household arrangements. As temporary residents only we may include the dealers who visit Astrakhan from China and Bucharina; the Kalmuck, too, is accounted a stranger, although he has his wooden hut or felt tent permanently standing in the outskirts of the town. Fishing is his constant occupation. The Hindoo population, though on the increase, does not exceed three or four hundred: most of this race are natives of Multan and Lahore, and they bear the reputation of living but for the gratification of two master-passions—love of flowers and love of money. Their stores in the Indian bazaar have, each of them, a flower-bed in front; and they are never without a nosegay between their fingers, which goes the round of every customer's nose. Their business is to lend money on as usurious terms as possible, and their accumulations being seconded by the utmost simplicity and parsimony in their mode of living, they rise quickly into affluence. We need only allude to the European residents as a motley assemblage of traders, artisans, teachers, government officers, and artists from north, south, east, and west.

The establishments for weaving silks and cottons at Astrakhan are nearly one hundred in number; it manufactures also considerable quantities of leather, particularly a superior description of morocco and shagreen, as well as tal low and soap. The numerous gardens in the town and its environs produce, by means of irrigation, several fine species of fruit, especially grapes, of which above a dozen sorts are frequently seen in a single ground: these are dried, and form a considerable article of export to the interior of Russia. In all respects, this place has long held the same station with regard to the trade of the south, which St. Petersburg, Riga, and Archangel occupy with regard to that of the north, of Russia: but its commerce is greatly on the decline, for in 1824 it employed between four and five hundred vessels of all sizes, which landed merchandise in the town to the amount of 340,000*l.* (7,449,615 roubles), and took on board wares in return to the value of 310,000*l.* (6,955,515 ro.) whereas, in 1832, the importations did not exceed 20,700*l.* (452,317 ro.), nor the exportations 41,800*l.* (913,029 ro.) in value. In the latter of these years, however, the trade of Astrakhan was much crippled by the combined effects of the cholera and the disturbances which broke out in Daghestan. The business of buying and selling, more than one-half of which has been engrossed by the Armenians, is conducted in twenty-eight khans or bazaars, which contain 1500 stores built of stone, and 560 wooden stalls. Raw silk and silk goods, cotton and cotton-yarn, drugs, dye-stuffs, carpets, oil, rice, and other eastern productions, form the chief importations: the exportations are principally woollen cloth, linens, cochineal, velvet, iron, salt, fruits, fish, wine, liquorice, soda, hides, skins, and grain.

In speaking of the province itself, we mentioned the great fisheries carried on in the Caspian and along the Volga. The fisheries of the Volga centre principally at Astrakhan, or rather on the branches of the river some distance below it. Every wear has its group of huts, with a little church attached to it, in which from two to three score fishermen reside; they are divided into divers, catchers, salting-men, and makers of caviar and isinglass. Each little colony is provided with spacious ice-cellars, which contain compartments for storing away the fish when salted, with intervals between the compartments which are filled with ice. The spring fishery opens with the spawning season, when the ice breaks up, and the fish enter the river from the Caspian; they are preceded by innumerable shoals of small fry, some descriptions of which, particularly the obla, are caught and used as bait for the larger species which succeed them, such as the sevrouga, sturgeon, and bidonga. The fishing season, both on the Volga and Caspian, closes about the middle of May, when the fishermen return for a time to Astrakhan, and sell their stock. The fish move out of the Volga in the autumn; and this is a signal for the men to recommence their operations, which are prolonged to the depth of winter; the fish being frozen at this season when they are brought to land, are more easily preserved. Prince Kourakhin is the proprietor of the fisheries at the mouth of the river and within the territory of the town of Astrakhan, but he has gratuitously given the right of fishing to the citizens; and this is no inconsiderable donation, for there have been years in which he has ceded

his entire right for 40,000*l*. Many of the Astrakhan dealers also send out parties in spring and autumn to take the seals along the shores of the Caspian islands, where they are flayed and salted, and forwarded to Astrakhan for the sake of their skins and the oil extracted from the carcass.

Besides the ruins of Adshotarkhan, to which we have already referred, vestiges of Tartar dominion in former ages lie scattered in various directions over the steppes which surround Astrakhan. The greater part of them are sepulchral mounds, here and there distinguished by uncouth figures, carved in stone: their features and attire obviously stamp them of Mongolian origin. There is probably no monument of this description more curious than the sepulchral mound near Prishibinskoi, a village on the Akhtuba. It is raised on a quadrangular substructure of earth, and consists of six flat vaults abutting one against another, the whole being about 900 feet in circuit and 18 feet in height. The mortar with which the walls are cemented has become as solid as the hardest stone, and resists the impression of the strongest instruments. It would seem, from the vessels and ornaments which have been found within it, that this structure was formerly a place of interment for some princely family. Astrakhan has a dockyard and arsenal, and is the port of rendezvous for the Russian ships of war which cruise in the Caspian. It is in 46° 21' N. lat., and 47° 55' E. long.

ASTRINGENTS (from *astringo*, to constringe, or bring closer together), are agents which contract the fibres of the muscles and blood-vessels, and lessen the flow of fluids, whether it be the secretions of the glands proceeding from their natural orifices in excessive quantity, or the contents of the blood-vessels escaping by their exhalant extremities, or by an unnatural opening (or rupture). They produce this effect, generally by a vital, but sometimes by a chemical action. Their power is manifested first, and often solely, on the part to which they are applied; yet in many instances it is extended by sympathy very rapidly over the whole body, as is observed when the acerb juice of the sloe is brought in contact with the tongue. The sensation then experienced may be considered the best general test of the presence of *astringency*, which cannot be ascribed to any one principle, but is owing to tannin, gallic acid, and hæmatine, in vegetable astringents, and is possessed by acids, and many metallic salts among mineral agents; and is also one of the effects of the application of cold to the body. In vegetables, the astringent principles are found chiefly in the bark (as oak), the root (as rhatany and tormentil), and the wood (as logwood). As wood and bark form parts of *exogenous* trees only, it is only from this section of the vegetable kingdom that any astringent principles can be obtained. [See explanation of the term *exogenous*, under the article *AGE OF TREES*, vol. i. p. 202.] Sir Humphry Davy found that the inner layer of the bark possessed the greatest quantity of the astringent principle: this is the natural consequence of the mode in which the sap descends from the leaves, viz., through this inner layer of bark, whence it occasionally passes into the wood, which will then be found to possess principles similar to those of the bark. Most astringent vegetables are red, owing to the presence of an acid in excess—which is often manifest to the taste, as in rumex, or sorrel. In metallic astringents, when super-salts, the excess of acid, is also very perceptible to the taste, as in alum, which is a supersulphate of alumina and potassa.

The particular principle to which any substance is indebted for its astringent power may be ascertained by appropriate tests. When *tannin* exists in plants, its presence may be proved by an insoluble precipitate taking place on the addition of a concentrated solution of gelatin. The precipitate is a compound in definite proportions of tannin and gelatin, being forty-six of tannin and fifty-four of gelatin. Gelatin has therefore been proposed by Sir Humphry Davy as a test of the quantity of tannin in different astringent vegetables. (See *Philosophical Transactions*, 1803.) But in the practical application of this test there are some sources of fallacy difficult to guard against. (See Papers by Dr. Bostock in Nicholson's *Journal*, vol. xxiv. 1809, and by Mr. E. B. Stephens, in *Annals of Philosophy*, New Series, vol. x. p. 401.) Tannin rarely exists alone, though it probably does so in catechu, but mostly along with gallic acid. Extractive is also a frequent accompaniment of tannin, and is of considerable service, assisting its action in the process of tanning. Gallic acid strikes a bluish-black precipitate with all the salts of iron, but a solution of the persul-

phate is the ordinary test. Hæmatine exists in logwood, along with tannin and extractive. It may be known by combining with oxide of lead without undergoing any change.

The effect of astringents which is due to their chemical action is nearly the same in dead as in living animal matter; their long-continued application to the skin will produce a condition similar to that of a tanned hide. They are, therefore, sometimes employed to effect this, when internal parts are exposed, to change them from a secreting to a non-secreting surface—such as in irreducible prolapsed uterus. Their use in this way, however, is very limited; while their vital action is extensive and important. The chief effects of astringents are to contract the muscular and vascular tissues, to diminish secretion, and lessen irritability; and in many instances to impart strength, or increased tone, to an organ or part. Their action is always greatest on the part to which they are applied. When a drop of diluted acetic or sulphuric acid is applied to the skin, whiteness of the part is observed, which soon disappears, and the natural colour, or even a more intensely red one, follows. If this is frequently repeated, the structure of the part is changed, it ceases to secrete, is no longer pliant, but becomes stiff and inflexible. The loss of colour is owing to the diminished calibre of the blood-vessels, which no longer admit the red globules. During the absence of these, the sensibility of the part is less than natural; just as cold and torpid fingers lose their fineness of touch. Nearly similar effects may be supposed to follow the internal administration of astringents, the action of which is greatest on the intestinal canal, and less on parts remote from this: yet it deserves to be remarked, that as the intestinal canal is a mucous membrane, and possesses a muscular structure, parts of a similar structure are more influenced by astringents introduced into the stomach than other parts are; hence, increased secretion from the mucous membrane of the lungs, or from the lining membrane of the bladder, or flow of blood from arteries, is more effectually checked by astringents, than increased exhalation from serous surfaces. There is reason to believe that the astringent principle of many plants does not enter into the circulation, but passes along the whole course of the intestinal canal without being absorbed: for Sir Humphry Davy found, that when tannin is present in grasses, as it is in that of *aftermath crops*, it is voided in the dung of the animals which feed upon it. (See Davy, *Elements of Agricultural Chemistry*, Appendix, p. lxi.) But that of other plants enters the system so rapidly, that the astringency of the *uva ursi*, or bear's whortleberry, can be detected in the urine forty-five minutes after it has been swallowed. In the case of those which do not enter into the circulation, any beneficial effect which they exert upon remote organs must be attributed to that sympathy which exists in so great and unquestionable a degree between the stomach and almost every organ of the body. That such vegetable substances, while passing along the intestinal canal, promote the fulfilment of its functions, is obvious, from the effects following the use of food in which astringent principles are absent. Plants possessing astringent powers and bitter principles, such as tormentil and the bog-bean, are very efficacious in preventing the rot in sheep, (as has been already stated under Anthelmintics,) while watery grasses, among which no astringent plants grow, favour the generation of worms.

The primary sympathetic effect of several of the astringents which ultimately enter into the circulation, is the most valuable in some of the cases in which they are employed, such as dilute sulphuric acid, which often checks hæmorrhage by closing a bleeding vessel, before any of it can be conceived to have been conveyed directly to the bleeding orifice; it checks the flow of blood in the same way as cold suddenly applied to the surface or skin does. The tonic effect of many astringents, after their use for some time, first on the digestive organs, and afterwards upon the whole system, and more especially upon any weak organ, must be admitted, and borne in mind, in forming our estimate of their utility in a curative point of view. Without attempting to account for the ultimate cause of the action of astringents, to do which successfully seems impracticable in the present imperfect state of our knowledge, it may be stated, that under their influence a tension of the parts is produced, during which the muscular and vascular structures acquire an increase of power, and secreting surfaces and glands produce less fluid but more natural secretions. Some, indeed, lessen the action of the heart, and

stop the flow of blood from dilated or ruptured vessels, such as the preparations of lead, which though in some degree astringent, ought to be considered as *sedatives*; while others which combine with and neutralize the unhealthy or excessive secretions, as lime and its carbonate with the secreted fluids of the intestinal canal, are more properly termed *absorbents* than astringents. When astringents are applied directly to the bleeding vessels, such as to external wounds, or to the nostrils or gums, they are termed *styptics*, and in such cases they often act chemically as well as vitally.

Before proceeding to consider the cases in which astringents may be advantageously used, an enumeration of the most common and valuable substances may be given. Of vegetable astringents the chief are *barks*, as of oak and willow, the best kind of the former of which is obtained from the *quercus robur* of Linnaeus (the true British oak), which is synonymous with the *quercus pedunculata* of Willdenow, while the inferior sort is obtained from the *quercus sessiliflora* of Salisb., which is synonymous with the *quercus robur* of Willdenow. The best willow-bark is procured from the *salix pentandra*, or sweet bay-leaved willow, though very excellent bark is yielded by the *salix Russeliana*, or Bedford willow.

Roots, as of tormentil, from *potentilla tormentilla*; bistort (*polygonum bistorta*); common avena, from *gum urbanum*, which are British plants; and rhatany, *Krameria triandra*; rhubarb (*rheum palmatum*); pomegranate (*punica granatum*), which are exotic plants; leaves of *arctostaphylos* (*uva ursi*), petals of the *rosa gallica*, fruits of *prunus spinosa*, or alce-thorn (*punica granatum*), and secreted juices of many plants, as kino, from *pterocarpus Senegalensis*, and several others; and catechu, from *acacia catechu*, and galls, from *quercus infectoria*; in all of which the astringent principle is tannin, with more or less of gallic acid; and lastly log-wood, (*hamatoxylon Campechianum*), in which hæmatine as well as tannin possesses an astringent property. Acetic acid must also be classed among the vegetable astringents.

The mineral astringents are, diluted sulphuric acid, and salts of iron, zinc, copper, silver, and the salts of lead. Cold, in whatever way applied, is also a valuable astringent. In treating of the employment of astringents as curative agents, it is necessary to distinguish between their action as local, direct, and often chemical, and their action as general, influencing remote organs, their effects upon which are vital rather than chemical: also between their mere astringent power and their tonic power. The beneficial effects of many of the above-named astringents in checking increased secretion, is doubtless often due to their tonic power; for as in a weak state of the system, or of any particular gland, the secretions are generally profuse in quantity, a return to the healthy proportion and quality can only be insured by increasing the power or tone of the body or gland, which astringents do by bringing the living tissues into a closer or more compact state, and which tonics do by heightening the vitality of the debilitated structures. Hence astringents are beneficially employed in diseases where a laxity of the muscular and vascular tissues exists, accompanied with imperfect discharge of the functions of the secreting organs. The stomach and intestinal canal being the channel by which is conveyed the material necessary for the nourishment and vigour of the system, and for maintaining a capacity to discharge their functions in the other organs of the body, an impaired state of the structure and functions of this canal extends to every other part. The re-establishment of its healthy condition is a primary object in endeavouring to cure many diseases. Of these, intermittent and remittent fevers may be taken as an example, since in these there is always great debility of the digestive organs and of all the parts which have the most intimate sympathy with them, such as the skin. Astringents possessed of a tonic power have therefore mostly been resorted to in order to remove this debility; cinchona-bark, willow-bark, and many others, have been used with this intention. These, however, are to be avoided whenever any acute inflammation exists, which must first be subdued by appropriate means before tonic astringents can be safely or advantageously used. In diseased states of the intestinal canal, in which greatly increased or unhealthy secretions take place, as diarrhoea, dysentery, and cholera, the most careful inquiry should be made into the cause of the disease, that if it has its origin in an inflammatory condition of the mucous membrane of the intestine, or is owing to the presence of any acrid sub-

stance, the former may be overcome by antiphlogistic measures, and the latter be removed by purgatives. When the increased flow from the intestines is connected with increased determination towards those parts, owing to the application of cold to the outer surface suppressing the secretion of the skin, which has the greatest sympathy with the internal surface, and which consequently is excited to double action, a preternatural quantity of secreted fluid is produced. The most effectual, as well as only safe, means of diminishing this, in the early stages of its occurrence, is the employment of diaphoretics, or such medicines as restore the action of the skin; after which, should the discharge continue, mild astringents may be used, of which logwood or tormentil is the best. A preliminary treatment is likewise required in dysentery: in the common cholera a purgative should generally be given before any astringent is administered.

In the bilious cholera of autumn, after the employment of suitable purgatives, nothing seems to act more effectually as an astringent than the infusion of cusparia, or angustura bark, with dilute nitric acid; to which, in some cases, a small portion of laudanum may be added at first, but afterwards omitted. Nor in the epidemic cholera, as far as a very limited experience enables us to judge, has more marked benefit followed the use of any means than has resulted from the employment of this combination, which speedily checks the liquid discharges, and restores the circulation and animal heat.

Diarrhoea, or looseness of bowels, proceeding from acid secretions, is best removed by the astringents which combine chemically with these—such as lime, or its carbonate, which are rendered more suitable by uniting them with aromatics, an excellent form of which is supplied by the *potio carbonatis calcis* of the Edinburgh pharmacopœia. Sometimes, in order to increase the astringent power, as it is supposed, carbonate of lime is prescribed along with the vegetable astringents; but nothing is more erroneous than this proceeding, by which a decomposition is occasioned, which destroys the virtues of both the ingredients. Nor is the combination of opium with chalk less objectionable.

The next most important class of diseases in which astringents may be employed are termed hæmorrhages, or a discharge of blood, either from the exhalant extremities of the arteries, when they are gorged or when they are too much relaxed, or from the wounded or ruptured coats of any blood-vessel. The above distinction refers to the differences between active and passive hæmorrhage, or that which takes place when the system is too full of blood and the vessels propel it with great force; the other, which takes place when the power of the vessel is greatly below the natural standard. In the former, astringents cannot safely be employed at the commencement of the flow of blood, but time should be allowed for the vessels to unload themselves; or a vein should be opened, cooling saline medicines administered, cold air admitted freely to the surface of the body, and, under competent medical attendance, opium or laudanum may be given; after which, astringents will either not be required, or if so, may be safely used.

In passive hæmorrhage they may be employed from the commencement; and perhaps, in most cases, a saturated solution of alum in the infusion of roses is to be preferred, though the tincture of the muriate of iron is very eligible when the kidney is the source of the bloody discharge, as acetate of lead is when the lungs are the organs whence the blood flows. So long as lead is kept in the state of an acetate, its administration is perfectly safe: it should therefore always be accompanied with dilute acetic acid.

Bleeding from the nostrils or gums may be checked by the direct application of styptics; such as preparations of zinc or copper. Nitrate of silver will frequently stop the flow of blood from a leech bite. Cold should, in most cases, be employed along with the other means; even alone it is often successful, especially in the form of water poured from a height in uterine hæmorrhage. Ruspini's styptic, which is said to be a solution of gallic acid in alcohol, is sometimes useful, where other means have failed.

The application of astringents to more limited examples of loss of tone or increased flow of secreted fluids, need not be extensively noticed here. After acute inflammation of the eye, proper antiphlogistic means having been used, astringent applications are very serviceable, especially those of zinc and nitrate of silver, either in solution or made into an ointment. Scrofulous inflammation of the eye is often benefited by them, if internal means be also used.

tion, or excessive flow of saliva, occurring either spontaneously or from the use of mercury or other means, is often effectually checked by nitrate of silver, or decoction of the rhus glabrum, or by iodine. Nitrate of silver, by lessening the inflammation which gives rise to them, also frequently removes morbid discharges from other mucous surfaces besides those we have specially noticed; an effect which also often follows the use of diluted chloride of soda. The colliquative sweats of hectic fever are best checked by giving internally dilute sulphuric acid, and sponging the skin with vinegar and water.

Astringent substances are decomposed by, or decompose, many others, which therefore should not be given at the same time with them; such, for example, as ipecacuanha with most of the vegetable astringents which contain tannin, by which an insoluble tannate of emetina is formed: when kino is united with calumba, a purgative action follows. All astringent vegetables containing tannin, except oak-bark, decompose tartrate of antimony, and are therefore the best antidotes to it.

The ancient Egyptians would appear to have been acquainted with the power of astringents in preserving vegetable as well as animal substances, and they seem to have dipped the coarse cloths in which the mummies were enveloped in some astringent liquid, which tanned the skin, and rendered it less subject to change, as well as excluded the air from the interior of the body. The article employed by them with this view is supposed to have been some sort of kino. The same substance is used by the Chinese to dye cotton for their nankeens.

This property of astringents may be usefully applied for the preservation of all kinds of cordage, fishing-lines, and nets, which last much longer if steeped in an infusion of oak-bark. Though inferior in preserving power to the plan of Mr. Kyan, it may be applicable in some cases where his is inadmissible. [See ANTISEPTICS.]

For further information on astringents, see Dr. A. T. Thomson's *Elements of Materia Medica and Therapeutics*, vol. ii., in which much recent valuable matter is brought together.

[For the employment of astringents in the arts, see DYEING AND TANNING; and also *Library of Entertaining Knowledge*—Vegetable Substances; Materials of Manufactures, p. 178.]

ASTROCARYUM, a genus of palms found in small groups, or in single specimens, in the tropical parts of Ame-

(*Astrocaryum murumuri*.)

rica, of middling stature, and of a very singular appearance on account of the spines with which they are armed. Their stems are covered all over, except at the places where the leaves are set on, with stiff and very numerous prickles. The leaves are pinnated. The fruit resembles cocoa-nuts.

These plants are found exclusively in South America, where several species were collected by Dr. Von Martius, the great illustrator of the palm tribe. Among the more remarkable are, *Astrocaryum murumuri*, a common inhabitant of swampy places in the neighbourhood of Para, where it is called *murumuri*; the flesh of the fruit resembles the melon in flavour and the musk in odour, and is considered a great delicacy by the Americans. We give a figure of it, but so much reduced, that the armature of the stem cannot be shown. Its leaves are found to be an excellent thatch.

Another species, *A. airi*, has very hard wood, which is much used for bows, and similar purposes, where hardness and toughness are required.

The fibres of the leaves of *A. rucuma* are much valued for fishing-nets. (See Martius, *Palms*, p. 69, &c.)

ASTROLABE, from two Greek words signifying *to take the stars*. It has an earlier and a later meaning. As used by Ptolemy, it may stand for any circular instrument used for observations of the stars; but in the sixteenth and seventeenth centuries, it signified a projection of the sphere upon a plane, being used in the same sense as the word *Planisphere*. To this small projection, which had a graduated rim, sights were added, for the purpose of taking altitudes; and in this state it was the constant companion and badge of office of the astrologer. In later times, before the invention of Hadley's quadrant, a graduated circular rim with sights attached, called an astrolabe, was used for taking altitudes at sea, as further described in *Bion*, *Traité des Instrumens de Mathématique*. Hague, 1723. In the older sense of the word every one of our modern astronomical instruments is a part of the astrolabe, the principle of which we proceed to describe.

If a solid circle be fixed in any one position, and a tube be fixed upon its centre, round which it may be allowed to move, as in the adjoining diagram; and if the line C D be drawn upon the circle, pointing towards any object Q in the

heavens which lies in the plane of the circle, it is obvious that, by turning the tube A B towards any other object P in the plane of the circle, the angle B O D will be the angle subtended by the two objects P and Q at the eye, or their angular distance upon a common globe. This angle may be measured, if the circumference of the circle be graduated. Thus, suppose the plane of the circle to pass through the poles N and S, and C D to point towards the equator; then when the tube points towards the star, N O B its north polar distance, or B O D its declination, may be measured. Or if the circle be fixed in the plane of the equator, and C D be made to point towards the vernal equinox at the same moment at which the tube points towards the star, then the angle D O B will be the right ascension of the star.

A collection of circles, such as the *Armillary Sphere*, might therefore, by furnishing each circle with tubes, be made a complete astrolabe. The practical difficulty consists in keeping so many circles exactly in their proper relative positions. The distinction between the astrolabe of the ancients and the circular instruments of the moderns, is as follows. First, the ancients endeavoured to form an astrolabe of two circles, so as to measure both latitude and longitude, or both right ascension and declination, by the same instrument; while the moderns, in most cases, measure only one of the two. Secondly, the ancient instruments were made to revolve, to find the star, or were furnished with at least one revolving circle, moving round the pole of

the equator or ecliptic, according as declination or latitude is to be measured. The moderns for the most part fix their instruments in the meridian and wait for the star. But the *equatorial*, the altitude and azimuth *circle*, and the *theodolite*, are strictly astrolabes, according to the ancient meaning of the term.

Hipparchus is the first we know of who can be reasonably supposed to have made use of an astrolabe. But, at the same time, there are reasons for supposing that Eratosthenes, a century before Hipparchus, made use of a circle fixed in the meridian, for measuring the obliquity of the ecliptic. He is also said to have erected armillary circles at Alexandria. Ptolemy does not mention Hipparchus expressly; but he was in all respects his follower, and therefore probably, in describing his own instrument, he is only repeating that of his great predecessor. And Nicholas Tabasillas (an ecclesiastic of the fourteenth century, cited by Delambre) attributes to Hipparchus an instrument consisting of an equator, a meridian, and two tropics. It is impossible, from what we know of Hipparchus, that he could have done without something of the sort. At the same time, between Hipparchus and Ptolemy we have no observations to settle this point.

The description of Ptolemy (*Syntaxis*, book v. ch. i.) is as follows:—Fix two perfectly equal circles at right angles to each other, and let one represent the ecliptic, and the other the solstitial colure. In the poles of the ecliptic place cylinders, projecting within and without beyond the rims of the solstitial colure, and fix on these cylinders as pivots outer and inner circles, which shall revolve freely without and within the first mentioned circles. These are evidently circles of longitude. Within the innermost, and in its plane, place a lighter circle, sliding by friction, and having two sights diametrically opposite, by which the latitude of any celestial phenomenon may be observed when the instrument is adjusted, *i. e.* when the circle representing the ecliptic is in the plane of the true ecliptic. To effect this, cylindrical pivots are inserted in the solstitial colure in the points corresponding to the poles of the equator, and the whole of the apparatus is suspended within a circle which is placed in the meridian of the place of observation. The ecliptic being divided from its interior to its exterior rim, the outer of the circles of longitude is set to the division corresponding to the longitude of the sun, as given in the solar tables,

and the whole is then turned round the poles of the equator until the plane of the ecliptic and the plane of the outer circle of longitude pass through the sun. The instrument is then adjusted, the inner circle of longitude and its sliding limb with sights is turned to the moon, and the angle read off upon this circle is the latitude of the moon, while the angle read off on the interior edge of the ecliptic is the longitude.

When stars are observed, it is sufficient to make the plane of the outer circle of longitude pass through the moon or any known star after setting that circle to the known longitude of the moon or star. The observation then takes place as before.

No material improvement upon this construction appears to have been made by the Arabs, who in some instances used very large instruments of the kind. A more skilful variety of the astrolabe is here shown, described by Tycho Brahé, from whose *Astronomiæ Instauratæ Mechanica* the preceding cut is taken.

The outermost circle represents the meridian; the axis passes through the poles, and there is a revolving equator and hour-circle fixed together. The sights on the circles are moveable; but instead of using opposite sights, the small cylinder which projects from the axis is employed. For example, to measure the declination of a star, the hour-circle is moved till it passes through the star, and a sight is then placed so that the star may be seen through it on the edge of the cylindrical pin which projects from the centre of the axis, both on looking above and below the cylinder, the orifice of the sight being made just large enough to admit of this. The angular distance of the sight from the equatorial circle is then the declination of the star. To measure the difference of right ascension of two stars, two observers take two sights on the equator, which they adjust till each sees his star just on the axis, both on one side of it and the other. The angular distance of the sights is then the difference of right ascension of the stars.

The plumb line shows whether the meridian is exactly vertical, and the screws at the feet are employed to raise or lower either end when necessary.

We give one more step between the ancient and modern instruments, from the same work of Tycho Brahé.

The hour-circle is now disengaged from the equator and independent of it. The polar axis is directly supported, and

not made to depend upon the position of the meridian. This is perhaps sufficiently near to the modern equatorial to be considered as the first instrument of the kind.

ASTROLOGY. If this word were used in a sense analogous with that of *geology* or *theology*, it would mean simply the *science of the stars*; while *astronomy* might mean the science of their order and arrangement. But the term, at least when coupled with the epithet *judicial*, has always signified the discovery of future events by means of the position of the heavenly bodies. The two words *astrology* (*ἀστρολογία*) and *astronomy* (*ἀστρονομία*) seem to have been used in the same sense by the Greeks, at least till about the Christian era. Cicero (*Offic.* i. 6.) uses the word *astrologia* to express astronomical knowledge.

It has long been unusual to produce any arguments against this pretended science; but there are two considerations which make us think it may be useful to show those who are unacquainted with it a few of its details. The first is, that works, seriously professing to inculcate and defend the principles of astrology, have been published within the last twenty years in this country, and are still sold, almost exclusively, by some booksellers: the second, that several of our most popular almanacs do actually give astrological predictions at the present time. This may be a mere matter of amusement with the more enlightened; but we are afraid there are some who play with edge-tools in reading the fooleries of the works alluded to. The love of the marvellous is not under proper regulation, even in the minds of many who do not go the length of supposing astrology credible; and we shall therefore perhaps do good service in showing what the system really is, and what consequences its adoption must lead to.

It must moreover be remembered that our old English writers, particularly the dramatists, cannot be well understood without some information upon the leading terms and principles of this art; which therefore may be as lawfully studied as the history of Jupiter and the *Metamorphoses* of Ovid.

The science which, under the name of astrology, or some term of equivalent meaning, found universal belief among all the nations of antiquity except the Greeks, and also prevailed through the whole world of the middle ages, is based upon the supposition that the heavenly bodies are the instruments by which the Creator regulates the course of events in this world, giving them different powers according to their different positions. This is the description of the more learned astrologers; for we need hardly say, that the ignorant have made the stars themselves the agents, just as the image of the Deity has generally come in time to be regarded by the vulgar as the Deity himself. Looking at the more credible description, it might be philosophical for a newly created being, in possession of rational powers, to suspend his opinion on such a point till he had observed facts enough to affirm or deny the connexion asserted to exist between the places of the planets and his own fortunes. That there is nothing repugnant to human nature in the basis of astrology is sufficiently proved by the number of great minds which have been led by it, when properly prepared by education; and the present age must recollect that the arguments which are now held conclusive against astrology get their strength in the minds of most people from no other circumstance than that which formerly was the prop of considerations which were held equally decisive in favour of it, namely, the bias of education. The real arguments against astrology are, first, that it is self-contradictory; secondly, that its predictions are not borne out by facts. To see the first of these, we must describe the leading principles of the art.

In the following globes, the circle projected horizontally represents the horizon, the double circle the meridian, and the other four circles are drawn at equal distances from the meridian and horizon, through the north and south points of the

latter, thus dividing the whole heavens, visible and invisible, into twelve equal parts. Let these circles remain immovable,

while the diurnal revolution of the globe takes place under them. The twelve divisions are called the twelve *houses* of heaven, and are numbered in the order in which they would rise, if the circles accompanied the diurnal revolution. Every heavenly body passes through the twelve houses in twenty-four hours, but is not always in the same house with the same stars, except at the equator. For it is evident that, in order to have two bodies always in the same house, the revolution must take place round the north and south poles of the heavens, which poles are in the horizon only to a spectator on the equator itself. The principal point attended to in each house is the part of the zodiac which occupies it; and the place of any planet in the house is the distance of the body from the cusp, or boundary circle, measured on the zodiac. The following fanciful method of representing the twelve houses was in universal use, and the readers of almanacs must be familiar with it.

The twelve triangles represent the twelve houses of heaven, as marked by the Roman numerals. The time is April 16, 1784, at half past six in the morning. On the boundary of each house is written the part of the ecliptic which is to be found on it. For instance, on the cusp of the twelfth house that is just rising is the point of the ecliptic which is in $4^{\circ} 14'$ of Gemini. The boundary between the ninth and tenth houses is in 1° of Aquarius. The whole sign of Scorpio is in the sixth house, the boundaries of which are therefore in Libra and Sagittarius. The planets are placed in their proper positions in the houses; thus Mercury (♂) appears to be in the twelfth house, at $22^{\circ} 45'$ from the boundary of the eleventh and twelfth.

But, on all the preceding points, it must be observed that great authorities differ very much. From among the obscurity and confusion which prevail in old treatises, we are able to collect this much, that some of them draw the boundary lines of the houses in such a way as to cut the ecliptic into twelve equal parts, instead of the prime vertical, as we have done; others draw the boundaries through the poles, instead of the north and south points of the horizon. The future destinies of mankind are rendered very uncertain by such diversity of opinion; but this we have found, that the followers of each system complain just as much of the rest, as if they had some reason to show for their own. For instance, Peletarius, or Pelletier, who introduced algebra into France, and wrote on the horoscope in 1563, expresses himself thus: 'Some cut the horizon into equal parts, some a vertical circle, some the equator, some the ecliptic, some a parallel: whence it is not wonderful that a difficult art should be involved in fresh obscurity; for who can possibly see a living likeness in a mirror which is put out of shape in so many ways?' His own system is the equal division of the zodiac; and his argument for it, independently of old authorities, is the incongruity of letting the poles of the ecliptic have nothing to do with a matter which so nearly concerns the zodiac. *Minimeque concernit, zodiaco suos polos esse inutiles in eo negotio quod zodiaci maxime proprium est.* The placing of the signs in the equator he treats as a dream, and seems perfectly satisfied with the preceding reason.

The houses have different powers. The strongest of all is the first, which contains the part of the heaven about to rise: this is called the *ascendant*; and the point of the ecliptic which is just rising is called the *horoscope*. The next house in power is the tenth, which is coming on the

meridian, &c. The first is the house of life, the second, of riches; the third, of brethren; the fourth, of parents; the fifth, of children; the sixth, of health; the seventh, of marriage; the eighth, of death; the ninth, of religion; the tenth, of dignities; the eleventh, of friends; the twelfth, of enemies. Each house has one of the heavenly bodies as its lord, who is stronger in his own house than in any other, as is but fit; and of two planets equally strong in other respects, he who is in the strongest house is the stronger. Now conceive all plants, animals, minerals, countries, &c., parcelled out under the different planets, which exercise their influence in abundance of different ways, according to the houses they may happen to be in for the time, and their positions relatively to each other—the result will be as good an idea of the mysteries of astrology as it is worth any body's while to obtain.

We shall now give some examples of the application of the science; and this we do principally, because in the mystical announcements which issue from our press, the darkness of the hints which are given throw a poetical gloom over the subject. This no doubt is interesting, and is not sporting too much with the credulity of the age, or with the chance of detection; but it is a foul libel on the powers of astrology. Thus, in 1815, instead of announcing some such prediction as the following—'Mars in the house of death portends, we are afraid, some new disasters, by war or other cause; a personage will strive against the new order of things, but, if we mistake not, the conjunction of Luna and Saturn in the twelfth house bodes him no good'—instead, we say, of such an unsatisfactory prophecy, a real believer in astrology—such as it was before it fell from its high estate—might have traced Napoleon from Elba to Waterloo; have calculated the very moment of the advance of the Prussians, and described the sword-knot of the captain of the Bellerophon. Thus we have the story of a Jew, in the time of the caliph Al Mansur, who was able to detect, by means of the heavenly bodies, that certain words just written upon a paper, which he was not allowed to see, were the names of a plant and an animal. But lest any one should imagine that perhaps the later astrologers have given up the attainment of information so minute, and have confined themselves to such general indications as those of our almanacs, which, as they mean nothing, may as reasonably be drawn from the stars as elsewhere, we take the following instances from a work published in 1817, which we will not name, and which we would willingly suppose to have been written in irony, if it were not that its size (two volumes quarto, with tables) and style are both evidences either of real belief, or intentional attempt to deceive.

A man who was born June 24, 1758, at eight minutes after ten in the morning, committed a murder, and was by many supposed to be insane. Pending his trial, an astrologer was requested to point out by the stars whether this defence would be established or not. The nativity was cast, that is, the position of the heavens at the aforesaid time was laid down, and the nativity having been rectified (a process amounting to giving the prophet a power of making almost any change he pleases), the result was as follows:—

'Mercury being lord of the ascendant, irradiated by a malefic quartile aspect of the planet Mars, and afflicted by an opposition with Jupiter, declares that the native shall be involved in an abyss of troubles and afflictions, even to the hazard of his life.'—'The quartile of Mercury and Mars, particularly when Mercury is constituted principal significator, hath implication of high crimes and misdemeanors.'—'Upon a further inspection of the figure, we find a baneful quartile aspect of Mars and Jupiter, with a mischievous opposition of Saturn and Mars. To the first of these we are to attribute the dissolute manners of the native.'—'Here is unquestionably a favourable trine of the Sun and Saturn; but no great good can result from it, because the Sun is lord of the twelfth house, posited in the tenth, and out of all his essential dignities: at the same time that Saturn is lord of the sixth, located therein, and both the significators are under the dominion of the *evil genii*, vitiating the mind and affections of the native.'—'At the time the unhappy native was prompted to commit this barbarous act, the Moon came to an opposition of Mars by direct direction, while she occupied the cusp of the seventh house, which represents the unfortunate woman.'—'The Sun I find to be giver of life, posited in the tenth house, the house of justice; Mercury, lord of the ascendant, being in Gemini, an *airy sign*, and the Moon likewise in an *airy sign*, show the manner of the

native's death, that *he would die suspended in the air*, while the opposition of four planets in the radix, and the mundane quartile of the Sun and Mars from the tenth, the house of justice, show the quality of it—namely, that it should be in due course of law, by the hands of the common hangman, and not by suicide.'—'I brought up the direction of death with great nicety and precision, and found he would be plunged into eternity when the Sun came to the anaretical point of the midheaven, and met the noxious beams of the Moon and Mars in opposition, which thus constituted is ever productive of a violent death.'

We now give the following opinion upon a case of a projected marriage, in which the lady, suspecting an attachment elsewhere on the part of her intended husband, inquires whether it will ever take place. The position of the heavens is supposed to be laid down at the moment of asking the question.

'The Sun is significator of the lady; and Saturn, lord of the seventh house, is significator of the gentleman. It must also be observed, that in this, and all questions relative to matrimony, Mars and the Sun are the natural significators of a woman's marriage; and Venus and the Moon are those of a man's. Now Saturn, the gentleman's significator, is remarkably well posited in the fifth house, and has Venus within his orb, applying to him by conjunction; which is a very powerful indication that his affections are sincere and honourable, and that his mind is fully bent to the marriage state. The Sun, likewise, being in a sextile aspect with Mars, the lady's significator of marriage, plainly shows her inclination to matrimony to be strongly fixed, and her affections to be perfectly sincere.'

'The next thing to be considered is, whether there be any frustration or impeding aspect between these significators, and I find the Moon and Venus, the gentleman's significators of marriage, are applying to a quartile aspect with each other. This is an evident proof that the marriage is prolonged by the interference of some other woman of this gentleman's intimate acquaintance, because the aspect is made in a feminine sign; but as the Moon, in separating from Venus, applies to a perfect trine with Mars, the querent's principal significator of marriage, and also to a sextile of the sun, her natural significator in the figure, it totally removes the evil effects of the malefic aspect, and leaves the path free and unobstructed to the gates of Hymen. This opinion is greatly strengthened by considering the mode in which their significators are severally disposed. Saturn disposes of the Sun, who is posited in the terms of Venus and Venus, Saturn, and the Moon, are all disposed of by the benevolent planet Jupiter, who is himself disposed of by Mars, the principal significator of this lady's marriage, and who thus triumphs over every obstacle to the celebration of their nuptials. I therefore could not hesitate in declaring to the lady, in the fullest and most satisfactory terms, that the gentleman who courted her had a sincere and tender regard for her; and that, though some circumstances might have happened rather unfavourable to her wishes, yet she might rest perfectly assured that he was the man allotted to be her husband.'

'Apparently well satisfied with these declarations, she proceeded to inquire in what length of time this desirable circumstance might come to pass. To gratify her wishes in this particular, I referred again to the figure, where the Moon wants upwards of eleven degrees of forming a perfect sextile aspect with the Sun, the lord of the ascendant, and the same to Mars, her significator of marriage, and therefore, by converting the degrees into time by the rule heretofore given, I fixed her marriage at about the end of three months, assuring her it could not exceed that time.'

On looking at the examples we have chosen, we see that they refer to matters which are proverbially under the control of destiny; we therefore take another, which has more connexion with the common affairs of life. It consists of directions for dealing in the smaller sorts of cattle, such as sheep, hogs, &c., and will fully explain the risk of such speculations.

'If the lord of the sixth and the lord of the second are in conjunction, in a good house of heaven, the querent may thrive by them' (i.e. small cattle); or if they be in sextile or trine, the same. The lord of the sixth, casting a friendly aspect to the part of Fortune, or being in good configuration with the disposer thereof, denotes much good to the querent by dealing in small cattle; but if, on the contrary, the lord of the sixth be unfortunate, and in evil aspect with the lord of

the ascendant or second, or cast malignant rays to either of their cusps, the querent will lose by dealing in small cattle. If the lord of the sixth be in quartile, or in opposition to the disposer of the part of Fortune, or the Moon, the querent cannot thrive by dealing in small cattle. The same if the lord of the sixth be afflicted either by Saturn, Mars, or the Dragon's Tail; or be found either retrograde, combust, cadent, or peregrine. The Dragon's Tail and Mars show much loss therein by knaves and thieves, and ill bargains, &c.; and Saturn denotes much damage by the rot or murrain.

That the antient system of astrology contained the most contradictory assertions may be made evident in very few words. The position of the heavens at the time of birth settled every man's character of body and mind, the various fortunes he would meet with, and his relative positions with regard to friends and enemies. Thus, every one who was born at or very near the same time as Alexander the Great, in the same country, would have a right to expect a somewhat similar career; and twin brothers could never fail to have the same horoscope, and therefore the same success in life; and though the subject of a particular horoscope should travel over the whole world, and thereby come under the influence of positions of the heavens which never could have occurred at his birthplace, yet these would be always ready to tell him (when properly looked at) whether the present moment was favourable or unfavourable to any pursuit he had in view. To take a case that might have occurred: suppose two men had engaged to throw dice against each other for their whole fortunes, and that each went the night before to consult different astrologers in the same town. To them it would not be necessary to tell their names, or exhibit their horoscopes; the present position of the heavens would be sufficient for pointing out a favourable hour, and if both astrologers worked by the same rules, as they ought to do, they would both arrive at the same result: that is, the same would be recommended to both inquirers, though one of them must certainly lose.

The astrologers never made any allowance for the precession of the equinoxes. Thus, though the constellation Aries is now in the sign Taurus, and the influences of its stars ought to have moved with them, we find that the astronomical Aries, or the first thirty degrees of the ecliptic, is used for the constellation. Under the circumstances, this is of little consequence; but such a practice would be fatal to astronomy.

That observed facts did stubbornly refuse to fulfil the predictions of the planets need hardly be told. In the fifteenth century, Stœffler foretold a universal deluge which should take place in 1524, in consequence of three planets being then in conjunction in a watery sign. All Europe was in consternation; and those who could find the means built boats in readiness. Voltaire mentions a doctor of Toulouse who made an ark for himself and his friends. Such a circumstance shows the hold which astrology had upon men's minds, from which, had it been true, it never could have been forced; for though a new truth, even when capable of easy verification, is introduced with difficulty, it is altogether absurd to suppose that a science, the correctness of which was of every-day experience, should drop and become exploded, not for want of cultivators, but of believers. The former we have, perhaps, even now, and a few of the latter, though only among the most ignorant of the community. The art is, at present, under the ban of the law, in order that designing persons may have at least one access stopped to the pockets of the credulous. By the statute of the first of James I. c. 12, sorcery of all species was prohibited, though it does not appear certain that this term included astrology; but by the vagrant act, 5 Geo. IV. c. 8, sec. 4, all 'persons pretending to tell fortunes, or using any subtle craft, means, or device, by palmistry or otherwise, to deceive and impose upon any of his Majesty's subjects,' are rogues and vagabonds—that is, punishable by any magistrate, with three months' imprisonment and hard labour.

The history of judicial astrology, at least up to the middle of the fifteenth century, is very nearly that of astronomy, since the latter branch of the science, except among the Greeks, was mostly cultivated for the sake of the former. Hence to it, as to alchemy, we owe many really useful discoveries. It is a singular fact, that the first lunar tables which were constructed on the Newtonian theory were intended to be subservient to the calculation of nativi-

ties; there is no question that the necessity which the astrologer lay under, of being ready, at any moment, to lay down the positions of the heavenly bodies, produced great numbers of useful tables and observations. and the Greek works which have been preserved by the Arabs were valued principally for the use to which their mathematics could be turned in astrology. The origin of the science is beyond the reach of history, nor is it much worth while to collect all that is known on this point. It certainly came into Europe from the East, where it is mentioned in the earliest records of every nation. The Chinese are said to have placed it on the same footing with agriculture and medicine; the Chaldeans cultivated it sedulously, and the invention is attributed to them by Suidas (cited by Montucla, iv. 372). The Hindoos have long regulated the most important actions of their lives by the stars (see introduction to the *Likwati*); but Mr. Colebrooke has shown (*Hindoo Algebra*, preface, p. 80) that several of their fundamental terms are not Sanscrit, from which he apparently leaves us to conclude that he thinks the science neither antient nor indigenous in India. Among the Egyptians, it was of great antiquity; but it is not mentioned in the books of Moses, unless included in magic or sorcery, which is most probable. The books of Isaiah and Jeremiah allude directly to it in several places, as also that of Daniel. During the captivity, the Jews appear to have learnt the art, and from that time probably, but certainly in the earlier centuries of the Christian æra, became much addicted to it. Several of the more celebrated writers on astrology under the caliphs were Jews, as Messahalab, Moses ben Maimon, Solomon Iarchus, whose almanacs we have mentioned as among the earliest published, and many others.

In Greece, at least during the classical ages, judicial astrology found no reception; nor do we trace any marks of it even in the earlier astronomical writers of that country. The system was little in harmony with the allegorical mythology which prevailed there; and the oracles afforded perhaps sufficient nourishment to the appetite for the marvellous. But among the Romans, astrology was cultivated with avidity from the time of the conquest of Egypt, in spite of several edicts of the senate. In the second century, the whole world was astrological; and even Ptolemy was infected. There is a work entitled 'Tetrabiblos' attributed to him, which is entirely devoted to astrology; and though its genuineness has been doubted by some, merely because it is astrological, there appears no sufficient reason to reject it. (See Delambre, *Hist. Ast. Anc.*, ii. p. 543.)

All the followers of Mohammed are and have been astrologers. The predestinarian doctrines of their system render the transition easy and natural; for, as we have seen, the science of astrology is based upon the notion of the necessity of human actions. The establishment of the Moors in Spain, and the crusades, caused the introduction or the increased cultivation of the art among the descendants of the barbarians who destroyed the Roman empire; probably the former, for we have no distinct traces either of astronomy or astrology among the northern nations. But the predestinarian principle assumed a modified form, more consistent with the belief of the Catholic church. It was said that the stars only incline, but cannot compel; which position, while it left the will free, was a most convenient explanation of any failure in the predictions. The Greek and Roman Christians of the earlier centuries had in many instances received the whole of astrology; in others the modified belief above mentioned. Origen, though he recognises the stars as rational beings, yet, in his *Philocalia*, contends that the stars neither incline nor compel, but only prophesy or point out what men will do without exerting any influence. He then gives a long and curious argument against their compelling power, without explaining how it does not hold equally against their predicting faculty. St. Augustin (cited by Vossius) argues against astrology altogether. The church, in its public capacity, condemned the art in the first councils of Braga and Toledo, and in the Decretals (cited by Vossius). The doctrine of astrology was among the errors imputed to the Priscillianists. But many zealous catholics in later times adopted the same opinions, and among them churchmen of the highest rank, such as the Cardinal d'Ailly (died in 1425), who calculated the horoscope of Jesus Christ. The astrology of comets, which is hardly yet out of date, has even been recognized by a Pope: in the fifteenth century Calixtus III. directed prayers and anathemas against a comet

which had either assisted in or predicted the success of the Turks against the Christians.

The establishment of the Copernican system was the death of astrology; and that upon an argument not one bit stronger against it than preceding systems for it. When it was found that the earth was only one among other planets, it soon came to be reckoned absurd by many that our little globe should be of such consequence as to be the peculiar care of the whole system. But why should the principle of non-interference have been preferred to that of the balance of power? We have lost a charming opportunity of discovering what goes on in other planets.

The last of the astrologers was Morin, best known as the opponent of Gassendi. The latter had in his youth studied and believed in the art, but had afterwards renounced and written against it. The former, who worked for thirty years at a book on astrology, and was besides an opponent of the motion of the earth, predicted his opponent's death repeatedly, but was always wrong. He also foretold the death of Louis XIII., with no better success. Since his death, which took place in 1666, the science has gradually sunk, and we believe has in no case been adopted by any real astronomer.

ASTRONOMY signifies the *laws of the stars*, and is applied generally to all that relates to the motions and theory of the heavenly bodies, as well as of the earth. If we except general terms, such as *science*, there is perhaps no single word which implies so many and different employments of the human intellect. We shall therefore confine ourselves here to a slight sketch of the annals of the science, and a few general considerations, pointing out at the same time the articles which should be consulted for further details.

The work of the astronomer begins in the observatory, where means are provided for noting the positions of the stars. Of the instruments by which this is done, see the principle and details in the articles INSTRUMENTS (ASTRONOMICAL), CLOCK, PENDULUM, OBSERVATORY. There are two classes of observations: the first, of known bodies, of which the places are so nearly determined that no question remains except about quantities less than a second of time, or its corresponding quantity, fifteen seconds of space [see ANGLE]; and for this class the consideration what phenomena shall be observed is made to rest entirely upon the instruments, those phenomena being preferred, for the observation of which the steadiest instruments can be made. These move only in the meridian, and the star is waited for. The second class of observations, such as those of comets, double stars, and all mere appearances, which require an instrument that can be pointed to any part of the heavens, or can be made to follow a star, is performed by telescopes, which are made to revolve with the heavens. [See EQUATORIAL.]

The second division of astronomical labour is the department of the mathematician only. The observations as they come from the instruments are subject to all the errors of the latter; and no perfect instruments can be constructed. The best circle that can be made is slightly oval; the best pivot that can be turned will not be truly cylindrical. The question now comes, in what manner to compare different species or sets of observations, so that the discordances themselves shall point out the quantity and quality of the instrumental errors; and how from thence to derive the corrections necessary for future observations. Also, how to choose the time and manner of observation, so that any particular error, whether of instruments or theory, shall be least, if the observer be desirous of avoiding it, or greatest, if he wish to detect and measure it. Every-day experience shows that there is no better test of the progress of observation than the discovery of new instrumental errors, provided only the quantities in question become less and less. The angular error which now sets an observer to work to correct his result is less than the six-hundredth part of that which would have been sufficient to annoy Ptolemy or Hipparchus. And in speaking of an instrument, we may consider the observer himself as a most material part, on the combined power of whose eye, ear, and judgment, the correctness of the observation depends. It is hardly to be expected that, even under precisely the same circumstances, two observers should note the same phenomenon so as to agree within a small fraction of a second; and recent experiments on phenomena noted with both the eye and hand, have demonstrated the existence of small differences between different

observers, attributable only to their different habits of perception or physical constitution. On this point see EQUATION (PERSONAL).

When observations have been, as nearly as possible, freed from instrumental errors, the next step would be, if we could imagine a system of astronomy only in its infancy, with instruments as near perfection as our own, to deduce, by combination of mathematical reasoning and calculation, the real places of the stars for some one moment, and the magnitudes and laws of the various motions to which they are subject, whether periodical or permanent, and whether arising out of the motion of the earth or out of a proper motion of the stars themselves; and for the solar system, to determine the relative motions and positions of the planets and their satellites, which can only be done by the previous measurement of the earth and subsequent comparison of the results of one observatory with those of another. But these primitive determinations have always been in progress with the instruments, and results have increased in accuracy with the power of observing; so that instead of working afresh for the determination of *elements*, as they are called, almost the whole of modern astronomy is a process of correction of those which have been previously obtained. This greatly facilitates operations: for the reason of which see DIFFERENTIAL CALCULUS, APPROXIMATION. The measurement of the earth itself, and the determination of its figure, which is the basis of planetary astronomy, so far as ascertaining the actual dimensions of our system is concerned, will be treated as a separate science under the name of GEODESY, though it is a constituent part of astronomy, both as to the methods by which it is carried on, and the objects for which it is undertaken.

The third department of astronomy, being that which requires the most extended knowledge of mathematics, and the highest exercise of thought, is that which goes under the name of *physical astronomy*, and consists in the combination of the various phenomena as actually observed, in order to find out what are their physical causes, and according to what laws those causes act. It is evident, that without some success in this branch of the science, there can be no power of *prediction*, except what arises from the presumption that preceding phenomena have run their whole possible round, so that nothing *can* happen except a repetition of what *has* happened. To a rough view this seems to be the case, and is so in a great measure; but to the instruments of an observatory there appears no such complete *periodicity*. To this head we should refer such questions as those of REFRACTION, ABERRATION, and GRAVITATION. The term physical astronomy is usually applied to investigations connected with the latter only; but both etymology and analogy warrant its extension to the former. Under this, also, we must place all questions connected with the physical constitution of the various planets, so far as that can become known. Of the great increase which the predicting power of astronomy has received since Newton deduced the motions of our system from the simple law of attraction, there is no need to speak; but we shall notice one peculiar use of that principle, by which the results of observation are anticipated, and the first and second of our divisions of astronomy advanced, while at the same time the *experimentum crucis* of the truth of the principle is furnished. There are many small inequalities of the solar system, which, though not likely to show themselves, mixed up as they are with so many others, are yet certain to be found, if looked for at the time when their effects are most sensible. The results of theory point out that a certain inequality, whose law and approximate magnitude it gives, should be found in the motion of a certain body, if the Newtonian principle be correct. On being looked for in the manner which the nature of the inequality itself shows to be most advantageous, it is found accordingly, and its *exact* magnitude, as ascertained by observation, is often of use in correcting that obtained from theory. For example, had it not been for methods of this kind, our knowledge of the motions of Jupiter's satellites, which is yet far from mature, would have been in a state of the merest infancy.

If the theory had arrived at a degree of completeness, towards which it has been and is rapidly tending, nothing more would be necessary for the determination of the motions of the solar system than the knowledge of the actual positions, velocities, and directions of the velocities of the bodies composing it, at some one moment, or of any

other quantities in which the above were mixed up, and from which they could be obtained by calculation. But up to the present time it has been necessary to use more *data* of observation than the preceding, and it is only within the last ten years that tables of the moon, from the first-mentioned *data* alone, have been published by Baron Damoiseau, to which we shall afterwards refer. These tables differ from the mixed tables hitherto used by about half a second of time in right ascension, and two seconds of space in declination. (This is the mean comparison of the tables of Damoiseau and Burckhardt for January, 1834, and may be deduced from the more extensive comparison given in the *Nautical Almanac* for 1835.) But the tables themselves in common use differ from actual observation by quantities of about the same (or rather greater) magnitude, and it has not yet been ascertained which of the two sets of tables are more correct. But we have no doubt that the Cambridge observatory will decide this question in the course of the present year.

For the details of the actual state of astronomy we must refer the reader to such articles as STARS, SOLAR SYSTEM, &c., and the names of the several planets. We shall now proceed to a sketch of the history, or rather the *annals*, of astronomy, referring for fuller information either to the *History of Astronomy*, published by the Society, or to the complete and magnificent works of Delambre on the subject. The latter we have followed in great measure as to disputed questions of fact; and the form in which this work is written will render verification easy in any personal matter, though chronological reference is rather difficult.

The real history of *written* astronomy, that is, of actually recorded and moderately correct observations, in sufficient number to constitute a body of science, commences with Hipparchus, about 160 years before our æra. Prior to his time, it is difficult to do more than speculate upon the few facts which are left to us. That astronomical observation of a certain description began in the very earliest ages, there can be no doubt; but here there could be but one instrument, the horizon, and but one theory, the actual motion of the heavenly bodies round the earth. The earliest observations mentioned are those of the rising and setting of stars, which led to the registration of the different appearances presented by the heavens in the course of a year, to which may be added lunar and solar eclipses, and comets. The rapid motion of the moon in the heavens would probably have caused the lunar zodiac to be first marked out, though it is clear that the solar zodiac was of a very early date. Astronomical observation has always been one of the accompaniments of civilization, both in modern and antient times; and however much we may conceive ourselves entitled to look down upon the notions of our predecessors, we must not forget that in speaking of any country which possessed an astronomical theory worth so much as laughing at in modern times, we place that country in the list of exceptions to the rule which prevailed through the greater number. If the Chaldean system appear insufficient, or the Ptolemaic complicated, these are yet real results of thought, and, to a certain extent, actual representations of fact. Mungo Park mentions an African tribe, whose opinion it was that the inhabitants of the west fried the sun when he got down to them, and after heating him sufficiently for next day's service, took him round by a private passage to the east. If we could collect the astronomy of the whole antient world, there can be little doubt that the comparatively humble efforts to which we are coming would appear miracles of sense and reflection, among theories not much superior to those of Park's Africans.

The nations who are known to have cultivated astronomy before the Christian æra are the Chinese, Indians, Chaldeans, Egyptians, and Greeks. The first made it a matter of politics, the three next of religious observance, and all four applied it to astrology. Among the Greeks only, the science had no reference either to politics, religion, or soothsaying; and here it throve with a vigour which permits us to make the astronomy of Hipparchus and Ptolemy a part of the chain which ends with Newton and Laplace. What we know of the four first-mentioned nations is not sufficiently certain or definite to warrant our drawing very positive conclusions as to the time when they began to study the science; and the question is rendered the more difficult by the pretensions to antiquity which have been advanced in favour of each by well-informed men of modern times. Each nation has its advocates, who maintain that the Chinese, the Indians,

the Chaldeans, or the Egyptians, were the first astronomers: which is of itself sufficient to prove that the question is doubtful. Fortunately it is of little consequence; and also the astronomy of the first and two last is of a character and extent which will justify our saying that, be it very antient or not, there is nothing on the face of it which needs the supposition of any very long time having been expended upon it. The Hindoo astronomy, on the other hand, though certainly more extensive and correct, may have been, for anything that can be shown to the contrary, received from the Arabs of the middle ages. At least such is the opinion of Laplace, Delambre, and several celebrated Anglo-Indians, who have had means of knowing more of the subject than either. But this question is one of difficulty, and ought not to be considered as finally settled.

The Chinese have some annals which were translated by De Mailla, a Jesuit missionary at Pekin, 1777-1785. They claim to go back to the year B.C. 2857, but of astronomical phenomena they record hardly anything, except eclipses of the sun, and the appearance of comets, and of the former nothing but the fact and the day of their happening. They state that the astronomers by profession were obliged, on pain of death, to predict every eclipse that occurred, and that, even after such phenomena were found capable of prediction, it was the practice to shout, beat drums, &c., during every eclipse, to frighten away the monster which they supposed to be devouring the sun. The mathematicians, in spite of their responsibility, were forbidden to make any alteration in their theories or methods, without the consent of the emperor. The loss of many methods, asserted to have been formerly practised, is attributed to the burning of all scientific books by one of their princes, B.C. 221. But perhaps the loss was not great; for Gaubil, who recalculated their asserted eclipses, could not verify more than one of a date anterior to the time of Ptolemy; and even that one is doubtful. The fact of the motions of the planets was known to the Chinese, but not the precession of the equinoxes, till about A.D. 400. They had also the Metonic and Calippe periods. For the account of the more modern Chinese astronomy, we must refer to the article CHINA; the improvements which were gradually introduced in the earlier ages of the Christian era might have been, and probably were, the work of Europeans.

The question with regard to the Hindoos is not whether their astronomy is sufficiently high in its pretensions to make it worth while to enquire into its antiquity, but whether an astronomical system of a very advanced character, which certainly was found among them, is or is not as old as they assert it to be. This system is found in certain tables which have been brought into Europe by Legentil [see TIRVALORE, TABLES OF], and in an original work [see SURHYA SIDDHANTA]; and it may be fairly considered as about equal to the European system of the twelfth century. The epoch claimed by the tables is B.C. 3102, the beginning of the Cali-yug, or iron age of Hindoo mythology, at which time a conjunction of all the planets is asserted. But this has too figurative a character; and moreover, the elements of the tables are hardly such as would have been derived from observations actually made at that period. That the epoch is fictitious may be readily believed: but the question is, was this fictitious epoch formed by Hindoos from their own observations before the Christian æra, or was their system introduced by the Arabs, or by direct communication with the Greeks? On the one hand it is argued that the Indian tables, being in many respects a mean between those of Ptolemy and Albategnius, may have been derived from those two; on the other hand, the remarkable correctness of several points, and the known character of the people in question, whose advances in mathematics cannot be doubted, and whose habits have, throughout recorded history, induced them to repel all connexion with foreigners, are urged in favour of the originality of their system. Those who are curious may consult Bailly's *Hist. de L'Astronomie Indienne*, on the one hand, or Delambre, on the other; but this question has unfortunately been treated with considerable spirit of system on both sides.

The Chaldeans, according to Diodorus, had long observed the risings and settings of the heavenly bodies, as well as eclipses. They had the celebrated Metonic period of nineteen years, and it is supposed that Meton obtained it from them, though this point is doubtful. They had also other periods, the meaning of which has caused discussion. [See SAROS, NEROS.] Simplicius, a commentator on Aristotle

relates that a series of eclipses preserved at Babylon was transmitted by Alexander to Aristotle, and contained the observations of 1903 years preceding the conquest of Babylon by the Macedonians. But Ptolemy gives only a few of them, the earliest of these not reaching higher than B.C. 720. They are of the roughest kind, the times being given only in hours, and the part of the diameter eclipsed within a quarter; but nevertheless they are the earliest trustworthy observations we possess, and led, in the hands of Halley, to the discovery of the acceleration of the moon's mean motion. We find also among the Chaldeans the use of the clepsydra as a clock, of the gnomon as an instrument for measuring solstices, and of the hemispherical dial called by the Greeks *σφαρη*, for ascertaining the positions of the sun. By the clepsydra they were enabled to divide the ecliptic nearly into twelve equal parts, and are thus said to have invented the zodiac. [See BEROSUS, CHALDEA.]

The Egyptians have left us no observations, and few astronomical relics the meaning of which can be made very clear, though it is probable that they were the first instructors of the Greeks. Their year was of 365 days: for their method of correcting it, see SOTHIAIC PERIOD. They observed eclipses, but none have come to us; they foretold comets, according to Diodorus; but as this author also mentions at the same time that they foretold future events, it becomes doubtful whether we are to understand that their predictions were successful. The idea attributed to them that Mercury and Venus moved round the sun is not mentioned by Ptolemy; whose silence on this and many other points, writing as he did in Egypt, is remarkable, unless it be admitted at once as a proof of exaggeration in the preceding accounts. The correct manner in which some of the pyramids are said to be placed north and south has always been quoted as a ground of suspicion, that these buildings had some astronomical use. The zodiac has also been attributed to the Egyptians. [See DENDERAH, ZODIAC OR.] The only attempt at a measure which we have remaining is one of the diameter of the sun, the meaning of which is obscure; but if what Delambre mentions (without citing his authority) be true, that they measured time by the *distance run by a horse*, as well as by the clepsydra, we need not be surprised that Ptolemy found no assistance from their ancient observations. The story of Thales teaching the Egyptians how to find the height of the pyramids by the shadow, and that in Herodotus, of his being told by them that the sun had twice risen in the west, are, so far as their credit goes, confirmations of the opinion generally formed of Egyptian astronomy. [See MANETHO, EGYPT.]

With regard to the astronomy of the Greeks previously to the earliest extant works, there is little to be said. The Ionian school, founded by Thales B.C. 600, followed in succession by Anaximander, Anaximenes, and Anaxagoras [see all these names], added little or nothing to practical astronomy. If Thales announced the eclipse of B.C. 610 [see ALYATRES], it was the year only; and the opinion of the earth's motion, attributed to Anaximander (whom see), rests on slender foundation. The school of Croton, founded by Pythagoras (whom see) about B.C. 500, and sustained by Philolaus, produced no observers, though it certainly adopted the opinion of the earth's motion. Meton, B.C. 432, introduced the cycle of nineteen years; Calippus, B.C. 330, introduced the improvement on the former known by his name. Eudoxus of Cnidos, B.C. 370, brought into Greece, according to Pliny, the year of 365½ days, and wrote some works, one of which exists in the poetical version of Aratus. Timocharis and Aristyllus, B.C. 300 (?) made the observations which afterwards enabled Hipparchus to discover the precession. Pytheas, about the time of Alexander, measured the latitude of Marseilles with tolerable accuracy. The work of Aristotle on astronomy is lost; and what is still more to be regretted, that of his disciple Eudemos on the history of astronomy. The poem on the Sphere attributed to Empedocles, B.C. 450, is probably much more modern.

We now come to the period of history, and of the Alexandrian school. This article being for reference only, we shall condense as much as possible the principal discoveries of the succeeding astronomers, in order of time. This could not be done in the chain of surmises mixed with history which we have just finished, since it is important to avoid confounding what is known with what is only supposed. For further information refer to the name at the beginning of each paragraph.

Autolycus, B.C. 300. His books are the earliest which are extant in the Greek language on astronomy. They are two—1. On the sphere in motion. 2. On the rising and setting of the stars. He appears to have considered the year as exactly 365 days.

Euclid of Alexandria, B.C. 300. The *Elements* of Euclid show that the Greeks of his time had no trigonometry. There is another work attributed to him, entitled *Phenomena*, which is no more than a treatise on the doctrine of the sphere.

Aratus of Cilicia, B.C. 281, has left an astronomical poem, chiefly taken from Eudoxus, and valuable on account of the commentary of Hipparchus.

Aristarchus of Samos, B.C. 280. His work on the magnitudes and distances of the sun and moon is the first attempt to measure the relative distances of these two bodies, by observing their angular distance at the time of half moon. To him also is attributed the opinion that the earth revolves round the sun.

Manetho the Egyptian, B.C. 260. His history is lost, but a poem attributed to him remains. It is a description of the heavens, filled with astrology, and containing no observations.

Eratostrhenes of Cyrene, B.C. 240, is said to have observed with some celebrated astrolabes which he erected at Alexandria, which remained standing till the time of Ptolemy. Various works are attributed to him, for which see his life. He observed (either with a gnomon or with a meridian circle) [see ASTROLABE] the obliquity of the ecliptic, and the latitude of Alexandria; and from the latter, and the fact that at Syene the sun was vertical at the summer solstice, he deduced an approximation to the earth's magnitude. His approximation makes a degree to be 700 stadia. A catalogue of stars attributed to him (the oldest extant) is probably spurious, but shows that, in and about his time, the method of referring stars to their latitudes and longitudes was not practised. His value of the obliquity of the ecliptic—11 parts out of 166 of the whole circumference—was adopted by Hipparchus and Ptolemy.

Archimedes of Syracuse died B.C. 212. He observed solstices, and attempted to measure the sun's diameter. His writings show that trigonometry was as yet unknown.

Hipparchus (of Bithynia?), B.C. 160-125, the greatest of all the Greeks in astronomy. In his youth he wrote a commentary on Aratus. [See ARATUS.] He discovered the precession of the equinoxes, by comparing his own observations with those of Aristyllus and Timocharis, or others of his predecessors. He was the first who employed processes analogous to those of plane and spherical trigonometry, for which he constructed a table of chords. He first used right ascensions and declinations, which he afterwards abandoned in favour of latitudes and longitudes. He suggested the method of referring terrestrial positions to latitude and longitude, and was probably the inventor of the stereographic projection. He determined the mean motion of the sun and of its apogee, the inequality of the sun's motion, and the length of the year, to greater exactness than his predecessors. He found the mean motion of the moon, of her nodes, and of her apogee; her parallax, eccentricity, the equation of her centre, and inclination of her orbit. His observations also led him to suspect another inequality in the moon's motion, which Ptolemy afterwards discovered (the evection). He calculated eclipses, and used the results in the improvement of the *Elements*. He made one of the first steps towards a correct representation of phenomena, by supposing the sun to move round the earth in a circle, the earth not being at the centre. His catalogue of the longitudes and latitudes of 1081 stars was the first at all worthy of the name. If Hipparchus had possessed the pendulum and the telescope, fifty years might have enabled his successors to place astronomy in the state in which it stood at the birth of Newton. Considering his means, his observations are perhaps unequalled.

After the death of Hipparchus there is no astronomer of eminence till Ptolemy. Between them we have

Hypsicles of Alexandria, B.C. 146, wrote the 14th and 15th books of the *Elements* of Euclid, which contain some astronomical propositions.

Geminus (of Rhodes?) B.C. 70, wrote an introduction to the heavenly phenomena, containing no new discovery. It would seem he was not an observer.

Posidonius about the same time attempted to verify the measure of the earth of Eratosthenes. His writings are all

lost, but many of his opinions are preserved in Cleomedes and Strabo. He remarked (though probably he was not the first who did so) the connexion of high water with the southing of the moon.

Theodosius of Bithynia, B.C. 50, left a work on spherical geometry, another on climates, and a third on the phenomena of day and night.

Sostigenes of Alexandria, B.C. 50, corrected the calendar under Julius Cæsar.

Hyginus left an astronomical description of the heavens.

Manilius, a Roman, A.D. 10, wrote an astronomical and astrological poem.

Seneca, A.D. 50. His book on natural philosophy contains many pieces of information on astronomical history, but is principally remarkable for his bold opinions on the nature of comets. These he declares to be planets, whose laws he predicted would one day be calculated, and that posterity would wonder how things so simple could have so long escaped notice.

Menelaus, A.D. 80, has left three books of spherical trigonometry.

Theon of Smyrna, A.D. 117? wrote on astronomy, and made a collection of astronomical works. His observations are cited by Ptolemy.

Cleomedes wrote on astronomy. He certainly lived after Posidonius, but whether before or after Ptolemy is uncertain. He is usually considered as having lived under Augustus Cæsar.

We must suppose that there were many real observers between the epochs of Hipparchus and Ptolemy; but from the loss of even their names, and the silence of Ptolemy himself, it is clear that no discovery of any importance was made.

Ptolemy of Alexandria, A.D. 130—150. We must briefly mention his works, his system, and his discoveries. The *μαθηματικὴ σύνταξις*, or *mathematical collection*, afterwards called *μεγάλη σύνταξις*, and, by the Arabs, the *Almagest* [see *ALMAGEST*, *SYNTAXIS*], is the work from which we derive most of our knowledge of the Greek astronomy. We find there a full account of the observations and discoveries of Hipparchus; those of Ptolemy himself; the reasons and elements of his system; various mechanical arguments against the motion of the earth, which show that the first principles of dynamics were utterly unknown; a description of the heavens and the milky way, and a catalogue of stars, which we may be nearly certain was that of Hipparchus, reduced to his own time by an assumed value for the precession, but which has been asserted to have been corrected by new observations; a theory of the planetary motions; the length of the year; the instruments he employed, &c.

The Ptolemaic system [for more detail of which see *PTOLEMAIC SYSTEM*] was an attempt to represent the motions of the planets by supposing them to move uniformly in circles, the centres of which circles themselves moved uniformly in circles round the earth. The angular motions of the planets, as then known, were sufficiently well represented by this system; not so their changes of distance from the earth, as seen in their apparent diameters. This was the universal system of after-times till Copernicus.

The principal discovery of Ptolemy is that of the *LUNAR ELECTION* (which see), an inequality such as would be caused by an alternate increase and diminution of the excentricity of the moon's orbit. He also discovered the *REFRACTION* (which see), and made some tolerably correct experiments to determine its law. He explained the apparent enlargement of the discs of the sun and moon when near the horizon. He extended the projection of the sphere of Hipparchus. He entered into the investigation of every point which Hipparchus had touched; in some instances finding more correct values; in others, altering without amending. He was not an astronomer only, but wrote on geography music, chronology, mechanics, and, unfortunately, on astrology. [See *PTOLEMY*.]

With Ptolemy the originality of the Greek school ends. We must come to the Arabs before we find anything worth particular notice.

Sextus Empiricus, A.D. 173, described and wrote against the Chaldean astrology.

Censorinus, A.D. 238, wrote an astrological work on the day of nativity, containing historical information with regard to astronomy.

Julius Firmicus Maternus, A.D. 370, wrote on astronomy,

Pappus of Alexandria, A.D. 383. His commentary on Ptolemy is nearly all lost.

Theon of Alexandria, A.D. 385, the most celebrated commentator on Ptolemy. He was a good mathematician, but no great astronomer. He has however left some tables, and a method of constructing almanacs.

Hypatia (his daughter), murdered A.D. 415, the first female on record celebrated for her scientific talents. She wrote one book of her father's commentary, and constructed some tables.

Martianus Capella, A.D. 470, in his *Satyricon*, has some astronomical notions, among which is the following: that Mercury and Venus move round the sun. Cicero and Macrobius give the same idea; but the passage of Martianus is remarkable as being reported to have turned the attention of Copernicus to the system which bears his name.

Thius of Athens, A.D. 500, has left six observations of lunar occultations and solstices: the only observations recorded between Ptolemy and the Arabs.

Simplicius, A.D. 546, has left a commentary on, and description of, the astronomical work of Aristotle, which we have mentioned as lost.

Proclus Diadochus (not the commentator of Euclid), A.D. 550, wrote a commentary on the astrology of Aristotle, and a description of astronomical phenomena.

Isidore, archbishop of Hispalis (Seville), A.D. 636, wrote a theological work on astronomy.

Bede, A.D. 720, and *Barlaam* the monk, A.D. 1330, are attached to the preceding by Delambre. Both wrote astronomical works of little distinct merit. The last Greek writer on astronomy, of the least note, is *Michel Psellus*, A.D. 1050.

It is remarkable that, excepting his own commentators, few of the authors immediately preceding ever quote Ptolemy. Had it not been for the Arabs, the writings of the latter must have been lost.

The Alexandrian school was destroyed by the Saracens under Omar, A.D. 640; and the rise of astronomy among the eastern Saracens dates from the building of Bâedâ by the caliph Al Mansur, in the year 762. In the reign of this prince, translations of the Greek writers were begun; and with nearly the same instruments, and the same theory, as Ptolemy, a career of four centuries of observation commenced, during which many astronomical elements, and, in particular, the obliquity of the ecliptic, and the precession of the equinoxes, were more accurately determined.

In the reign of Al Mamun, son of Harun al Rashid, himself a diligent observer, great encouragement was given to astronomy. A degree of the meridian was measured, but with what accuracy cannot be known, from our ignorance of the measure employed.

Albategnius, or *Al-Batani*, A.D. 880, discovered the motion of the solar apogee, corrected the value of the precession, the solar excentricity, and the obliquity of the ecliptic: and published tables. He is the first who made use of sines (instead of chords) and versed sines. He found the length of the year more accurately. He is, beyond all doubt, the only distinguished observer of whom we know anything between Hipparchus and Tycho Brahé.

Alfraganus, or *Al-Fergani*, and *Thubet ben Korrah*, both about A.D. 950. The first has left a work on astronomy; the second is principally remarkable by his having revived an old notion of the Greeks (not mentioned by Ptolemy, but by Theon) of a variation in the position of the ecliptic, which has been called a *trepidation*. (See *Hist. Ast.*, *Library of Useful Knowledge*, p. 33.)

Ebn Yunis, and *Abul-Wefa*, about A.D. 1000. The former, an Egyptian, an observer and mathematician of great merit, has left a work containing tables and observations. He first noted the time of the beginning and end of an eclipse by taking the altitude of a star. His work shows an increasing knowledge of trigonometry. He was the first who employed subsidiary angles. *Abul-Wefa* first formally used tangents, cotangents, and secants, which Albategnius had overlooked. He gave tables of tangents and cotangents.

Alphetradius of Morocco, A.D. 1050, attempted a new explanation of the planetary motions, not worthy of further notice.

Arsachel, a Spanish Moor, A.D. 1080, has left some tables [see *TOLDO*, *TABLES OF*] of indifferent accuracy. His contemporary, *Alhazen*, wrote on refraction. *Geber*, also a Spaniard, (about A.D. 1080?) made some improvements in spherical trigonometry. He introduced the use of the cosine.

Abul Hassan, about A.D. 1200, has left a catalogue of stars, and some improvements in dialling.

We have Persian tables (of the eleventh century?) translated by George Chrysococca, a Greek physician, in the fourteenth century; but the best known are those of Nasir-eddin, published A.D. 1270, under the protection of Hulagu, grandson of Jenghis Khan, and conqueror of Persia. The Persians have a method of intercalating their solar years, which, though complicated, is of surprising accuracy, but when they first began to employ it is unknown. [See CALENDAR.]

Ulug Beg, grandson of Timur, A.D. 1433. This prince made a large number of observations at Samarcand. His catalogue of stars of the date above-mentioned, was, in its day, the most correct ever published. He also gave tables of geographical latitudes and longitudes. The Emperor Akbar (sixth from Timur, died 1605) also encouraged astronomy, and caused many Hindoo works to be translated into Persian.

In China, *Cocheou-King*, A.D. 1280, patronised by Kublai, brother of Hulagu, and fifth successor of Jenghis Khan in the partial conquest which that prince made of China, made a great number of good observations. He introduced spherical trigonometry, and rejected the antient chronology.

Since the fifteenth century, astronomy has declined throughout the East. The Chinese received many methods from the Jesuits, but to little purpose. Among the Hindoos, there are very few who can understand the antient writings. The Turks and Persians have little besides astrology. We now proceed with the chain of European astronomy.

Astronomy was introduced again into Europe by means of the Greek writers, mostly through translations from the Arabic. The first translation of the *Almagest* was made under the auspices of the Emperor Frederic II., about A.D. 1230.

Snecrobosco (an Englishman named *Holywood*), A.D. 1220, wrote a work on the sphere taken from Ptolemy, &c. It continued for a long time in great repute. He also wrote on the Calendar. About the same time, *Jordanus* wrote a curious work on the Planisphere.

Alonso X., king of Castile, A.D. 1252, with the assistance of Arabs and Jews, formed the first European tables. They differ little from those of Ptolemy. [See ALONSO'S TABLES.]

Roger Bacon, A.D. 1255, wrote on the phenomena of astronomy. (For writers of this period, not worth naming, see Delambre, *Hist. Ast. Moy.* pp. 258, 444.)

The Cardinal *Cusa*, A.D. 1440, wrote on the correction of the Calendar. He is said to have maintained the motion of the earth.

George Purbach, A.D. 1460, extended trigonometrical tables, and published a theory of the planets based on that of Ptolemy.

John Müller, called *Regiomontanus*, (died A.D. 1476,) made an abridgment of the *Almagest*, published more extensive trigonometrical tables, extended various parts of trigonometry, and was an observer, though not, in this respect, superior to some of the Arabs. His almanacs were the first which were worthy of the name, and were in great repute.

The two last-mentioned writers deserve some special notice, though it cannot be said that they made any direct advances either in theory or observation. Their writings, and the facilities afforded by their tables, undoubtedly did much to promote a taste for astronomy.

George of Trebizond, called *Trapezuntius*, who died A.D. 1486, first translated the *Almagest* from the Greek into Latin.

Bianchini, A.D. 1495, published tables similar to those of Alonso.

Waltherus, died A.D. 1504, a pupil of Regiomontanus, made numerous observations, which were often reprinted.

The following names are inserted that the reader may know to what names to refer for the astronomy of the time immediately preceding the promulgation of the system of Copernicus. Except in this point of view, there is but little interest attached to their labours:—

Riccius, A.D. 1521, wrote a work on astronomy, containing much historical discussion.

Werner (died A.D. 1528) gave a more correct value of the precession.

Stöffler (died about A.D. 1531) published almanacs for 15 years; wrote on the astrolabe, &c.

Münster (died A.D. 1552) wrote on clocks and dials.

Fracastorius (died A.D. 1543) wrote on the heavenly motions.

In 1528, *Fernel*, who died in 1558, gave a very correct measure of a degree of the meridian, from such insufficient observations, that, as Delambre remarks, the correctness must have been accidental.

Copernicus, born 1473, died 1543. Applied himself to astronomy from A.D. 1500. In 1530, he had finished his tables of the planets, and his work *On the Revolutions of the Heavenly Bodies*, containing an explanation of the COPERNICAN SYSTEM, which, it is almost unnecessary to say, was a revival of the opinions of the Pythagorean school on the motion of the earth. It was published in 1543, and its author died immediately afterwards. Copernicus improved the lunar tables, and gave, to a considerable extent, an explanation of celestial phenomena upon his own system. His book is a mixture of his own original and sagacious notions and of the old philosophy; and he was far from being able to answer the mechanical objections of his time. What might have struck so bold a thinker, had he lived to face opposition, cannot be told, but as the history stands, we shall come to the time of Galileo before we find all objections satisfactorily answered.

From this period, at which the preservation of printed works commences, our limits will not permit our giving more than the names of many astronomers. The reader must refer to the several articles. The following is the list of those who are worth mention between Copernicus and the death of Tycho Brahé; the dates are generally those of death, but where that is not known, the date in brackets is that of the publication of some work.

Copernicus	1543	Vigenera	(1578)
Apian	1552	Stadt	1579
Gauricus	(1552)	Schreckenfuchs	1579
Reinhold	1553	Bressius	1581
Piccolomini	1553	John of Padua	1582
Orontius Fineus	1555	Raimar	(1588)
Gemma Frisius	1555	Schöner	1590
Royas	(1555)	Mæstlinus	1590
Bassantin	1557	William, Landgrave of Hesse Cassel	1592
Recorde	1558	Mercator, G.	1594
Carelli	1558	Digges	1595
Vinet	1564	Rothman	1596
Benedict	(1574)	Galucci	(1597)
Maurolicus	1575	Pini	1598
Rheticus	1576	Tycho Brahé	1601
Nonius	1577		

Of these must be mentioned—

Reinhold, the friend of Copernicus, and advocate of his doctrines, who formed the PRUTENIC TABLES (which see).

Recorde, who wrote the first *English* treatise on the celestial phenomena.

Rheticus, editor of the *Opus Palatinum*, a large trigonometrical table (which see).

Maurolicus, author and editor of several works and tables.

Nonius, inventor of an ingenious method of division of the circle, which has often caused it to be supposed that he anticipated the invention of Vernier.

Mercator (*Gerard*), who gave the first idea of the projection known by his name.

Up to this time, the means of observation had been undergoing gradual improvement, more by attention to the construction of the older instruments, than by the introduction of any new principle. The Copernican theory had its advocates, but was not yet adopted by many. Algebra had been introduced into most parts of Europe, but was not yet in a state to furnish much assistance in trigonometry. Logarithms were not yet invented, nor do we find the *instruments* fixed in the meridian, the telescope, or the pendulum clock. The first observer, who made any important additions to the phenomena of the heavens as received from the Arabs, was Tycho Brahé, to whom we now come.

Tycho Brahé, born 1546, began to study astronomy 1560; commenced his observations at Hoene, an island near Copenhagen, 1582; was driven from thence, 1597; died 1601. He made a catalogue of the fixed stars, more accurate than any which preceded: gave the first table of refractions: discovered the *variation* and *annual equation* (which see) of the moon, the variation of the motion of her nodes, and of the inclination of her orbit, and that of the obliquity of the ecliptic. What was essentially as great a service as any of the preceding, he discarded the *trepidation* of the pre-

cession, already mentioned, which had more or less infected all tables up to his time; he also ascertained that comets (those of his day, of course) were further removed from the earth than the moon; in fact, that they had no parallax which his instruments could discover, thus refuting the notion that they were atmospheric bodies. He greatly improved and extended the instruments in use as well as all the methods of observation.

Tycho Brahé did not admit the Copernican theory; but substituted for it one of his own, usually known by the name of the *Tychonic system*. This consisted in supposing the sun to move round the earth, but all the other planets to move round the sun, being also carried with it round the earth. This system explains all the appearances as well as that of Copernicus; and we must say (though it is always usual to reproach Tycho for refusing to admit the simple system of Copernicus) that by this means the *then* unanswerable arguments against the Copernican system were avoided. In fact, there is nothing but the *aberration of light* (a comparatively recent discovery), which is demonstrably conclusive in favour of the motion of the earth. [See ABERRATION, MOTION (APPARENT).] The system of Tycho is said to have been promulgated by some of the ancients, at least with regard to the inferior planets.

The reformation (as it was called) of the calendar took place in 1582, under Pope Gregory XIII. As the views of those who made the change were rather theological than astronomical, we shall only here mention the fact and the disputes it gave rise to; referring for further information to CALENDAR, CLAVIUS, VIETA, SCALIGER (JOSEPH).

From the time of the death of Tycho Brahé, to that of Newton, which forms the next great epoch in the history of astronomy, we can only dwell generally on a few leading discoveries. To enable the reader to search further, we give a table of all the names between the deaths of Tycho Brahé and Newton which Delambre has thought worthy of any mention, with some few additions. The names mentioned from 1581 to 1727, which are not in this list, will be found in the next. The year of death is given opposite to each name; or where that is not known, the year of some publication is given in brackets. The dates are principally from Weidler, and several from Delambre, compared with those in the first edition of Lalande's *Astronomy*.

Tycho Brahé	1601	Galileo	1642
Bayer	(1603)	Gascoyne	1644
Vieta	1603	Herigonius	(1644)
Nuñez	(1605)	Langrenus	1644
Scaliger, Jo.	1609	Bartoli	(1644)
Clavius	1612	Rheita	(1645)
Pitiscus	1613	Fontana	(1646)
Calvisius	1615	Cavalierius	1647
J. B. Porta	1615	Longomontanus	1647
Wright	1615	Durret	(1649)
Fabricius	1616	Argoli	1650
Magini	1617	Descartes	1650
Napier	1617	Scheiner	1650
Ursinus	(1619)	Wing	(1651)
Tarde	(1620)	Petavius	1652
Marius	1624	Gassendi	1655
Adr. Romanus	1625	Licetus	1656
Gunter	1626	Morinus	1656
Snellius	1626	Tacquet	1660
Wendelinus	(1626)	Street	(1661)
Blaeu	(1628)	Malvasia	(1662)
Vlacq	(1628)	Levera	(1663)
Briggs	1630	Cunitia (Maria)	1664
Malapertius	1630	Deusingius	1666
Vernier	(1631)	Lubienietzky	(1667)
Kepler	1631	Townley	(1670)
Lansberg	1632	Riccioli	1671
Stevinus	1633	Mutus	(1673)
Bartschius	1633	Roberval	1675
Byrge	1633	De Billy	1679
Norwood	(1633)	Borelli	1679
Habrecht	1634	Doerfel	(1680)
Metius	1635	Lefevre	1683
Schickhardt	1635	Picard	1684
Peyresc	1637	Hevelius	1687
Reinerius	1639	Pound	(1687)
Horrox	1641	Greenwood	(1689)
Crabtree	1641	Seth Ward	1689

Auzout	1693
Bouillaud	1694
Mercator, Nic.	1694
Mouton	1694
Buot	1695
Huyghens	1695
Richer	1696
Hooke	1703
Duhamel	1706
Gregory, Dav.	1708
Roemer	1710

Cassini, Dom.	1713
Cotes	1716
Leibnitz	1716
Lahire, Phil.	1718
Lahire, Gabriel P.	1719
Flamsteed	1719
Keill	1721
Wren	1723
Wurzelbaur	(1723)
Newton	1727

As we approach an age in which discoveries proceed rapidly, it would disturb the order of time if we were to enumerate those of individuals together. We shall therefore give the dates in chronological order of the principal accessions to the science, keeping, according to our original plan, only enough to direct the attention of the reader to points worthy of further reference.

1581, or thereabouts, Galileo remarks the isochronism of the pendulum.

1596. Kepler's *Mysterium Cosmographicum*, containing fanciful analogies between the orbits of the planets and the regular solids of geometry.

1603. Bayer's maps, in which the stars are first denoted by letters.

1604. Kepler approximates more nearly to the law of refraction.

1609. Galileo made a telescope from a general description of a magnifying instrument made by one Jansen, in Holland. He used a concave object glass, Jansen a convex. Kepler publishes his work on Mars, in which he establishes, from Tycho Brahé's observations, the elliptic form of the orbit, and the proportionality of the areas to the times. These are called *Kepler's first and second laws*.

1610. Galileo announces the discoveries of Jupiter's satellites—of spots on the moon—of nebulae—of some new appearances in Saturn, afterwards found to proceed from the ring—phases of Venus. He also discovers the diurnal libration of the moon, and that in latitude. Harriot observes the spots on the sun. (This fact has only been known from examination of Harriot's papers in the present century. It appears he got telescopes from Holland.)

1611. Lyncean academy founded. Galileo observes the spots on the sun.

1614. Napier's invention of logarithms.

1616. Prohibition of the theory of Copernicus by the Roman court.

1617. Snellius measures an arc of the meridian at Leyden. This was the first done by *triangulation*, but astronomical instruments were not yet sufficiently perfect to make this method much better than the old one.

1618. Kepler announces his *third law*, that the squares of the periodic times of the planets are in proportion to the cubes of their distances from the sun.

1619. Snellius discovers the law of refraction from one medium into another.

1626. Wendelinus determines the diminution of the obliquity of the ecliptic. He also extended Kepler's law to Jupiter's satellites, and ascertained the sun's parallax.

1627. The *Rudolphine Tables* published by Kepler, from the observations of Tycho Brahé.

1631. Gassendi first observed the transit of Mercury over the sun's disc—measured the diameter of Mercury, and predicted that of Venus with success. Vernier publishes his invention of the instrument which bears his name.

1633. Norwood measured the meridian from York to London, and gave a more accurate value of the degree than his predecessors. Descartes produced his system of vortices. Galileo is obliged to recant his Copernican opinions by the Inquisition of Rome.

1639. Horrox and Crabtree first observed a transit of Venus over the sun's disc. The former ascertained the diameter of Venus. They were the only two who saw this particular transit.

1640. Gascoyne applied the telescope to the quadrant, and a micrometer to the telescope.

1646. Fontana observes Jupiter's belts.

1647. *Selenographia* of Hevelius, in which the moon's libration in longitude is announced.

1650. Scheiner constructs a convex object-glass telescope.

1654. Huyghens completes the discovery of Saturn's ring;

1655. Huyghens discovers Saturn's fourth satellite.
 1657. Academia del Cimento founded.
 1658. Huyghens made the first pendulum clock.
 1659. Huyghens improved the micrometer.
 1660. Mouton applied the simple pendulum to observations of differences of right ascension, and measured the sun's diameter very correctly by it.
 1662. Royal Society of London incorporated. Cassini begins his researches on refraction.
 1663. Gregory makes his reflecting telescope.
 1665. Cassini determines the time of rotation of Jupiter, and publishes the first Tables of the Satellites.
 1666. Cassini determines the rotation of Mars, and makes a first approximation to that of Venus. Academy of Sciences founded at Paris, and observatory first thought of and commenced in the following year. Auzout applied the micrometer to the telescope without any knowledge of Gascoyne. Newton first turned his attention to gravitation.
 1667. Auzout and Picard applied the telescope to the mural quadrant, without knowing that Gascoyne had preceded them.
 1668. Cassini's second Tables of Jupiter's Satellites.
 1669. Newton made his first reflecting telescope.
 1670. Mouton's first use of interpolations.
 1671. Picard and Lahire publish their degree of the meridian, obtained by measuring from Paris to Amiens. Richer, in a voyage to Cayenne, observes the shortening of the seconds' pendulum in approaching the equator. Cassini discovers Saturn's fifth satellite. Flamsteed begins observing at Derby. Cassini begins the observations which led to his discovery of the inclination of the lunar equator, and the coincidence of its nodes with those of the orbit.
 1672. Cassini discovers Saturn's third satellite.
 1673. Huyghens publishes his *Horologium Oscillatorium*, in which are found the first theorems on central forces and centrifugal force. Flamsteed explains the equation of time.
 1674. Hook revived the idea of attraction, but without assigning any law, or connecting it with any observed facts. Spring watches made under the direction of Huyghens.
 1675. Roemer announces his discovery of the velocity of light by means of Jupiter's satellites. Greenwich observatory founded.
 1679. Halley (who went to St. Helena for the purpose) published his *Catalogue of Southern Stars*.
 1679. Appearance of the *Comet des Tems*.
 1680. Flamsteed gave the law of the annual equation of the moon, and corrected the tables accordingly.
 1682. Newton, who had laid aside his theory of gravitation when he found it not capable of verification by taking the best measures of the earth in use, hears of Picard's more accurate measurement, tries it, and finds a remarkable degree of nearness to the result deduced from his celebrated law.
 1683. Cassini and Lahire discontinue till 1700 the arc begun in 1680.
 1684. Cassini discovers Saturn's first and second satellite.
 1687. Newton publishes the *Principia*.
 1689. Roemer first used the transit instrument; that is, fixed a telescope in the meridian for the purpose of observing transits.
 1690. Huyghens's theoretical determination of the ellipticity of the earth. Catalogue of Hevelius published.
 1693. Cassini's third tables of Jupiter's satellites. Announcement of his discoveries on libration. Halley discovers the acceleration of the moon's mean motion.
 1700. The Cassinis (D. and J.) extend the arc which the former had begun southward.
 1705. Halley first predicted the return of a comet, viz. that of 1758.
 1711. Berlin Observatory founded.
 1714. J. Cassini discovers the inclination of the orbit of Saturn's fifth satellite.
 1715. J. Cassini discovers the divisions of Saturn's ring.
 1718. Bradley publishes his tables of Jupiter's satellites. J. Cassini and Maraldi complete at Dunkirk the arc begun by Cassini.
 1725. Flamsteed's *Historia Cœlestis*. Petersburg Observatory founded. Harrison's compensation pendulum.
 1726. Blanchini determines the rotation of Venus.
 1726. Graham invented the mercurial pendulum.

1727. Bradley discovers aberration. Death of Newton.

We have now brought the history to a most remarkable epoch. The great comparative perfection of instruments, the invention of the telescope, of the micrometer, of the clock, of logarithms, the introduction of algebra, the invention of fluxions, and the establishment of the theory of gravitation, in England at least, were so many steps each of magnitude unequalled in former times. But the most meritorious labours of the preceding table are not those which make most show. It takes as much space to say that Cassini discovered a satellite of Saturn as that Flamsteed published the *Historia Cœlestis*; but the first might have been left to the present day without much loss, whereas the latter was a new era in sidereal astronomy. It would have done more for astronomy than the mathematical Syntaxis of Ptolemy, had it been similarly circumstanced: that is, the work of Ptolemy contained only a simple account of what had been done before, with no material improvements either in methods or instruments; whereas that of Flamsteed contained both, and gave a catalogue of stars such as had not been published before. [See FLAMSTEED.] We cannot here help noticing the great use of scientific societies. The theory of Newton was lying idle in his hands for ten years, because he doubted its conformity to fact; and had he not happened one evening at the Royal Society to hear accidentally of the measurement of Picard, it is possible that the *Principia* might never have been published. Various methods and instruments have been invented over again by those who were ignorant of what their predecessors had done; the practical inconvenience of which is obvious, added to the injury accruing to science by the national feeling which discussions concerning the right to inventions has produced in several instances.

The distinct part of Newton's great discovery, which is seldom well understood by any who have not studied it, is—*not* the notion of attraction, which had occurred to many among the ancients, and to Borelli, it is stated, and Hook among the moderns—*not the law*, which had been suggested by Bouillaud or Bullialdus—but the proof that the mechanical deductions from this law of attraction really do represent the celestial phenomena; a combination of improvements in mechanics and mathematics which none but the inventor of fluxions could have made, and a specimen of sagacity which it needed the author of the optics to display. Still less is it true, as many believe, that the Newtonian theory is the Copernican, when they speak of Newton as the establisher of the latter. After what we have said, it is unnecessary to discuss this further than to observe, that it was Galileo who destroyed the mechanical objections to the notions of Copernicus, by the sound system of dynamics of which he was the inventor; and who re-enforced the notions of Copernicus, by arguments of the most forcible character drawn from probability. But it was Bradley who by his discovery of ANABERRATION (which see) furnished the direct and unanswerable proof of the earth's motion; and it is a coincidence worth remembering, that the year of the death of Newton was that of this remarkable accession as well to physics as to practical astronomy.

We shall now proceed to sketch the annals of astronomy from the death of Newton to the present time.

The interval between the death of Newton and the present time may be divided into two parts: the first reaching to the end of the century, abounding in magnificent discoveries both of analysis and observation; the remainder more distinguished by efforts to extend, correct, and methodize the results of the first. In giving a few, as well of the distinguished names, as of their discoveries, we cannot help observing with regret, that in all the histories which have been published, as well of astronomers as of their labours, very little attention has been paid to chronology, and the dates given in different works very often differ. In fact, we know of no work to which we can refer the reader in which he will be certain to find the exact dates of all the principal researches. Lalande's *Bibliographie Astronomique* and Professor Airy's report to the British Association are honorable exceptions in most points, and to them we have been much indebted. The latter is confined to the present century. In collecting, therefore, such facts as have come in our way, we do not pretend to give a complete list of what has been done, or even of the principal points.

The following is the list of names from the death of Newton, arranged in the same manner as the preceding:—

Leadbetter	(1728)	Maraldi II. (J. D.)	1788
Maraldi, J. P.	1729	Roy	1789
Blanchini	1729	Favre	1790
Louville	1732	Legentil	1792
Manfredi	1739	Hell	1792
Sharp	1742	Triesnecker	(1792)

Pouchy	1788	Caturegli	1833

1731. Hadley's quadrant invented

1732. Maraldi (II.) improves the theory of the satellites of Jupiter by observation. The introduction, by Maupertuis, of the Newtonian Theory into France. Wright's Lunar Tables.

1736. Maupertuis, &c. measure an arc in Lapland, and Bouguer and La Condamine in Peru.

1737. Lacaille and Cassini de Thury re-measure the arc of D. Cassini. Clairaut improves the theory of the figure of the earth.

1739. Dunthorn's Lunar Tables.

1740. J. Cassini's Astronomy published, containing many new tables from his own and his father's observations.

1744. Euler's *Theoria Motuum*, &c. the first analytical work on the planetary motions.

1745. Bradley discovers the nutation. Bird began to improve the graduation of mathematical instruments.

1746. Euler's Solar and Lunar Tables. Wargentin's Tables of Jupiter's Satellites.

1747. Euler, Clairaut, and D'Alembert. Various researches in the planetary theory. Mayer's confirmation of Cassini's theory of libration, by observation.

1748. Bouguer proposes a micrometer with two object-glasses, but not that of Dollond. Euler's prize essay on the motions of Jupiter and Saturn.

1749. Euler's and D'Alembert's researches on the precession, D'Alembert's on the nutation, Clairaut's on the motion of the Lunar Apogee. Halley's Tables.

1750. Mayer first uses *equations of condition*. Boscovich measures an arc at Rimini.

1751. Lacaille goes to observe at the Cape of Good Hope.

1752. Lacaille measures an arc at the Cape.

1753. Dollond makes his double object-glass micrometer. Mayer's first idea of the repeating circle.

1754. Chappe publishes the solar and lunar tables of Halley. Clairaut's Lunar Tables.

1756. D'Alembert's researches on the figure of the earth; Euler's on the variation of the elements of elliptic orbits. Mayer's catalogue of zodiacal stars. Clairaut's researches on the perturbations of comets.

1757. Lacaille's *Astronomiæ Fundamenta*.

1758. Lacaille's Solar Tables. Dollond's achromatic object-glass. Clairaut and Lande's researches on Halley's comet.

1759. Lalande publishes Halley's Planetary Tables.

1761. Transit of Venus. Maskelyne at St. Helena.

1762. Euler and Clairaut's researches on the perturbations of comets.

1763. Lacaille's catalogue of southern stars.

1764. Lalande confirms Mayer's observations of libration. Lagrange's prize essay on libration, containing the first application of the principle of vertical velocities. Mason and Dixon begin the measurement of an arc in Pennsylvania.

1765. Harrison gains the parliamentary reward for his chronometer.

1766. Lagrange's theory of Jupiter's Satellites. Bailly's ditto.

1767. First *Nautical Almanac*

1768. Beccaria measures an arc in Piedmont, and Liesganig in Hungary.

1769. Transit of Venus.

1770. Mayer's Solar and Lunar Tables.

1771. Bailly's further researches on Jupiter's satellites.

1772. Bode's law of the distances of the planets.

1773. Lagrange's researches on the attraction of spheroids. Laplace on the secular inequalities of the solar system.

1774. Maskelyne's observations on local attraction at Schehallien.

1780. Mason's Lunar Tables.

1781. Herschel discovers the new planet now called Uranus. Messier's catalogue of Nebulae.

1782. Laplace finds the elements of the orbit of Uranus. Laplace's researches on the attraction of spheroids.

1783. Nouet's tables of Uranus.

1784. Laplace's researches on the stability of the solar system, on the relation between the longitudes of Jupiter's first three satellites, and on the great inequality of Jupiter and Saturn. General Roy measures a base on Hounslow Heath for the connexion of the observatories of Paris and Greenwich. Herschel's catalogue of Nebulae.

1786. Lagrange gives the differential equations for the variations of the elliptic elements.

1787. Laplace's theory of Saturn's ring, and explanation of the acceleration of the moon's mean motion. Herschel discovers two satellites of Uranus. Legendre and General Roy finish the connexion of the observatories of Paris and Greenwich. Beginning of the trigonometrical survey in England. Herschel's first observations with his forty-foot telescope.

1788. Lagrange's *Mécanique Analytique*.

1789. Herschel measures the rotation of Saturn, and discovers the first and second satellites of Saturn. Delambre's tables of Jupiter and Saturn.

1790. Herschel determines the rotation of Saturn's ring, and discovers two more satellites of Uranus. Delambre's tables of Uranus. Maskelyne's catalogue.

1792. Beginning of the French survey. Taylor's Logarithms. Lalande's improved Planetary Tables. Zach's first Solar Tables, and Catalogue of Stars. The *eightieth* comet, whose orbit has been calculated, discovered by Miss Herschel.

1793. Laplace on the satellites of Jupiter and figure of the Earth. Schröter determines the rotation of Venus.

1794. Herschel discovers the fifth and sixth satellites of Uranus. No one, except Sir W. Herschel, has ever seen all the satellites of Uranus. Sir J. Herschel has very lately determined some elements of the first and second, which accord very closely with those given by his father. He has not found the rest, which may arise from the unfavourable southern position of the planet.

1795. Herschel's observations on variable stars, and separation of the milky way into stars.

1796. Establishment of the French Institute. Herschel gives strong presumptions that the rotations of Jupiter's satellites are of the same duration as their orbital revolutions. Oriani on the perturbations of Mercury.

1797. Delambre's observations on refraction. Laplace's theory of tides.

1798. Cavendish demonstrates and measures the mutual attraction of metal balls.

1799. Commencement of the *Mécanique Céleste*.

1799-1804. Humboldt's voyage and observations in South America.

1800. Wollaston's circumpolar catalogue. Bode's maps and catalogue. Mudge begins his great arc of the meridian, from the Isle of Wight to Clifton in Yorkshire.

1801. Lalande's catalogue. Piazzi discovers the planet Ceres. Swanberg begins the measurement of an arc in Lapland.

1802. Olbers discovers the planet Pallas. Lambton begins the measurement of an arc in India. Herschel's catalogue of Nebulæ.

1803. Cagnoli's catalogue. Herschel observes the changes in the position of double stars.

1804. Harding discovers the planet Juno. Piazzi gives the proper motion of 300 stars. Zach's Solar Tables.

1805. Legendre, method of least squares. Discussion on the parallax of the fixed stars, from this date to 1825.

1806. Completion of the French survey by Méchain and Delambre. Delambre's Solar Tables, and Tables of Refraction. Burg's Lunar Tables. Carlini's Tables of Refraction. Pond's catalogue of North Polar Distances (altitude and azimuth instrument). Herschel suspects the motion of the whole solar system towards the constellation Hercules.

1807. Olbers discovers the planet Vesta. Extension of the French arc into Spain. Piazzi's catalogue of 120 stars.

1808. Lagrange and Laplace's Researches on the Planetary Theory.

1809. Troughton improves the division of graduated instruments. Ivory's Theorems on the Figure of the Earth.

1810. Groombridge's Tables of Refraction. Carlini's Solar Tables. Lindenau's Tables of Venus.

1811. Lindenau's Tables of Mars.

1812. Troughton's mural circle mounted at Greenwich. Zach's Tables of Aberration. Burckhardt's Tables of the Moon.

1813. Bessel's Refractions (from Bradley). Lindenau's Tables of Mercury. Pond's catalogue of North Polar Distances (circle).

1814. Piazzi's catalogue of 7646 stars, the best and largest extant.

1815. Brinkley's Tables of Refraction.

1816. Lindenau's Determination of the Nutation. Poisson's Researches on the Planetary Perturbations.

1817. Delambre's Tables of Jupiter's Satellites.

1818. Bessel's *Fundamenta Astronomiæ*. Pons discovers a comet of short period, now called by the name of Encke.

1820. Astronomical Society of London founded.

1821. Observatory of the Cape of Good Hope founded. Bouvard's Tables of Jupiter, Saturn, and Uranus. The Greenwich Observatory first introduced circle observations by reflexion. Poisson on the Precession of the Equinoxes.

1822. Paramatta observatory founded. Harding's *Atlas Cœlestis*.

1823. Beginning of the erection of Cambridge observatory. Ivory's Researches on Refraction. Encke infers a resisting medium of very little density, from observations of the comet of 1818 (an unsettled point).

1824. Herschel, J., and South, Catalogue of Double Stars. Damoiseau's Lunar Tables.

1825. Commencement of Berlin zones. Second mural circle (Jones) erected at Greenwich.

1826. Biela discovers the comet of short period known by his name.

1827. Astronomical Society's Catalogue. Struve's Catalogue of 3112 Double Stars.

1828. Professor Airy discovers a long inequality in the motions of the Earth and Venus. Captain Kater's vertical collimator.

1829. Pond's Catalogue of 720 Stars. Poisson on the Attraction of Spheroids.

1830. Sir J. Herschel's Measures of 1236 Double Stars.

The following list of public observatories now in action is taken from the Report to the British Association above cited:—

Greenwich.
Oxford.
Cambridge.
Edinburgh.
Dublin.
Armagh.
C. of Good Hope.
Paramatta.
Madras.
Bombay.
St. Helena.
Paris.
Marseilles.
Geneva.

Turin.
Milan.
Padua.
Bologna.
Modena.
Naples.
Palermo.
Abo.
Altona.
Bremen.
Christiania.
Dorpat.
Copenhagen.
Königsberg.

Berlin.
Gotha.
Mannheim.
Speyer.
Munich.
Göttingen.
Vienna.
Cracow.
Warsaw.
Wilna.
Ofen.
Kremsmünster.
Brussels.
Cadiz.

There is no public observatory in America. We find in Lalande (*Bibliographie*, &c.) notices of the following, not mentioned in the above list, and, we presume, extinct:—St. Petersburg, Malta, Danzig, Lisbon, and Weissenburg. That of St. Petersburg is about to be re-established. There is much information on different observatories in Bernoulli's *Letters* (Berlin, 1777), and in Quetelet's *Correspondance*, &c., a mathematical periodical now published at Brussels. The *Nautical Almanac* always contains a list of observatories, with their latitudes and longitudes.

To attempt to describe what is now doing and has been done within the last few years would be difficult, and would lead us beyond moderate limits. Undoubtedly, the principal actual accession to our knowledge of the system of the universe is the investigation of the law and quantity of the rotation of double stars. By this, for which the world is principally indebted to Sir J. Herschel and Professor Struve, many new connected systems are added to our list, and the computation of the orbits has proceeded, in several instances, to that degree of precision which justifies the prediction of future positions. [For further details, see STARS (DOUBLE).]

The enormous masses of observations which are now published every year are silently affording the means of increased accuracy in every department, and are rapidly seized and applied for the improvement of the theory. Though we give no account of what is actually in progress, we shall, in various succeeding articles, perhaps be able to supply this defect; and there are some channels which we hope will become open to us during the course of this work.

Among the subjects which we have touched on slightly, we must refer to COMETS, PENDULUM, GEODESY.

Works on the History of Astronomy.—Sherburn's edition of Manilius (London, 1675) contains a list and short account of a very large number of astronomers, and has been much used by succeeding authors. It is superseded by the *Bibliographie* of Lalande (Paris, 1803), which gives a list of every astronomical work, with its title, and also an enormous alphabetical list of astronomers. This work also contains the history of astronomy from 1781 to 1802. Weidler's *Historia Astronomiæ* (Wittenberg, 1741) is a valuable collection of facts, and may be consulted with better chance of finding a date than any we have seen. Costard's *History of Astronomy* (London, 1767) is of little use for reference, but would be instructive to a reader who has not much mathematics. It is well spoken of by Lalande. Bailli's *Histoires*—1. Of Antient Astronomy (Paris, 1775); 2. Of Modern Astronomy up to 1730 (Paris, 1778); 3. Of Modern Astronomy from 1730 to 1781 (Paris, 1782); 4. Of Indian and Oriental Astronomy (Paris, 1787)—are entirely devoted to a system, and should be looked at with caution. *The Histories* of Delambre—1. Of Antient Astronomy (Paris, 1817); 2. Of the Middle Ages (Paris, 1819); 3. Of Modern Times (Paris, 1821); 4. Of the Eighteenth Century (posthumous) (Paris, 1827)—contain a full description and discussion in order of persons, not of time, which render them difficult of reference, but still they are the best works of the kind. The historians of mathematics—Vossius, Montucla, Kästner, Bossut, and Delambre, *Rapport Historique*, &c. (Paris, 1810)—treat astronomy as a part of their subject. The small work of Laplace, *Précis sur l'Histoire de l'Astronomie* (Paris, 1821), which is also to be found in the *Système du Monde*, is delightfully written; and there is also much information in the historical chapters of the fifth volume of the *Mécanique Céleste*, and occasionally in the other volumes. Lalande's *Astronomy* was called *La Grosse Gazette* by a rival, on account of the varied historical and mythological information which it contains. Hutton's *Dictionary*, and Martin's *Biographia Philosophica*, contain information on English astronomers which is not to be found in the foreign works;

and there is a good deal in Thomson's *History of the Royal Society*. For the history of astronomy from 1781 to 1810, there is Voiron, *Histoire, &c., depuis 1781 jusqu'à 1811*, which contains an interesting account of physical discoveries, and the measures of the earth; but it is very imperfect in dates. There is a tract on the history of astronomy by Dominic Cassini, published in 1693, which we have not seen. For a further list of writers, see Lalande's *Bibliographie*. The general reader may consult with advantage the *History of Astronomy*, and the *Lives of Kepler and Galileo*, in the *Library of Useful Knowledge*, or of *Natural Philosophy in the Cabinet Cyclopædia*.

In addition, we may refer to the *éloges* published by the Academy of Sciences, which are to be found in their *Mémoires*; to the two separate collections of *éloges* by D'Alembert and Condorcet; to the *Annual Reports of the Royal Society, Astronomical Society, and British Association*.

ASTRUC, JOHN, a French physician of great eminence, was born at Sauve, in Languedoc, in the year 1684: he studied in the University of Montpellier, and took the degree of doctor in medicine in 1703. In 1706, being then only twenty-two years of age, he began to teach medicine in the same university, acting as substitute to Chirac, one of its professors, who had been forced to attend the French army. In 1710 Astruc obtained by competition the chair of anatomy and medicine in the University of Toulouse, where he revived the study of anatomy. The reputation, however, which he now acquired caused him to be soon recalled to Montpellier, where he occupied a medical chair from 1715 to 1728, when he resorted to Paris, chiefly urged, it is said, by the desire to have access to the great literary stores of that capital. On his arrival at Paris, he was induced to accept the situation of first physician to the king of Poland and elector of Saxony, but after a very short stay at Dresden he returned to Paris, and was, in 1730, appointed a consulting physician to the king of France, and in 1731, professor of medicine in the College of France. He became a member of the medical faculty of Paris in 1743, and died in 1766, at the advanced age of 82.

Astruc does not seem to have been endowed with an intellect of a very superior cast, and no great discovery is attached to his name; nevertheless, he acquired great celebrity among his contemporaries, both as a teacher and as an author; and the integrity of his character was justly appreciated. A simple and happy method in treating the subjects which he taught, and an easy, clear, and eloquent language, recommended him as a lecturer. His writings displayed a solid and extensive acquaintance with the history of literature and science, unusual among his countrymen even at that time,—the result of the unvaried assiduity with which from his early youth, and during the whole of his long career, he applied himself to bibliographical learning. Astruc has left a considerable number of works on medicine, on the topography of Languedoc, his native country, on metaphysics, and even on sacred history. We shall allude only to the more important of his literary labours.

His first writings referred to the theory of *digestion*, which he endeavoured to explain according to the principles then prevalent of the philosophy of Descartes. This subject led him at one time into a discussion with Vieussens, and at another into a dispute with Pitcairn, in which both adversaries probably were equally distant from the truth; but Astruc had greatly the advantage, in as far as he always kept within the bounds of calm and dignified language, while Pitcairn was full of violence and abuse. When, in 1720, the plague spread its ravages in Marseilles and its environs, Astruc published three successive treatises on this subject, in which he showed the disease to be contagious, and insisted on the necessity of quarantine measures. After his arrival in Paris, he took an active part on the renewal of those contests which had so long prevailed between the physicians and the surgeons of that capital, and his pamphlets seem to have materially contributed to bring about the victory which the physicians gained on this occasion (in 1738) in a court of law. A treatise on *Tumours and Ulcers*, which appeared in 1759, and which, being merely an abstract of Astruc's lectures, contains nothing new, was, in 1761, followed by a treatise on the *Diseases of Women*, in which the author displayed his usual erudition. Astruc's most extensive work, however, and that which has more than all others served to establish his high reputation, is the book *De Morbis Veneris*, first published in one vol. 4to., Paris, 1736, and afterwards enlarged to two vols. 4to.

in the second edition, 1740. The practical part of this work has ceased to have any value, in consequence of the various changes which time has brought about in our notions of the diseases treated of; but the literary history of the disease, which occupies the latter half of the work, and embraces a chronological account of above six hundred authors on the subject, will always be referred to as a valuable document of bibliographical research. Yet the list of authors collected by Astruc is by no means complete—a German writer, Gertanner, having since added about 300 names not mentioned by Astruc. Astruc was a strenuous partisan of the opinion that syphilis had been imported into Europe by the discoverers of America, and the historical evidence brought forward by him in support of this hypothesis has been the chief cause of its general adoption. He does not, however, seem to have been altogether impartial in this inquiry, and more recent investigations have tended to invalidate his hypothesis, by showing on the one hand that traces of syphilis have occurred in Europe at all periods of history; and on the other, that the silence of the great majority of Spanish and Portuguese contemporary chronicles on the events supposed to have attended the introduction of the new disease, is irreconcilable with the statements on the authority of which the American origin of syphilis is maintained. The first edition of this work was translated into English by William Barrowby, M.D., Lond. 1737, 2 vols. 8vo.

A full account of Astruc's life has been given by Lorry in his posthumous edition of that author's *Mémoires pour servir à l'Histoire de la Faculté de Montpellier*, Paris, 1767. See also Hason, *Notice des Hommes Célèbres de la Fac. Méd. de Paris*, (Paris, 1778,) p. 256; and the *Biographie Médecinale*, tom. i.

ASTUR, in Zoology, a genus of hawks formed by Bechstein, and characterised by a short beak bent downwards from the base and convex above, with somewhat oval nostrils. The feet are rather short, and the toes (of which the exterior are united at the base by a membrane) are long.

Numerous species of this genus are diffused over all parts of the world; but Europe only contains one, *Astur palamarius*, the goshawk, so highly prized by the falconers of old, and famous for its flights at cranes, geese, pheasants, and partridges.

ASTURIAS, Principality of, a province of Spain, situated between 42° 58' and 43° 40' N. lat., and 4° 30' and 7° 8' W. long.: it is bounded on the east by that district of Old Castile commonly called Montañas de Santander, on the west by Galicia, on the south by the kingdom of Leon, and on the north by the Bay of Biscay. A chain of mountains, called by some geographers the Asturian Pyrenees, forms the entire southern boundary. This boundary runs from near the source of the Ebro, in a western direction, taking the different denominations of Sierra de Sejos, the highest point of which is at an elevation of 5700 feet above the level of the sea; Sierra de Alba, 6960; Sierra de Pajares, 8628; Sierra de Peñaranda, 11,031; Sierra de Pefiamelera or Pefiamelera, 9465. To this last point, the range bears the name of Montañas de Asturias, the Mons Vindius of Ptolemy. It then branches out in different directions, and crossing the provinces of Leon, Galicia, and the north of Portugal, abuts on the ocean at the points of Cape Ortegal, Finisterre, and Silheiro, north of the Minho. The southern slope of this range is very abrupt; but on the north it gradually diminishes in height as it approaches the sea. The main mass is composed of calcareous rocks, little inferior in height to the Aquitanian Pyrenees, and covered with snow the greater part of the year. Marble and a hard sort of sand-stone used for grinding stones, are also found, as well as copper, succinum or mineral amber, though not of the purest kind, cinnabar, iron, zinc, lead, antimony, jet, and coals, of which the Asturias transport every year 4500 tons into the interior of the peninsula. About three miles west of Oviedo, at a place called Las Caldas, is a spring of mineral water almost at the boiling point, which flows out of a calcareous rock. At the distance of a musket-shot from that spring is a ruined castle built of limestone, in which a sort of inferior amethyst is found imbedded, erroneously taken for diamonds by Casal in his *Historia Natural y Médica de Asturias*.

The mountainous parts of the province are covered with forests of oak, beech, chestnut, and other trees, which supply the arsenal of Ferrol with excellent timber. It is a common practice in Asturias to cut large boards out of the chestnut

trees without entirely destroying them. Don Mariano Lagasca says, that he saw several of these trees, half of the trunk of which had been sawed off in this manner, and still continued, for several years, to produce abundant fruit, without presenting any outward appearance of decay. These forests abound with bears, wolves, foxes, and other species of wild animals. There are likewise several medicinal plants, among which is the hellebore; six species of the erica or heath, two of the angelica, the sarsaparilla, and the dulcamara, have been made known by the celebrated botanist just quoted, Don M. Lagasca. The hills are covered with brush-wood, cistus, and furze, which the inhabitants use for fuel. They make the same use of the turf or peat, which is found in great abundance in the western districts.

The offsets of the great range form numerous lateral valleys, drained by a number of rivers which flow from the mountains, generally in a direction from south to north. The principal of these rivers are the Sella, in the eastern part of the province, the Nalon, the Navia, and the Eo in the extreme west, which also forms the boundary between Asturias and Galicia in the lower part of its course.

The coast of Asturias is so exceedingly bold and rocky, that its ports can only receive small trading vessels and fishing boats. There are a great number of small ports and *rias* (mouths of rivers), up many of which the sea-water ascends three or four miles into the interior. The principal ports, from east to west, are Llanes, Ribadesella, Lastres, Villaviciosa, Gijon, Candás, Luanco near the cape of Peñas, Avilés, Mures on the ria of Pravia, Cudillero, Luarca, Navia, and Castropol opposite to Ribadeo in Galicia. The harbours of Ribadesella and Cudillero are safe and commodious; and the former has good docks capable of receiving ships of forty guns.

The Nalon has its source on the northern slope of the Asturian mountains (43° N. lat., and 3° 24' W. long.), and flows W.N.W. by Oviedo, forming, as it empties itself into the sea, the ria of Pravia. Its affluents are the Caudal, the Trubia, and the Narcea, all on the left bank. The Navia rises near the village of Zebrero in Galicia, enters Asturias on the west, and flowing almost due north forms the ria to which it gives the name. The course of these two rivers cannot much exceed sixty miles.

The valleys are exceedingly fertile, and afford pasture for numerous horned cattle, pigs, and horses. The horses are of small size, but renowned for their strength and swiftness. The rocks on the sea-shore are covered with sea-weeds, polypi, and zoophytes, which the farmers use as manure. On some of these rocks the *roccella tinctoria*, or true dyers' orchil or archil, is found. Fruit is also very plentiful in this province. Chestnuts, hazle-nuts, apples, and pears, are the chief varieties. The vine is cultivated in the commune of Cangas de Tineo, and near Avilés, in a district called Candamo: in both places a sort of light and agreeable wine is made for home use, far superior to the chacoil of Biscaya. There is however a deficiency of this article, which is abundantly compensated for by the excellent cider, easily obtained in every part of the province. Common wheat is not generally cultivated here; not however, as Antillon says, on account of the dampness and cold of the climate, but because the Asturians prefer the *escanda* or spelt-wheat, and the Indian corn, to any other sort of grain. The best species of common wheat is raised in great perfection; but the *escanda* is better adapted to the climate, and the species cultivated in Asturias is so much esteemed by the natives, that in many districts the leases, which provide for the payment of the rent in kind, contain a stipulation that no sort of corn shall be offered in payment except *escanda*. Besides the excellent quality of the bread made from *escanda*, it is observed that it keeps moist and fresh much longer than that made from any other sort of grain. The Indian corn being planted much thinner than any other sort of corn, leaves sufficient space between the rows for the growth of pumpkins. The Asturian farmers also plant *judas* or scarlet-runners together with the Indian corn, so that the judas climb up its stem; and thus they have three kinds of produce growing together on the same ground. The stem of the Indian corn affords a nutritious food for the cows in winter; with the grain they make bread, and with it they also feed their fowls and pigs; the ear or head they use for fuel after the corn has been thrashed out.

The climate of Asturias is exceedingly damp and cold in the mountainous parts; but in the valleys, and particularly on the sea-coast, it is so mild and temperate, that

orange and lemon trees grow in the open air. In the seventeenth century great quantities of this delicious fruit were exported from Asturias to the northern countries of Europe; but since the free trade between South America and the ports of the Mediterranean has been established, the raising of those trees has been abandoned in Asturias, the fruit of that principality not being able to compete in its abundance and quality with that produced in the southern provinces, which is carried back by foreign vessels that visit the Spanish ports on the Mediterranean. Among the other vegetable productions, the parsnip may be mentioned as indigenous in Asturias.

Both the seas and rivers of this province produce the most delicate fish in the peninsula, which is sent to the market of Madrid both fresh and pickled.

Asturias is divided into *concejos*, or communes, of which there are 118. The superintendence of these *concejos* is distributed among fifty-six towns: they contain 668 parishes, 3665 villages, and 23 convents for both sexes. The population, according to the census of 1808, amounted to 364,238 souls, upon a surface of about 2148 English square miles; but the *Mapa de España*, published by the geographical establishment at Madrid in 1834, estimates the population at 434,635. The area, however, seems a great deal less than what is marked on some maps as belonging to Asturias. The area given by Antillon is calculated on the maps of Lopez, which are far from correct. Bory St. Vincent says, that Asturias is forty leagues long, and from ten to twelve wide. Miñano allows it thirty-six leagues in length and sixteen in breadth. If we allow it an area of 400 square leagues of twenty-five to a degree, the area will be above 3000 square miles.

A military governor, an intendant, and an *audiencia*, or a civil and criminal high court of law, preside respectively over the military, fiscal or financial, and judicial affairs of the principality. The internal administration is directed by the common council of the respective *concejos*. There is also an ecclesiastical tribunal and one bishop. For the education of the youth there is a university at the capital, Oviedo, several seminaries, and the Instituto Asturiano at Gijon, on the coast, founded by the illustrious patriot Don Gaspar M. de Jovellanos in 1794, and provided with professors of mathematics, mineralogy, and navigation.

The only manufactories of Asturias are, a royal manufactory of fire-arms at Trubia, a few others belonging to private individuals for the fabrication of copper and earthenware, jet trinkets, some tanneries, and looms for common woollen and linen stuffs, principally for home consumption. With these exceptions, its manufactories are not in a more advanced state than in the rest of the peninsula. The real cause of this deficiency is the want of inland communication with Castile. Till within a few years there was not a single road for carriages of any sort, and all the traffic with that part of the kingdom was carried on by means of mules and horses. The principal road, which is the new Camino Real de Asturias, and runs from Madrid to Medina-de-Rio-Secco, passing through Mayorga, Mansilla, Leon, Pola-de-Lera to Oviedo, has been recently made. There is also another road between Oviedo and Grado, about twelve miles N.N.W. of Oviedo. The principal *puertos*, or passages across the mountain, are, reckoning from east to west Tarna, Piedrafitá, Pajares, Somiedo, Leitariegos, Cerrado and Peñamellera.

According to the historian Garibay, a Celtic tribe called Astixos, or Astiros, at a very early period passed from Gaul into Spain, and settled in the north and north-west districts. They inhabited a territory much more extensive than the modern Asturias, for it reached to the banks of the Duero. Their chief town was Asturica, now Astorga, in Leon. They were but very imperfectly known by the Romans, who often confounded them with their neighbours, the Gallaici. For a long period they lived unknown in their valleys, without exciting either the envy or jealousy of the neighbouring nations. Augustus Cæsar partly subdued them, and at the fall of the Roman empire, they shared the same fate with the other Roman provinces in the Peninsula. When the hordes of Tarik and Muxa overthrew the Gothic monarchy in the Peninsula, those few who escaped the sword of the infidels, or refused to bend their necks beneath the ignominious yoke, sought an asylum in the fastnesses of the Asturian mountains, and headed by the immortal Pelayo, dared alone to defy the power of the victorious Crescent. Alxaman Suleyman,

and Munuza, or Manuza, who successively attempted to penetrate into this province, remained with their hosts buried in the deep ravines of Cobadonga; and these were the first of a succession of triumphs, which at length ended with the total expulsion of the Mohammedans from Spain. Twelve kings reigned successively in Asturias, from 718, in which Pelayo was proclaimed, until 914, when having extended their conquests over almost one-fourth of the Peninsula, they assumed the title of kings of Leon; Ordoño the Second was the first who established his court at the city of Leon. In 1388, the Infante Don Enrique, the eldest son of Juan I., was styled Principe de Asturias, from which period the eldest sons and daughters of the kings of Spain have taken that title. 'It is in the inhabitants of Asturias,' says Bory de Saint Vincent, 'that the naturalist can discover the characteristic features of that Celtic race, which we consider to be the third of the Japhetic race.' The Asturians speak the Castilian language.

The Asturians are strong and robust, frugal, honest, intelligent, not very active, but constant in their labours, passionately fond of their country, proud of their noble descent, and of having never mixed their blood with any of the nations that have had dominion over the Peninsula. (See Antillon, Miñano, Garibay, and Casal, *Historia Natural y Medica de Asturias; Orographie de l'Europe, &c.*)

ASTYAGES. [See MEDIA.]

ASY, or AZY, the river of Antioch. [See ORONTES.]

ASYLUM, the Latin and English form of the Greek ἄστυλον, which is generally supposed to be made up of a *privative* and the root of the verb σπλάω, 'to plunder,' and therefore to signify, properly a place free from robbery or violence. Some, however, have derived the Greek word from the Hebrew גֹּזֵן, 'a grove;' the earliest asylums, it is said, having been usually groves sacred to certain divinities. It is a pretty, rather than perhaps a very convincing illustration of this etymology, which is afforded by Virgil's expression as to the asylum opened by Romulus,—

* Hinc lucum ingentem, quem Romulus acer asylum
Retulit.—ÆN. VIII. v. 343.

The tradition was, that Romulus made an asylum of the Palatine Hill preparatory to the building of Rome. Plutarch tells us that he dedicated the place to the god Asylæus. (Plut. *Romul.* 9.)

Probably all that is meant by these stories is, that in those ages whoever joined a new community received shelter and protection; and even if he had committed any crime, was neither punished by those whose associate he had become, nor surrendered to the vengeance of the laws or customs he had violated. Such an asylum was not an appointed place of refuge established by general consent; it was merely a congregation of outlaws bidding defiance to the institutions of the country in which they had settled, and proclaiming their willingness to receive all who chose to come to them.

But both in the Grecian states, and in Rome, the temples, or at least some of them, were endowed with the privilege of affording protection to all who fled to them, even although they had committed the worst crimes. The practice seems to have been, that they could not be dragged from these sanctuaries; but that, nevertheless, they might be forced to come out, not only by being prevented from receiving food while they remained, but even by such compulsory measures as the application of fire to the building. (See Thucyd. i. 126, 134.; Herodot. vi. 80.) Anything appears to have been permitted except the actual dragging forth of the criminal. Eventually, these places of refuge became great nuisances, being, especially among the Greek cities, established in such numbers as sometimes almost to put an end to the administration of justice. After Greece had become a part of the Roman empire, an attempt was made to repress this evil by an order of the senate, directed to all the pretended asylums, to produce legal proofs of the privilege which they claimed. (Tacit. *Annal.* iii. 60, &c.) Many were put down in consequence of not being able to satisfy this demand. At last, all the asylums throughout the empire were abolished by an edict of the Emperor Tiberius. (Sueton. in *Vita Tiberii*, cap. 37.)

The term ἄστυλος was given as an epithet to certain divinities; as, for example, to the Ephesian Diana. It is also found on medals as an epithet of certain cities: in which application it probably denoted that the city or district was under the protection of both of two otherwise belligerent powers, and enjoyed accordingly the privileges of neutral ground.

After the decline and fall of Paganism, the privilege of serving as asylums for malefactors was obtained by the Christian temples. The credit of conferring this honour upon churches in general is attributed to Pope Boniface V. in the beginning of the seventh century; but more than two hundred years before, certain sacred buildings of the new religion are said to have been declared asylums by the Emperor Honorius. The asylums thus established eventually grew throughout all Christendom to be a still more intolerable abuse than those of the ancient world had been. In most countries, not only churches and convents, with their precincts, but even the houses of the bishops, came to be at length endowed with the privilege of sanctuary. In all these places the most atrocious malefactors might be found bidding defiance to the civil power. At the same time, there can be no doubt, that while in this way criminals were frequently rescued from justice, protection was also sometimes afforded to the innocent, who would not otherwise have been enabled to escape the oppression or private enmity which pursued them under the perverted forms of law. The institution was one of the many which then existed, having the effect of throwing the regulating power of society into the hands of the clergy, who certainly were, upon the whole, the class in whose hands such a discretion was by far least likely to be abused. When communities, however, assumed a more settled state, and the law became strong with the progress of civilization, the rights which had at one time armed the church as a useful champion against tyranny, became not only unnecessary but mischievous. The church maintained a long and hard struggle in defence of its old supremacy; and in the face of the stand thus made, and in opposition to ancient habits, and the popular superstition by which they were guarded, it was only very cautiously that attempts could be made to mitigate the evil. For a long time the legal extent of the privilege of sanctuary appears to have been matter of violent dispute between the church and the civil power. In this country, it was not till the year 1487, in the reign of Henry VII., that by a bull of Pope Innocent VIII. it was declared, that if thieves, robbers, and murderers, having taken refuge in sanctuaries, should sally out and commit fresh offences, and then return to their place of shelter, they might be taken out by the king's officers. It was only by an Act of Parliament passed in 1534, after the Reformation, that persons accused of treason were debarred of the privilege of sanctuary. After the complete establishment of the Reformation, however, in the reign of Elizabeth, neither the churches nor sanctuaries of any other description were allowed to become places of refuge for either murderers or other criminals. But various buildings and precincts in and near London, continued for a long time after this to afford shelter to debtors. At length, in 1697, all such sanctuaries, or pretended sanctuaries, were finally suppressed by the Act 8 and 9 William III. chap. 26.

In Scotland, the precincts of the palace of Holyrood in Edinburgh still remain a sanctuary for debtors. The boundaries of this privileged place are somewhat extensive, comprehending the whole of what is called 'the King's Park,' in which is the remarkable hill called 'Arthur's Seat.' The debtors find lodgings in a short street, the privileged part of which is divided from the remainder by a kennel running across it. Holyrood retains its privilege of sanctuary as being a royal palace; but it is singular as being now the only palace in this country any part of the precincts of which is the property, or at least in the occupation, of private individuals, and therefore open to the public generally.

In England, a legal asylum, or privileged place, is called a sanctuary; and this use of the word sanctuary appears to be peculiar to the English language. Both in this country and in America, the name of asylum is commonly given to benevolent institutions intended to afford shelter neither to criminals nor to debtors, but to some particular description of the merely unfortunate or destitute. Thus there are in London,—the Asylum for Recovery of Health, Asylum for the Deaf and Dumb Children of the Poor, Asylum for the Cure of Scrofula and Cancer, Licensed Victuallers' Asylum, Surrey Asylum for Employment of Discharged Prisoners, Westminster Asylum for Persons who have been Prosecuted for First Offences, Invalid Asylum for Females, &c.

The Jewish Cities of Refuge, established by Moses and

Joshua, may be quoted as the most remarkable instance on record of a system of asylum founded and protected by the state itself for the shelter of persons who had violated the law. These cities, as we are informed in the twentieth chapter of the Book of Joshua, were six in number, three on each side of the Jordan. They only, however, protected the person who had killed another unawares. With regard to such a person the command was, 'If the avenger of blood pursue after him, then they shall not deliver the slayer up into his hand; because he smote his neighbour unwittingly, and hated him not beforetime. And he shall dwell in that city, until he stand before the congregation for judgment, and until the death of the high priest that shall be in those days; then shall the slayer return, and come unto his own city, and unto his own house, unto the city from whence he fled.' (Joshua xx. 5, 6.) This institution may be regarded as an ingenious device for protecting, on the one hand, the guiltless author of the homicide from the popular resentment, which his unfortunate act would have been likely to draw upon him; and cherishing, on the other, in the public mind, that natural horror at the shedding of human blood, which, in such a state of society, it would have been so dangerous to suffer to be weakened. We see the same principle in the deodand awarded by our law in the case of the accidental destruction of life by any inanimate object.

One of the most curious instances of the privilege of sanctuary, is that long enjoyed in Scotland by the descendants of the celebrated Macduff, Thane of Fife, the dethroner of the usurper Macbeth. It is said to have been granted at the request of the thane by Malcolm III. (Canmore), on his recovery of the crown of his ancestors soon after the middle of the eleventh century. By this grant it was declared that any person, being related to the chief of the clan Macduff within the ninth degree, who should have committed homicide without premeditation, should have his punishment remitted for a fine, on flying to Macduff's Cross, which stood near Lindores, in Fifeshire. Although this, however, is the account of the old Scottish historians, it is probable that the privilege only conferred upon the offender a right of being exempted from all other courts of jurisdiction, except that of the Earl of Fife. Sir Walter Scott, in his *Minstrelsy of the Scottish Border*, has printed a Latin document of the date of A.D. 1291, in which the privilege to this latter extent is pleaded in favour of an Alexander de Moravia, an ancestor of the present Mr. Moray of Abercainry. The original deed still exists. Of Macduff's Cross only the pedestal now remains, the cross itself having been destroyed at the Reformation. It bore a metrical inscription, in a strange half-Latin jargon, the varying copies of which, still preserved, have given much occupation to the antiquaries. (See Sibbald's *History of Fife*, particularly the second edition, 8vo. Cupar-Fife, 1802; Cunningham's *Essay upon Macduff's Cross*; and Camden's *Britannia*, by Gough.)

A'SYMPOTOTE (ἀσύμπτωτος), a compound Greek word signifying *which does not fall with*, if taken literally with respect to two lines, it would mean that they do not meet one another. But it is used only in speaking of two lines (one of which at least must be curved) which continually approach each other, but never meet; so that the distance between them diminishes without limit, or they may be brought to any degree of nearness, without ever actually meeting.

This appears a paradox to beginners in geometry, who are generally unable to imagine it possible that two lines should continue to approach one another for ever, without absolute contact. But this arises from their confounding the thing called a straight line in practice (which is not a straight line, but a thin stroke of black lead or ink, as the case may be) with the straight line of geometry, which has neither breadth nor thickness, but only length. And they also imagine that if two lines might be asymptotic, the fact might be made visible, which is impossible, unless the eye

could be made to distinguish any distance, however small. But if the unassisted eye cannot detect a white space between two black lines, unless that space be a thousandth of an inch in breadth, which is about the truth, it is evident that two geometrical surfaces with asymptotic boundaries, such as A B C, D E C would appear to coincide from the point where the distance between them is about the thousandth part of an inch. The idea of a geometrical asymptote is therefore an effort of pure reason, and the possibility of it must be made manifest to the mind, not to the senses.

A L M B C D is a vessel of water, of which the sides and bottom are extended indefinitely towards G and R; the end A L is fixed, but the end B M is moveable parallel to its first position, so as always to form a water-tight obstacle; by which means the length of the vessel may be increased to any extent, while its breadth and height remain the same. Let the water be a perfect fluid, without any adhesion to the sides of the vessel (which is mathematically possible, though not physically), and let the bottom of the vessel be geometrically horizontal. Then, as the end M B changes its position and moves towards G R, it is manifest that the vessel will grow larger, and the level of the water will fall. Suppose the side L K to be of glass. Thus when the vessel ends at E P, the water may stand at S V; when the end is at F Q, the water may stand at T W, and so on. But the level of the water never can fall absolutely to the bottom C K; for so long as the preceding mathematical suppositions hold good, and there is some water in the vessel, it must stand at some determinate height above the bottom. As the end B M moves to the right, let the curve M V W, &c., mark out the positions of the level upon the edge of the moving end, as is done in the diagram. Then for the reason above given, this curve never can meet the line C K, though obviously in a state of continual approach towards it. Hence the curve M V W and the line C K are asymptotes.

As another illustration, let there be two parallel lines A B, C D, the perpendicular distance of which is A C; and from A, with different radii, describe arcs of circles P 1, Q q, R r, S s, &c. From A B on all these circles measure arcs equal in length to the straight line A C; that is,

let P 1, Q 2, R 3, . . . W 7, &c., be all equal to A C. Now it is plain that the arcs Q q, R r, &c., are all greater than A C, and will continue so, however great the radius may be; for A C is the shortest distance which can be drawn from one parallel to the other. But as the radius is extended, the arcs T t, V v, &c., become more upright, as a person unused to geometrical phraseology would say, that is, more and more nearly coincident with a perpendicular drawn from A B; they also become more and more nearly equal to A C. Hence the points 5, 6, 7, &c., come nearer and nearer to C D, with which they would actually coincide, if it were possible that one of the arcs could become equal to A C. Hence the curve, 1, 2, 3, &c., is an asymptote to C D.

The mathematical theory of asymptotes will be found in all works on the theory of curves, and in most on the differential calculus. The following are the most general notions which it will be within our limits to give, and will be understood by a moderately well-informed mathematician. If the equation of a curve be $y = \phi(x)$, and if the function $\phi(x)$ can be separated into two others, say $\psi(x)$ and $\chi(x)$, of which $\chi(x)$ diminishes without limit either when x is increased without limit, or made to approach without limit to any given quantity: then the curve whose equation is $y = \psi(x)$ is an asymptote to the curve whose equation is $y = \phi(x)$ or $\psi(x) + \chi(x)$. For the difference of the ordinates of the two curves (to a common value of x) is $\chi(x)$, which diminishes without limit. For instance, let the first curve have the equation

$$y = \frac{bx}{x-a}$$

since $\frac{bx}{x-a}$ is $b + \frac{ab}{x-a}$, of which $\frac{ab}{x-a}$ decreases without limit when x is increased without limit, it follows that the straight line having the equation $y=b$ is an asymptote to the curve. If the preceding equation be reversed and put under the form

$$x = \frac{ay}{y-b}$$

similar reasoning will show that the straight line where equation is $x=a$ is also an asymptote. If the first expression be developed in inverse powers of x , giving

$$y = b + \frac{ba}{x} + \frac{ba^2}{x^2} + \frac{ba^3}{x^3} + \&c.$$

the equations of curves which are asymptotes to the preceding may be found by taking any of the preceding terms for y , provided b be always one. Such are

$$y = b + \frac{ba}{x}$$

$$y = b + \frac{ba^2}{x^2} + \frac{ba^3}{x^3}$$

or generally, any curve whose equation is

$$y = b + \chi(x)$$

where $\chi(x)$ diminishes without limit, when x is increased without limit, is an asymptote to the preceding. Observe that a curve may first cut another, then recede from it, and afterwards become an asymptote to it.

The following is a mere sketch of the most general method of finding asymptotes to algebraical curves. The first part of the method detects the number and direction of the rectilinear asymptotes, those only excepted which are parallel to either axis of co-ordinates, which will easily admit of a separate determination.

Clear the equation of all radicals. Suppose it then of the second degree, though the same reasoning applies to all degrees. Its form will then be (putting all the highest terms on one side)

$$ax^2 + bxy + cy^2 + dx + ey + f = 0$$

The following theorem can then be demonstrated. If the equation

$$ay^2 + bxy + cx^2 = 0 \quad (A)$$

be possible, then it is the collective equation of two lines passing through the origin of co-ordinates, which two lines are parallel to two asymptotes of the curve and the curve can have no others. It is a well-known theorem that any algebraical equation between x and y , which is homogenous with respect to these letters, is not the equation of a curve, but of a collection of straight lines passing through the origin. Thus the asymptotes of the curve of the third degree will be determined by the solution of an equation of the form

$$ax^3 + bx^2y + cxy^2 + dy^3 = 0$$

which may belong either to one or three straight lines.

If $y=kx+l$ be the equation of an asymptote, the value of k may be any one of the values of $\frac{y}{x}$ determined from the equation (A). To find l , remember that any homogenous algebraical expression of the m th degree, containing x and y , may be expressed by the form

$$x^m \phi\left(\frac{y}{x}\right)$$

and let the equation of the curve, when its various sets of homogeneous terms have been collected, be

$$x^m \phi\left(\frac{y}{x}\right) + x^{m-1} f\left(\frac{y}{x}\right) + \&c. = 0$$

Then if $\phi'(k)$ represent the differential coefficient of $\phi(k)$, the equation of the asymptote is

$$y = kx + \frac{f(k)}{\phi'(k)}$$

when the highest dimension in the equation exceeds the next highest by more than one, all the asymptotes must pass through the origin of co-ordinates.

The term asymptote is first found in the Conic Section of Apollonius; and the properties of the hyperbolic asymptote are found in the second book of his Conic Sections.

ASZOD, a well-built market-town of Lower Hungary, in the circle of Waitzen, and on the Galga, about twenty-three miles N.E. of Pesth. The Podmanitzky family have a large and handsome mansion near it, which is celebrated for its extensive cabinet of coins and its museum of natural history. The inhabitants are remarkably industrious, good mechanics, and carry on considerable trade, as well in cloaks lined with sheepskins, which they dye blue and green and export to distant markets in great quantities, as in corn and wine, the produce of the delightful valley in which the town is situated. Aszod contains two churches, a synagogue, and nearly 3000 inhabitants. $47^\circ 39'$ N. lat., $19^\circ 29'$ E. long. (Bertuch.)

ATABEKS are the rulers of several of the small principalities into which the empire of the Seljuk Turks, soon after its establishment, became divided, during the eleventh, twelfth, and thirteenth centuries. The word Atabek is of Turkish origin, and properly signifies 'The Father of the Prince,' or, as Abulfeda explains it (*Ann. Mosl.* t. iii. p. 226. ed. Reiske), 'a faithful Parent.' According to the same author, the first chief honoured with the title of Atabek was Nizam-al-Mulk, the vizir of the third Seljuk sultan, Malek-shah, who at the same time gave him the town of Tus as his property; yet neither the title nor the honours of sovereignty remained hereditary in his family. But several powerful emirs at the court of the Seljuks, on whom this title was conferred, continued to use it after they had made themselves the almost independent masters of separate provinces, in which they enjoyed all the prerogatives of sovereignty, with this exception only, that in the public prayers at the mosques the name of the reigning Seljuk prince was mentioned before theirs. Four dynasties of Atabeks are particularly noticed in eastern history; those of Syria (and Irak), those of Azerbaijan, those of Persia, and those of Laristan.

Atabeks of Syria and Irak.—The founder of the first dynasty of Atabeks was Kasim-addaulah Aksankar, originally a mamluk or slave, but who had by degrees raised himself to a station of great influence at the Seljuk court. Sultan Malek-shah, the son of Alp Arslan, yielding to the request of the nobles, who were jealous of the power of Aksankar, in order to get rid of his presence at court, appointed him governor of the towns of Haleh, Hama, Manbej, and Laodicea (A.D. 1086). After Malek-shah's death, Aksankar, instead of taking the part of his children, became the supporter of Tutush, another Seljuk prince in Syria. But Tutush, so far from rewarding the services which Aksankar had rendered him, deprived him of a portion of his previous government, and finally of his life (A.D. 1094). Emad-eddin Zenghi, the son of Aksankar, who was only ten years old when his father was executed, early distinguished himself by military services in several Seljuk armies, and in A.D. 1122 received Basra as a fief from the Seljuk sultan Mahmud, besides which he was appointed governor of Bagdad. In consequence of the then alarming ascendancy of the Christian kingdom established by the crusaders in Palestine, Emad-eddin was sent to Mosul, in order to resist their further encroachments. He succeeded (A.D. 1127) in making himself master of Haleh, and of a considerable portion of Syria, over which country he thenceforward ruled as an independent sovereign. European chroniclers of the history of the crusades call him Sanguin, which is a corruption of Zenghi. After his death (A.D. 1145) a dissension arose between his two sons, Seif-eddin Ghazi and Nureddin Mahmud: they agreed at last that Seif-eddin should reign at Mosul, and Nureddin at Haleh. The Mosul branch continued to govern till the incursion of the Mogols into Syria, when Mosul fell into their power, A.D. 1260. To the dominion of the Atabeks of Haleh an end was put by Saladin, A.D. 1183; who, however, allowed a side-branch of this dynasty to continue in the cities of Sanjar and Nisibin till A.D. 1219.

Atabeks of Azerbaijan.—Ildeghiz, who, from the condition of a slave, had successively risen to the rank of an officer at the court of the Seljuk Sultan Mas'ud, was, in A.D. 1136, invested with the dignity of Atabek, and at the same time appointed governor of Azerbaijan and Kurdistan. He kept an army of fifty thousand horse, and increased his dominions by conquest. Though still under allegiance to the sultan, he was almost independent in the government of Azerbaijan.

Four of his descendants successively ruled over Azerbaijan till the year 1225, when they were obliged to yield to the power of Jelal-eddin, sultan of Khwarezm.

Atabeks of Persia.—A line of Atabeks, of Turcoman origin, the descendants of Salgar, ruled over Fars, or Persia Proper, from A.D. 1148 till 1264. The first of these Atabeks was Mozaffer-eddin, and he was followed by ten others, the reigns of some of whom were, however, of very short duration. Their residence was at Shiraz. The last of this dynasty was Ayesha Khatun, a princess, who was confirmed by Hulagu in her character as sovereign, but reigned no longer than one year, and died in A.D. 1264. From their ancestor, Salgar, these Atabeks of Persia are sometimes named Salgarides.

Atabeks of Laristan.—Abu Taher, an officer of the Atabeks of Persia, had been sent with an army into Laristan, a province on the north-eastern side of the Persian Gulf. He conquered it, but instead of giving it up to his masters, he assumed himself the independent dominion over it, and took the title of Atabek. Takla, the grandson and third successor of Abu Taher, was reigning over Laristan when Hulagu invaded the country, who deposed and killed him, but allowed his son, Shems-eddin Alp Argun, to succeed him in the government. By the permission, and with the support, of the Mogol emperors, Yussuf Shah, the son of Alp Argun, followed next, and he was succeeded by his son Afrasiab. The latter had, by several acts of cruelty, drawn upon himself the displeasure of the emperor Gazan Khan, who ordered him to be executed, and appointed Nosrat-eddin Ahmed, a son of Alp Argun, as his successor. He was followed by Rohn-eddin, a son of Yussuf Shah. Mozaffer-eddin Afrasiab, the son and successor of Rohn-eddin, was the last of the Atabeks of Laristan. (See D'Herbelot, *Bibliothèque Orientale*, art. Atabekian. De Guignes, *Histoire des Huns*, vol. i. p. 234, &c.)

ATACA'MA is a district belonging to the department of Potosi in Bolivia, in South America, and comprehends all the country of that republic which lies to the west of the Andes along the Pacific Ocean. It is of considerable extent, its northern boundary being formed by the river Loa, which separates it from Peru, and runs between 21° and 22° S. lat., and its southern by the river Salado, which partly divides it from Chili, and flows near 26° S. lat., so that it extends along the coast upwards of 210 miles, with a breadth of from 25 to 40 miles. It is divided into the Upper (Sierra) and Lower country. The Sierra comprehends the smaller part of its surface, that which lies on the N.E. within the chain of the Andes, and contains some fertile valleys, in which the common fruits and seeds of the South American Sierras are cultivated. The surrounding mountains contain mines of gold and silver, but they are not worked, and are inhabited by numerous herds of vicuñas, which the Indians hunt, selling their skin and eating their flesh, which is tender and of excellent taste. The Lower country presents over nearly all its surface nothing but an uninhabited and uninhabitable desert, consisting of wide plains covered with a dark brown, and in some places quite black sand, with here and there a streak of white. On the plains rise some high ridges and a few immense rounded knolls; but in no part are any traces of vegetation to be discovered. This description is particularly applicable to the southern part, which extends towards the boundary of Chili, in which many Spaniards perished for want of water at the time of the first conquest, and which is known under the name of the desert of Atacama. Towards the boundary of Peru, a few rivers descend from the Andes, and along their courses valleys extend, in which a rich vegetation is displayed, the soil producing bananas, cotton, figs, vines, and other fruits and vegetables. The most considerable of these rivers is the Cobiya, at the mouth of which is a good harbour and a small town, the inhabitants of which are principally occupied with fishing for congers, which they salt and export to the interior and to other ports: this town is now called Puerto de la Mar. In other parts of the coast a species of cod, called *tollo*, is caught in abundance and likewise exported. The interior districts contain veins of crystal of various colours, of jasper, talc, copper, blue vitriol, and alum. No rain ever falls on this coast, but in a few places the soil is occasionally refreshed by mists and dews. In the desert, sand-spouts are of frequent occurrence. (Alcedo, Captain Basil Hall, Humboldt.)

ATAHUALLPA, called by some historians **ATABALIPA**, was the son of Huayna Capac, the eleventh Inca of

Perú, by a princess of Quito, or Quito. According to the laws of Perú the incas were only allowed to marry their sisters, or some other female of their own family: every other union was considered unlawful, and the fruit of such a union illegitimate. Atahualpa could not, on this account, succeed his father. Huayna Capac, who loved him passionately, considering, moreover, the rank of his mother, was desirous that Atahualpa should succeed him in the throne of Quito, which kingdom had been added to his empire. He accordingly communicated his desire to the hereditary prince Huascar, who acquiesced in the will of his father; and at the death of the inca, which, according to Garcilaso, took place in 1523, Atahualpa ascended the throne of Quito. Huascar promised his brother to leave him undisturbed in the possession of his kingdom, on condition that he should not make any new conquests on his own territory, and that he should render him homage as his liege lord. Atahualpa replied submissively to this proposal, and asked his brother's permission to visit Cuzco to celebrate the obsequies of their deceased father, and likewise to render him homage. Having obtained this permission, he gave secret orders to his principal officers to assemble as many men as they could, and without making any warlike appearance, to march towards Cuzco in small bodies. In this manner he assembled an army of more than 30,000 veterans who had served under his father. These preparations, secretly as they were made, excited suspicion in the minds of some of the old governors of the provinces, who acquainted Huascar with their fears. But before the inca had time to prepare himself, more than 20,000 men belonging to Atahualpa had crossed the Apurimac, and were within a hundred miles of Cuzco. They then cast off the mask, and presented themselves as enemies. Huascar assembled as large an army as he could muster, and offered them battle in a plain six miles from Cuzco. The battle was obstinate and bloody, and at last victory declared in favour of Atahualpa. Huascar attempted to escape with a thousand men, but was taken prisoner. A messenger was sent to his brother, who was at Saussa, or Jauja, to acquaint him with the result of the battle. He ordered Huascar to be kept in chains, and summoned all the individuals of the inca's family to appear at Cuzco, under the specious pretext of some affairs of importance both to the family and to the state; but his real intention was to destroy them, that he might possess the throne without fear of being disturbed. Atahualpa accordingly gave orders to his general, who caused more than 300 of the inca's family to be put to death, without sparing either age or sex. Some were beheaded, others precipitated from rocks, women and children were hung by their hair from trees, and left to die there. These inhuman executions, which were continued during two years, took place in a field near Cuzco, called, on that account, *Yahuarpampa*, or the field of blood. The unfortunate Huascar whenever one of these atrocious acts took place, was brought to the scene of blood, dressed in mourning, and with a rope tied round his neck, to witness the death of his relations. The servants of the household of the inca were likewise destroyed, and as these were the inhabitants of all the towns in the neighbourhood of Cuzco, the number of the victims cannot be estimated.

In the midst of these civil discords, the Spaniards arrived in Peru. Atahualpa, who was at Casamarca, or Caxamarca, terrified at the accounts which he received of them, and knowing that the unfortunate Huascar had sought their assistance, sent an embassy, accompanied by a rich present, with a view to gain the favour of the invaders. The ambassador was very civilly received by Francisco Pizarro, who, on his part, sent his brother Hernando to visit Atahualpa, to offer him his friendship, and to acquaint him with his intentions, which were no other than to contribute with all his power to the happiness of both him and his subjects. On the following day, Atahualpa, accompanied by 8000 men unarmed, went to visit Pizarro. On his arrival, Father Valverde, in a long harangue, endeavoured to acquaint the inca with the doctrines of the catholic religion, and declared to him that his kingdom had been given by the pope, the vicar of God, to the mighty Emperor Carlos, and that consequently he was bound to surrender it, otherwise both he and his subjects would be destroyed with fire and sword. The inca, amazed at such a proposal, and, uttering a deep sigh, answered by his interpreter, that, comparing the tenour of their former with their present discourse, he could infer nothing else but that

both they and their king were either tyrants, who went about the world plundering and usurping the kingdoms of others, or a scourge sent by God to punish mankind: that he could not conceive how he was to acknowledge three lords, and surrender his kingdom only to one: that if, with any justice, he could be bound to pay tribute to any, it should be to the pope, or rather to God, and not to the emperor. The Spaniards would not suffer the inca to finish his discourse. The cavalry fell upon the unarmed multitude who had assembled, attracted by the novelty of the sight, sabring and trampling under the feet of their horses old men, women, and children. Francisco Pizarro, at the head of the infantry, attacked the guard of Atahualpa, who, at the command of their inca, offered no resistance; the Spaniards, after seizing Atahualpa, and loading him with chains, conducted him as a prisoner to the royal seat of the incas at Caxamarca.

Atahualpa offered Pizarro, for his ransom, to cover the pavement of his prison with vessels full of gold and silver; and having observed, by the countenances of the Spaniards, that they either were not satisfied with the offer, or doubted the possibility of its accomplishment, he raised his hand as high as he could reach, and making a mark in the wall, promised to fill the room up to that height with the same precious metals. Pizarro agreed to this proposal, and the inca gave the necessary orders for procuring the ransom. Atahualpa, though imprisoned, was in communication with his generals, and ordered them to remove his brother to Jauja. Here Huascar saw two officers of Pizarro, and again implored their interference in his behalf. This circumstance having reached the ears of Atahualpa, he ordered him to be put to death. The unfortunate Huascar, in his last moments, said, 'I am deprived of my kingdom and existence by a tyrant, but he will not enjoy long his usurped power.'

A Peruvian renegade, called Felipillo, who served as an interpreter to the Spaniards, aiming at the possession of one of the wives of Atahualpa, falsely accused him of having secretly given orders to his subjects to arm against them. The inca was accordingly brought to trial. Some of the Spanish officers, whose names are mentioned by Garcilaso, remonstrated against the injustice of such proceedings, and endeavoured to prove to those who were of a contrary opinion that they would disgrace the Spanish character by their ungrateful behaviour to a man who had received them with such kindness, and to whom they had moreover pledged their word to set him at liberty after having received the sum agreed upon for his ransom; and finally, that if he was to be tried, he should be sent to Spain to be judged by the emperor. Almagro and his party, who had just arrived, and were eager to seize upon the treasure of Atahualpa, pretended that he ought to be tried by a military commission. This last opinion prevailed. He was tried and condemned to be burned alive on several false and ridiculous charges, the chief of which were the false one above-mentioned, and the murder of his brother. On his way to the place of execution, he desired to be baptized, in consequence of which he was strangled only. It is said that he exhibited great courage and firmness in his last moments. Atahualpa is described by the Spanish historians as a man of handsome and noble presence, of a clear, quick, and penetrating mind, cunning, sagacious, and brave. Garcilaso relates of him the following anecdote:—while in prison he had observed some Spaniards reading and writing, and he thought that this accomplishment was not a thing learnt, but a faculty which all the Spaniards possessed; and in order to verify his opinion, he asked one soldier to write the word Dios (God) on the nail of his thumb. He then asked every Spaniard that came near him to read it, and as he received from all the same answer, he was confirmed in his opinion; but on putting the question to Francisco Pizarro, and finding that he was unable to answer it, he discovered that it was a science acquired. From that moment he formed so mean an idea of Pizarro, that he treated him with the greatest contempt.

See Vega (El Inca Garcilaso), *Comentarios Reales de los Incas*, part i., book 9, chap. 2 to the end; part ii., book 10, chap. 17, folio edition, Madrid, 1723.

ATA-MELIK, or with his complete name, ALA-EDDIN ATA-MELIK AL-JOWAINI, was born (probably A.D. 1226 or 1227) in the district of Jowain near Nishapur in Khorasan, in which country his father Boha-eddin successively filled several offices of importance under the Mogol

government. Ata-Melik received a careful education, but at an early age political employments withdrew his attention from literary pursuits. Argun, the governor of Khorasan, chose him for his companion on two journeys into Tartary, and in 1251 introduced him at the court of the Mogol emperor Mangu Khan, at Karakorum. Here Ata-Melik remained for a considerable time, and began to write his great work on the history of the Mogols, on account of which he undertook several excursions into Mawaralnahr, Turkestan, and the antient country of the Uighurs. We are not informed of the precise period at which Ata-Melik quitted Karakorum. But when Argun was, in A.D. 1255, again called to the court of Mangu Khan, he left his son Kerai-Melik, with Ata-Melik, in the camp of Sultan Hulaku, the brother of Mangu Khan, as governors of Khorasan, Irak, and Mazenderan, during his absence. Ata-Melik soon gained the entire confidence of Hulaku: as a proof of this, it is recorded that he induced him by his intercession to rebuild the town of Jenushan, which had been destroyed by the Mogols when they first conquered Khorasan. He afterwards accompanied Hulaku in his expedition against the Abbaside caliph Mostasem; and after the capture of Bagdad by the Mogols (A.D. 1258), he was appointed prefect of that city, while on his brother Shems-eddin the dignity of vizir was conferred. Both continued to hold these offices under Abaka Khan, the successor of Hulaku, and the province of Bagdad, which had suffered much from the incursion of the Mogols, began to flourish again under their administration. But in consequence of a charge of peculation brought against Ata-Melik, he was thrown into prison, and deprived of every thing he possessed, even of his wife and children, who were sold as slaves. Sultan Ahmed, the successor of Abaka Khan, relieved him from this distressing situation, and prevailed upon him, much against his wish, to resume his former office. But soon after this Argun, the son of Abaka Khan, defeated Ahmed and made himself master of Bagdad; and it appears that the apprehension of a renewal of the former rigorous judicial proceedings against himself accelerated the death of Ata-Melik, which took place a few days after Argun's entry into Bagdad (A.D. 1282). His work on the history of the Mogols, entitled *Jehan-kushai* (i. e. the conquest of the world), is by some of the most esteemed Oriental writers (c. g. Abulfaraj, Mirkhond, &c.) referred to as the principal authority on that subject. A manuscript, said to contain the greater part of it, is preserved in the Royal Library at Paris. (See a Memoir on the life and writings of Ata-Melik, by Quatremère, in the *Mines de l'Orient*, vol. i., p. 220, &c.)

ATAULPHUS, brother-in-law of Alaric, king of the Visigoths, assisted him in his invasion of Italy. After Alaric's death, near Cosenza, Ataulphus was elected his successor, A.D. 411. In the following year he led his bands out of Italy into Gaul, with the intention, as it would appear, of joining Jovinus, who had revolted against the empire, and of sharing the Gauls with him. Jovinus not being inclined to an alliance with the Goths, Ataulphus sent messengers to Honorius offering him peace, and at the same time attacked and defeated Jovinus, who was taken and put to death. Placidia, the sister of Honorius, had been for some time a captive with Ataulphus, who at last prevailed on her to give him her hand. The marriage took place at Narbo (Narbonne) in southern Gaul, at the beginning of the year A.D. 414. Ataulphus appeared on the occasion dressed after the Roman fashion, and presented his bride with many vases full of gold and jewels taken at the plunder of Rome in A.D. 410. Ataulphus afterwards passed into Spain, where he was treacherously killed at Barcelona by one of his equerries, A.D. 417. A child that he had by Placidia, and to whom he had given the name of Theodosius, died before him. Vallia, the successor of Ataulphus, restored Placidia to her brother Honorius, who gave her in marriage to the consul Constantius. (Jornandes, Zosimus, Orosius, and Gibbon.)

ATBARA, a river of Nubia. [See TACAZZA and NILK.]

ATCHAFALAYA (an Indian word, signifying *hot water*) is the upper outlet of the Mississippi, which detaches itself from the main stream on the right bank in 31° N. lat., and 14° 47' W. long. from Washington. The Atchafalaya is here about 110 yards wide, and the Mississippi nearly half a mile. When the Mississippi is low, the water sometimes runs backward from the Atchafalaya into the Great River; but when the Mississippi is at its height, there is an immense mass of water sent down the Atchafalaya, and a

great extent of country between the Atchafalaya and the Mississippi, and also to the west of the Atchafalaya, is thus annually inundated. The Atchafalaya has a general southern course for thirty-five miles till it is joined by the Courtaubieu from the N.W., which comes from the hilly pine-forests between the Red River and the head of Calcasieu. From the junction of the Courtaubieu, the Atchafalaya runs S.S.E. for twenty miles; here one stream runs into the long narrow lake called Cheetimaches, and the other branch runs eastward fifteen miles, and receives the Plaquemine, another branch of the Mississippi detached from the main stream, on the right. The Atchafalaya now runs a little E. of S. for thirty miles, and enters the bay called Atchafalaya Bay. About twenty miles above its mouth it is joined on the west by the Teche, which rises in the prairies of Opelousas, and has an entire course of about 200 miles.

The Atchafalaya is remarkable for a phenomenon called the Raft, which occurs in several places in its course. This raft consists of the rubbish brought down the Mississippi and thrown at some remote time into the Atchafalaya, where it has been caught in the bends of this narrow and tortuous stream, and has received successive augmentations by more recent floating trees. This raft is not always stationary, but when disturbed by the rise of the waters, it breaks off in large masses, which soon lodge again in some angle of the river. Several points are marked in Darby's map where the navigation is impeded by these accumulations of interlaced trees. The timber rises and falls with the river floods. The spring-tides in the Gulf of Mexico, which are not more than three feet, ascend the Atchafalaya when its waters are low to a point above the junction of this stream with the Courtaubieu—a fact which shows that this portion of the country has a very small elevation above the Gulf, or perhaps none at all. (See Darby's *Geography of the United States*.)

ATCHEEN, or ACHEEN (properly ACHEH), is one of the petty kingdoms into which the island of Sumatra is divided. It occupies the north-western extremity of the island, and borders generally on the country of the Battas. The kingdom does not extend inland farther than about fifty miles. It stretches along the coast to the south-westward as far as the town of Barus, in 2° N. lat. and 98° 30' E. long. On the northern coast the territory of Atcheen reaches as far eastward as Karti, in 5° 10' N. lat. and 97° 40' E. long.

When the Portuguese, early in the sixteenth century, were prosecuting their discoveries and conquests in the Indian Seas, a fleet of five ships, under the command of Diego Lopes de Sequeira, first reached the island of Sumatra, and anchored at Pedir, then a principal port on the north-west coast, within the kingdom of Atcheen. Here the Portuguese found trading vessels from Pegu, from Bengal, and from other eastern countries: this was in September, 1509. It was nearly a century later (June, 1602) when the first English ships visited that country. These were the fleet under the command of Sir James Lancaster, who bore a letter from the queen of England, and was received by the sovereign of Atcheen with every mark of respect. On this occasion a regular commercial treaty between the two governments was drawn up and executed. The chief object of contemplated traffic was pepper, for which article Europe was principally dependent at that time upon the Dutch. Very little advantage was taken of the treaty here mentioned until the year 1659, when the reigning queen of Atcheen, having granted some additional privileges to the English East India Company, a factory was established by that body in the capital of her dominions. The trade, however, was never very flourishing in this quarter, and may be said to have ceased upon the establishment of the Company's settlement at Benocoolen, on the south coast of Sumatra, from the neighbourhood of which place the pepper was principally collected.

A 'treaty of friendship and alliance' was concluded with the Sultan of Atcheen, in April, 1819, by Sir Stamford Raffles, acting on behalf of the government of the East India Company, whereby the right of trading freely to all the ports of that kingdom was assured to the British upon the payment of 'fixed and declared rates of duty.' By this treaty His Highness likewise engaged 'not to grant to any person whatever a monopoly of the produce of his states, and to exclude the subjects of every other European power, and likewise all Americans, from a fixed habitation or residence in his dominions.'

On the occasion of concluding this treaty, the East India Company advanced to the Sultan of Atcheen a loan of 50,000 dollars, and presented to him as a gift six pair of brass field-pieces, and a considerable quantity of ammunition and military stores.

The government of Atcheen is an hereditary monarchy, and the king or sultan is limited in his authority only by the power of the greater vassals, so that the bulk of the people are not in the enjoyment of much political liberty. The whole kingdom is divided into about 190 small districts or communities, equivalent to our parishes. These districts are grouped together in various numbers, varying from 20 to 26, under the management of a provincial governor. The state revenues are made up of offerings in grain, cattle, and money, sent from each district, and delivered at the king's store; but the principal income of the crown consists in customs-duties imposed upon the import and export of merchandise.

The climate of this part of the island is comparatively healthy. The country is more free than most of the other parts from stagnant waters and from woods, for which reason the inhabitants are likewise less liable to fevers and dysenteries.

A chain of mountains, in some parts double and in others treble, runs from near the north-western point through the whole extent of Sumatra, including, of course, the territory of Atcheen. These mountains, as well as the rivers and other principal geographical features of the country, will be described in our general account of the island.

The Atchinese are in general taller and stouter, and their complexions darker, than those of the other inhabitants of Sumatra. They are likewise considered to be of more active and industrious habits, as well as more sagacious. They are fond of commercial adventure, and their degree of knowledge, more particularly as regards other countries, is greater than that possessed by other races of Sumatrans who do not engage so largely in commerce. This superiority of character and intelligence has been attributed as much to a considerable admixture of Malay blood, as to the great intercourse which has for ages existed between their ports and the western parts of India.

The language in use among the Atchinese is one of the general dialects of the Eastern Islands: in writing they make use of the Malayan character. In religion they are followers of Mohammed, and maintain the forms and ceremonies of the Moslem faith with much strictness.

Atcheen is now no longer, as it once was, the great mart for Eastern products, but it still carries on a very considerable traffic with the Coromandel coast, to which it furnishes gold-dust, raw silk, betel-nut, pepper, sulphur, camphor, and benzoin; receiving in return salt and cotton piece-goods. The camphor and benzoin exported from Atcheen are mostly procured by internal commerce from their neighbours the Battas. A considerable trade is also carried on between Atcheen and the British settlements of Singapore and Prince of Wales's Island.

The few arts and manufactures known in other parts of Sumatra are likewise pursued in the kingdom of Atcheen, where some of them are carried to a greater degree of perfection. A fabric of thick cotton cloth and of striped or chequered stuffs is carried on, and affords a considerable supply for the Malayan peninsula. A sort of rich silk goods is also manufactured, but not to so great an extent now as formerly. This falling off has been attributed to a failure in the breed of silk-worms, but as such an accident could have been very easily repaired, it is probable that there are other causes for the decay.

The soil throughout the kingdom is for the most part light and fertile, producing abundant crops of rice and esculent vegetables, as well as of cotton and the finest tropical fruits, including the mango and mangustin, which are here of delicious quality. Cattle and all kinds of provisions are abundant and at reasonable prices, and the Atchinese display their superior intelligence as much in their better skill in agriculture as they do in their greater commercial enterprise. This kingdom furnishes the same description of animals as are common throughout the island. Elephants are found here domesticated, and were probably originally imported.

(See Marsden's *History of Sumatra*; Captain Forrest's *Voyage to the Mergui Archipelago*; and *Early Records of the East India Company*, as given in the *Appendix to the Report of the Select Committee of the House of Lords*.)

on *Foreign Trade in 1820-21*. Barros, *Asia*, Dec. II. liv. iv. cap. 3.

ATCHEEN, or ACHEEN, the capital of the kingdom of the same name in Sumatra, is situated at the north-western extremity of the island in 5° 35' N. lat., and 95° 45' E. long.

The town stands on a river which empties itself by several channels near to Atcheen-head, and is about a league from the sea, where the shipping lie in a roadstead, which is securely sheltered by several small islands. The river having a bar at its mouth, with a depth of no more than four feet at low water during spring-tides, only the small vessels of the country can enter; and even of these many are prevented from passing over the bar during the dry monsoon.

The town, which is said to be populous and to contain 8000 houses, is situated on a plain in a wide valley formed like an amphitheatre by ranges of lofty hills. The houses are all detached; they are built of bamboo and rough timber, and are mostly raised on piles some feet above the ground in order to guard against the effects of inundations. The wealth of the inhabitants has occasioned the erection of a greater number of mosques and other public buildings than are usually seen in towns of similar magnitude in the Malayan peninsula. The palace of the Sultan is built more with a view to strength than beauty, and is surrounded by a moat and strong walls. Near to the gate are several pieces of brass ordnance of an extraordinary size. Most of these are of Portuguese make, but two among them are English, and were sent as a present by King James the First to the Sultan of Atcheen; the bore of one of these pieces is eighteen inches, and of the other twenty-two inches diameter.

Owing to the plan of its construction, and the luxuriant growth of the numerous trees which surround and intersect it, the town, when seen from a short distance, has a very pleasing and picturesque appearance. The country beyond it exhibits a high degree of cultivation, and contains many small villages with white mosques, which add to the beauty of the scene. (See Marsden's *History of Sumatra* and Forrest's *Voyage to the Mergui Archipelago*.)

ATCHUJEFF, ATCHUK, or ATCHU, an island on the eastern shore of the Sea of Azof, one side of it being formed by the Sea of that name, and the other three sides by branches of the Kuban. It lies to the N.E. of Taman, or Phanagoria, but is more mountainous and as full of swamps as that island. Among the spots of note upon it are a castle with a port, also called Atchujeff, the fortifications of which are of wood; Kirman, on the principal branch of the Kuban, which was the most considerable place in this part of the world in the fourteenth century; and Cozadj, a small town on the Kumli-Kuban. The inhabitants of the island, who are Cossacks of the Black Sea, consist wholly of fishermen, and despatch large quantities of sturgeons in a dried state, caviar, fish-fat, and isinglass, to Constantinople. It is comprised at present in the Russian government of Tauria.

A^ATELES, in zoology, a genus of *Sapajous*, or American monkeys, formed by M. Geoffroy St. Hilaire, and presenting numerous and remarkable modifications of organic structure, which readily distinguish them from all other groups of quadrumanes. The most prominent characters of the genus consist in their long, attenuated, and powerfully prehensile tails; fore-hands either entirely deprived of thumbs, or having only a very small rudiment of that organ; and their dental system, which, like that of all the American quadrumanes, consists of two molar teeth in each jaw, one on each side, more than are found either in man, or in the kindred genera of the old world. The first and last of these modifications are common to the ateles and other American genera; the second is shared with them only by the *colobi*, a small African genus, consisting only of two species, neither of which has been observed by any zoologist since the days of Pennant, and with whose other characters we are very imperfectly acquainted. The ateles are further distinguished by their small round heads, corpulent bodies, and remarkably long slender limbs, which characteristics giving these animals much of the general appearance of a spider, have procured for them the appellation of *spider-monkeys*, by which they are commonly known. Like all the other quadrumanes of the new world, they are destitute of cheek pouches and callosities, characters which approximate them in some measure to the real apes. The skull of the ateles

is rounder and the brain larger than in the common monkeys; the forehead also is more elevated, and the muzzle less prominent. The eyes are widely separated from one another by the base of the nose; the nostrils open laterally, and are separated by a thick cartilaginous partition; the ear only differs from that of man in having no inferior lobe; the mouth is small; the lips thin and extensible; and the hair generally long, coarse, and of a glossy appearance.

But the organs of locomotion chiefly distinguish the ateles. The anterior extremities, in particular, are by their length and the slenderness of their form out of all proportion with the other parts; they are in general, as above observed, destitute of thumbs; or if some species are provided with this organ, it is only in a rudimentary form, and consists merely of a flat nail, or at most of a single joint. On the posterior extremities, on the contrary, the thumb is largely developed, placed far back towards the heel, and is completely opposable to the fingers. But these animals possess, in their long and muscular tail, an organ of prehension much more powerful than the other extremities; it executes, in fact, all the functions of a fifth limb, though probably, on account of its distance from the seat of sensation, it is not endowed with a very delicate sense of touch. For six or seven inches from the point it is naked and callous on the under surface; and it is by this portion that the animal hangs suspended from the branches, or swings itself from tree to tree with an ease and velocity almost incredible.

Their entire organization is adapted exclusively to an arboreal life; on the earth nothing can be more awkward and embarrassed than their motions. They trail themselves along with a slow and vacillating gait, sometimes using their long fore-arms as crutches, and resting upon their half-closed fists whilst they project the body and hind legs forward; at other times walking in a crouching position on the hind legs only, balanced by the long arms and tail, which are elevated in front and rear respectively, and always ready to take advantage of any object by which to avail themselves of their natural powers of progression. But in proportion to their embarrassment on a plain surface is their dexterity and agility among the trees of their native forests. Here they live in numerous troops, mutually support one another in danger, beat and expel the less favourably organised *sakis* from the vicinity of their cantonments, and exercise a perfect tyranny over all the other arboreal mammals of their neighbourhood. Though leaves and wild fruits compose the principal part of their food, yet they do not reject flesh, but hunt after insects and the eggs and young of birds, and are even said to adopt the stratagem of fishing for crabs with their long tails. They are exceedingly intelligent, easily domesticated, and soon become strongly attached to those who treat them kindly: they exhibit none of the petulance and insatiable curiosity of the common monkeys; their character, on the contrary, is grave, and approaches even to melancholy; but if their passions are less violent, and more difficult to excite, their affections are infinitely stronger; and if they are without the amusing tricks of the monkeys, so likewise are they without their fickleness and mischief.

Dampier relates, that when a troop of ateles have occasion to pass any of the larger rivers of South America, they select a situation in which the trees are highest and project farthest over the stream; then mounting to the top-most branches, they form a long chain by grasping one another's tails successively. This chain being allowed to hang freely at the lower end, whilst it is suspended from the top, is put in motion, and successively swung backwards and forwards till it acquires an impetus sufficient to carry it over to the opposite bank. When this is accomplished, the animal at the lower end catches the first branch which comes within his reach, and mounts to the highest, where as soon as he is firmly attached, the other end of the chain is permitted to swing, and thus the whole troop are passed over. The ateles, as well indeed as all the other American quadrumanes, are esteemed as an article of food by the native Indians; and even Europeans, whom curiosity or necessity has induced to taste it, report their flesh to be white, juicy, and agreeable. The only thing disgusting about it is a strong resemblance which the whole body, and particularly the head and hands, bear to those of a young infant. Nor is it without being strongly disposed to question the nature of the act, that European sportsmen, unac-

customed to shooting monkeys, witness for the first time the dying struggles of these animals. Without uttering a complaint, they silently watch the blood as it flows from the wound, from time to time turning their eyes upon the sportsman with an expression of reproach which cannot be misinterpreted: some travellers even go so far as to assert that the companions of the wounded individual will not only assist him to climb beyond the reach of further danger, but will even chew leaves and apply them to the wound for the purpose of stopping the hemorrhage. The following species of *ateles* have been distinguished and characterised by naturalists and travellers:—

1. The *Quata* (*A. paniscus*, Geoff.), or, as the French write it, *coaita*, is a large species, covered with long coarse hair, of a glossy black colour; the belly is protuberant, the head small and round, the limbs long and slender, the forehands entirely deprived of thumbs, the tail robust and powerful, the eyes and cheeks deeply sunk, and the face copper colour. On the back and outsides of the limbs the hair is very long and thick, but the belly and groins are nearly naked, and the mammae of the females are placed in the armpits. The hair of the head is directed forwards, and the ears, concealed beneath it, differ from those of the human species only in having no inferior lobe. This species is very common in the woods of Surinam and Brazil. It is active and intelligent, and unites considerable prudence and penetration to great gentleness of disposition. They go in large companies, and when they meet with a man or any animal which is strange to them, come down to the lower branches of the trees to examine them, and having satisfied their curiosity, begin to pelt them with sticks, and endeavour to frighten them away. They cannot leap, but exhibit the most surprising agility in swinging from tree to tree. Acosta, in his *History of the West Indies*, relates the following anecdote of a quata which belonged to the Governor of Carthagena — ‘They sent him,’ says he, ‘to the tavern for wine, putting the pot in one and the money in the other; they could not possibly get the money out of his hand before his pot was full of wine. If any children met him in the street, and threw stones at him, he would set his pot down and cast stones against the children, till he had assured his way, then would return to carry home his pot. And what is more,

has not the glossy appearance of the quata s covering. The face is nearly naked, and tan-coloured; the palms of the hands, soles of the feet, and callous part of the tail, are violet black, and the whole skin beneath the hair appears to be of the same hue. According to Humboldt, who discovered this species on the banks of the Amazon, the male and female differ in the colour of the circle which surrounds the face, and which he describes as yellow in the former and white in the latter. A young male, examined by M. Geoffroy St. Hilaire, did not present this difference; but, as in many other instances, it is probable that the young males of this species have at first the colours of the female, and that it is only on attaining their adult state that they assume those marks which distinguish their sex. It appears also that individuals differ considerably in the extent as well as the colour of this circle. The specimens described by MM. Humboldt and Geoffroy had it entirely surrounding the face; that examined by M. F. Cuvier had only the hair of the cheeks and forehead white; and, finally, there is at present a female in the gardens of the Zoological Society of London, in which the latter part alone differs in colour from the rest of the head. In this individual the hair of the forehead is much shorter and more thinly scattered than on other parts; it covers the whole extent of the forehead, is turned upwards, and is of a silvery-grey colour, whilst that of the surrounding parts is deep black. The disposition and manners differ in no respect from those of the quata.

3. The *Cayou* (*A. ater*, F. Cuv.) is considered by MM. Geoffroy and Desmarest as a variety of the quata; but M. F. Cuvier, from observations made upon the living animal, has recognised and described it as a distinct species. It must however be confessed, that it approaches so nearly to the quata as to render further observations necessary to determine the question of their specific difference. The size, form, and colour are the same in both, and the only marked distinction reported by M. Cuvier consists in the colour of the face, which is black in the cayou and copper-coloured in the quata. ‘The hair,’ says M. Cuvier, ‘is long, and of a harsh silky quality. It is rather shorter on the head and tail than on the rest of the body, where it falls backwards in the ordinary way, but on the head it is directed forward, and falls over the face.’

4. The *Marimonda* (*A. Belzebub*, Geoff.) has the top of the head, the back, sides, and external surface of the extremities black, and all the under parts, the cheeks, throat, breast, belly, inside of the limbs, and under surface of the tail for its first half, white, with a slight shade of yellow. The naked parts are violet black, except immediately about the eyes, which are surrounded by a flesh-coloured circle.

[The Quata. *Ateles paniscus*.]

rough he was a good b bber of wine, yet he would never ch it till leave was given him.’

2. The *Chuva* (*A. marginatus*, Geoff.) closely resembles quata in physiognomy, size, and proportions; the quality colour of the hair are also the same in both, except that face of the chuva is surrounded with a rim of white, which, on the forehead particularly, is broad, and directed forwards, so as to encounter the hair of the occiput, and a low crest on the top of the head. The hair of the arm is directed partially towards the elbow; like that of the body it is long and coarse, and though perfectly black,

[The Marimonda. *Ateles Belzebub*.]

This species, according to Humboldt, replaces the common quata in Spanish Guyana, where it is extremely common, and is eaten by the Indians. ‘It is,’ says this celebrated traveller, ‘an animal very slow in its movements, and of a gentle, melancholy, and timid character; if it occasionally bites, it does so only in its fits of terror. The marimondas unite in great companies, and form the most grotesque groups. All their attitudes announce the extremity of sloth

I have frequently seen them, when exposed to the heat of a tropical sun, throw their heads backwards, turn their eyes upwards, bend their arms over their backs, and remain motionless in this extraordinary position for many hours together. The young of this species appear to have the upper parts of the body mixed slightly with grey, but this mixture gradually disappears as it grows towards maturity, till the adult animal presents the uniform black above and white below, as already described.

5. The *A. melanocheir* (Geoff.), of which we are unacquainted with the native Indian name, is also a distinct species. The head, members, and tail are black, or dark brown, on the superior surface; the internal face of the arms and fore-arms as far as the wrists, and of the thighs and legs, the under surface of the tail, the throat, breast, belly, and sides of the hips, are white or silvery grey; the shoulders are yellowish grey, and the remainder of the upper parts of the body, as well as the whiskers, are pure grey: the four hands and the naked part of the tail are black, as are also the face, the cheeks, and the under half of the nose; but round the mouth and eyes is flesh-coloured. The hair is uniformly of a silky quality: that on the black and white parts is of the same colour throughout, but on the grey parts it is annulated with alternate rings of black and white. This species, as well as all those hitherto described, is entirely deprived of the fore-thumb, and does not even exhibit a rudiment of that organ. Only a single individual has been observed alive; its manners are the same as those of the ateles in general, but its habitat has not been definitely determined. A specimen preserved in the Museum of the Jardin des Plantes presents a distribution of colours which differs in some degree from what is here described; but it is not improbable that the difference arises in a great measure from the fading which naturally takes place in the colours of skins which have been long mounted and exposed to the action of the atmosphere, if indeed it be more than an accidental or individual distinction.

6. The *A. Arachnoides*, or Brown Quata, as it is called by Baron Cuvier, partakes, in fact, very much of the characters and appearance of the common quata, from which it is principally distinguished by its uniform reddish-brown colour. This species, when full grown, measures rather better than two feet in length; the tail is about a couple of inches longer than the body; the fore legs are one foot nine inches long, the hind legs one foot eight, and the hand six inches. The hair is short, fine, and soft, and that of the forehead is directed backwards, contrary to what is usually observed in the other ateles; the back and upper parts of the body are, generally speaking, well furnished, but the breast, belly, and groins are nearly naked, or at least but sparingly covered with scattered hairs, of a longer and coarser quality than those on other parts; the root of the tail is rather thick and bushy, but it is gradually attenuated towards the point, and, for the last ten inches, naked underneath. The general colour is uniform chestnut-brown, the first of these colours becoming clearer and more intense upon the head, and more especially round the eyes: the forehead is bordered by a circle of stiff coarse black hairs, beneath which a semicircle of light silvery grey passes over the eyes in the form of brows, and becomes gradually more and more obscure, till it is finally lost in the uniform reddish-brown of the temples. The face is naked and flesh-coloured, the under parts of the body of a silvery grey slightly tinged with yellow, with the exception of the abdomen, which, as well as the inner surface of the thighs, and the naked stripe underneath the tail, are of a bright red colour. The manners and habits of this species are unknown in its native forests: those which have been observed in a state of confinement exhibited all the gentleness and listless apathy of character which distinguish the ateles from the common monkeys of South America, as eminently as they do the gibbons of the Indian isles from the other quadrumanes of the Old World. Except in the total want of the thumb on the anterior extremities, the *A. Arachnoides* approaches very nearly to the following species, and appears, indeed, to be intermediate between it and the common quata.

7. The mono, or miriki (*A. hypoxanthus*, Kuhl) inhabits the forests in the interior of Brazil, and, as has just been observed, approaches very nearly to the *A. Arachnoides*, as well in the colour of its fur as in the general form and proportions of its body and members; but it is readily distinguished from that species as well as from all

the other ateles hitherto described, by the presence of a small rudimentary thumb on the fore-hands. The face also

[The Mono. *Ateles Hypoxanthus*.]

is more uniformly covered with hair than in the generally of the other species, being naked only about the region of the eyes; the hairs which compose the eyebrows are long, black, and directed upwards; the cheeks, lips, nose, and a narrow line descending from the forehead, are covered with short hairs of a pale yellowish-white colour; the chin is furnished with short hair of the same colour and quality, but intermixed with thinly scattered long black hairs, forming a species of beard, and extending over the upper lip in the form of thin moustaches. The ears are small and nearly concealed by the hair of the head, which though very long, is thickly furnished, and of a pale grey colour slightly tinged with yellow. The whole body and members are of a uniform greyish fawn colour, only differing in a greater degree of intensity which distinguishes the lower and upper parts from those beneath, and in the lighter orange tinge which predominates on the extremities. The back of the fingers are hairy down to the very nails, and there is a rudiment of a thumb on the fore feet, covered with a compressed nail.

The mono was discovered by Prince Maximilian Neuwied, during his travels in Brazil. It is the largest species of the quadrumanes which inhabit the part of the country through which that scientific traveller passed, although sufficiently common in particular districts, as to have upon the whole but a very limited geographical range. Its hide is said to be more impervious to moisture than any other description of fur known in that part of the world, and for this reason the Brazilian sportsmen have cases of the skin of the mono made to protect the locks of their guns from the rain.

8. The chameck (*A. subpentadactylus*, Geoffroy), is the last species of the genus distinctly known at present, and resembles the mono in having a small rudimentary thumb on the anterior extremities, but it is without a nail, and in other respects the two animals are sufficiently distinguished by their difference of colour and habitat. The chameck indeed approaches more nearly in external form and appearance to the quata than to any other of its congeners, being furnished with a similar coat of long dense hair, of an intense and uniform black colour; but it may be readily distinguished from that species by the presence of the rudimentary thumb on the anterior members, as well as by the

size, which considerably exceeds that of the quata. It has a protuberant muzzle, and its lips, like those of the quata, are capable of prolongation; the forehead is high; the face, cheeks, ears, and chin, are naked and of a brown colour, with a few long black hairs thinly scattered over them; the hair of the head is long, matted, and directed forwards over the forehead, that of the body and members very long and thick; the fingers, both upon the anterior and posterior extremities, are long, slender, and nearly naked; the tail is considerably longer than the body, very thick and covered at the base with close shaggy hair, but attenuated towards the point, where it is more sparingly furnished with shorter hair, and entirely naked underneath.

This species inhabits Guyana and some of the neighbouring provinces of Brazil. Von Sack, in his *Voyage to Surinam*, gives the following account of its manners under the name of quata, with which species its general appearance probably causes it to be frequently confounded. 'The quatta,' says this author, 'is of a very docile disposition, and capable of being quite domesticated: I have seen a pair of them at a gentleman's house at Paramaribo, which were left quite at liberty; when the female negroes were employed at their needlework, they used to come and sit amongst them, and play with a piece of paper, and afterwards go out to gambol upon the trees, but never went over to the neighbouring gardens; and they knew well the usual hour of dinner at their master's, when they would come to the gallery, look in at the windows, though without attempting to enter into the room, being aware that this was a liberty not allowed them; they therefore patiently waited for their dinner on the outside.'

ATELLANÆ FA'BULÆ, a species of comedy which was common among the people of Campania, and was thence introduced at Rome, where it met with much favour. The name of Atellanæ, or Atellanice, was derived from Atella, an antient town of Campania, now ruined, the site of which is about two miles S.E. of the modern town of Aversa, and near the village of Sant Elpidio. The Atellanæ were also known by the name of 'Ludi Osci,' on account of the name of the people among whom they originated. The Roman writers have transmitted to us a few brief detached traits of the nature of these plays, of which no specimen has reached us. The Atellanæ seem to have somewhat resembled the Greek Satyrical drama, with this difference, that, instead of satyrs and other fantastic characters, they had real Oscan characters, or actors speaking their own dialect, and who were the representatives of some peculiar class or description of people of that country, much in the same manner as the Brighella, Arlecchino, Polcinella, &c. of the modern Italian stage, who are meant as caricatures of the peculiarities of certain classes in their respective provinces, and who speak each his own dialect in all its native humour. Indeed these modern *maschere*, as the Italians call them, may be considered as the descendants of the old Oscan characters in the Atellanæ. One of these Oscan characters was Macchus, a sort of clown or fool. There were others called Bucones, i. e., babblers, empty talkers. (Diomedes *de Grammatica*, lib. i. and iii.) The Atellanæ differed from the *comœdia prætextata*, which represented high characters, as well as from the *tabernaria*, which exhibited vulgar ones; the Atellanæ were a mixture of high and low, pathetic and burlesque, without however degenerating into trivialities or buffoonery. They seem to have been a union of high comedy and its parody. They were also distinct from the performances of the *mimi*, who indulged in scurrilities and in obscene jokes and gestures. (Cicero, *Epistola ad Papirium*.) Macrobius (*Saturn. III.*) draws the distinction between the Atellanæ and the *mimi*; 'the latter made use of the Roman language, and not of the Oscan, like the Atellanæ; the performances of the *mimi* consisted of one act, while the Atellanæ and other comedies had five, with *exodia* (interludes consisting of songs) between the acts; lastly, the *mimi* had not the accompaniment of the tibicina, nor of vocal music like the others.' Valerius Maximus (lib. ii. ch. 4), speaking of the Atellanæ, says, that their jests were tempered by Italian strictness of taste; and Donatus extols their antique natural elegance. Even in their satirical allusions their object was to provoke joyous laughter, rather than excite feelings of hatred or contempt. It would appear that their humour dealt chiefly in ingenious allusions and equivocations clothed in decent words, the meaning of which could only be caught by the better-educated and more refined classes.

The Atellanæ were performed by Roman citizens, who were not thereby disgraced, like the common *histriones*, or actors; their names were not erased from the roll of their tribes, and they were not obliged to take off their masks at the will of the audience. In course of time, however, and in the general corruption of morals under the empire, the Atellanæ degenerated; common mercenary players appeared in them, and they became as loose in their language as the performances of the *mimi*. This may explain the different judgments given of the Atellanæ by different writers. The *exodia*, or interludes played between the acts of the Atellanæ, are mentioned by Juvenal (*Sat. VI.*), and Suetonius quotes from one of them a line in which Tiberius was alluded to as an old goat; the pun resting on the word *capris*, which means goats as well as the island (Capræ) noted as the scene of Tiberius's depravity. When Galba entered Rome, an actor in one of the Atellanæ began singing the first line of a familiar tune: 'Venit io Simius a villa,' i. e. *the baboon is come to town*, which the audience immediately took up, and continued the song in chorus, repeating the first line as a burthen.

The Atellanæ were written in verse, chiefly iambic, with a frequent recurrence of tribrachs and other trisyllabic feet. Lucius Sylla, the famous dictator, is said to have written Atellanæ. Quintus Novius, who flourished soon after Sylla's abdication, wrote about fifty plays of this kind the titles of some of them have come down to us; as *Macchus Exul*, i. e. Macchus in Exile; *Vindematores*, or the Vintagers; *Gallinaria*, or the Poulterer; *Surdus*, the Deaf Man, &c. Lucius Pomponius of Bononia, who lived about the same time, wrote *Macchus Miles*, i. e. Macchus Soldier, the *Pseudo Agamemnon*, &c. The Atellanæ afterwards fell into neglect, but were revived by a certain Mummius, mentioned by Macrobius, who however does not state the epoch of the revival. They were, as we have seen, in full vigour under the emperors. (Scaliger, *Poetices*, lib. i.; Pitiscus, *Lexicon Antiquitatum Romanarum*, &c.)

A TEMPO, in music (*Ital. in time*), signifies, that after any change in motion, by retardation or acceleration, the original movement is to be restored.

ATFĪH, a province of Vestânieh, or middle Egypt, stretching along the right or eastern bank of the Nile for nearly one hundred miles in length. It is bounded on the north by the province of Cairo; on the west by the Nile, which separates it from the province of Benisouef; on the south by the province of Minieh; and on the east by the desert and mountains which extend to the coast of the Red Sea. Atfih, the capital of the province, is a small town of about 4000 inhabitants, near the site of the antient Aphroditopolis, or city of Venus, 40 miles south of Cairo and 20 miles N. by E. of Benisouef, in 29° 28' N. lat., and 31° 28' E. long. From the village of Bayâd, which stands on the Atfih side of the Nile, opposite Benisouef, is a path leading eastwards through the rocky desert and over Mount Kaleel into the sandy plain of El Arabah, i. e. *of the chariots*, and thence to the monasteries of St. Anthony and St. Paul on Mount Kolzim, near the coast of the Red Sea. Rich quarries of marble of different colours were worked in this district in antient times. The province of Atfih is not so rich as the opposite one of Benisouef, the stripe of productive land being here much narrower on the right than on the left bank of the Nile. It contains many villages, but no place deserving the name of a town, except Atfih. (Belzoni's and Burckhardt's *Travels*, and the French work, *Description de l'Egypte*.)

ATH or **AATH**, a handsome town in the kingdom of Belgium and the province of Henegouwen (Hainault), on the Dender, an affluent of the Schelde, 50° 36' N. lat., 3° 46' E. long., and 32 miles W.S.W. of Brussels.

This town was enlarged and strengthened by Albert of Beijeren, Count of Holland and Hainault. In 1667, on the French taking Ath, it was strongly fortified by Vauban: the French lost it again in 1678. The Hôtel-de-Ville is a handsome building, and the spire of the church of St. Julian is also much admired. Ath has a new arsenal, with seven bomb-proof magazines. It has also a college with 150 pupils at present, a school of design, a school for poor children of both sexes, and eight private schools. It has also an hospital, a theatre, and an establishment for orphans. The manufactures are caps, hats, gloves, cotton and linen cloth, bleaching, and asbestus cloth. It carries on also some trade in grain, and in the products of the neighbouring country, among which are tobacco, poppies, and rape. The popu-

lation is 8789, of whom 4322 are males, and 4467 females. (Van der Maelen's *Tables*.)

Ath is also the name of one of the six districts into which Hainault is divided. It contains about 194 square miles, of which only a small part is uncultivated. The urban population is 11,831, and the rural 78,564, making a total of 90,395. The district sends one senator and two representatives to the chambers at Brussels. The whole number of children of both sexes in the schools for primary instruction (both communal and private) was 8695 in 1832, of whom 4986 were boys and 3709 girls.

ATHABASCA, or ATHAPESCOW, the name of a river and lake in the north-western territory of America. The Athabasca river, which is also called the Elk river, has its sources near the Rocky Mountains, but has not yet been sufficiently explored to admit of its course being minutely described. It flows generally in a northerly direction, but sometimes runs due east, and in its windings receives the waters of the lesser Slave Lake by its outlet the lesser Slave River; it is also joined by the Pembina, Red-Deer, Clear-Water, and Red Willow Rivers. Athabasca River falls into the lake of the same name by several channels, the principal one of which is at the south-western extremity of the lake nearly opposite to Fort Chipewyan and Fort Wedderburn, which are trading stations established by the North-West and Hudson's Bay Companies, during the time of their rivalry. In the remoter part of its course and above its confluence with Clear-Water river, the Athabasca is likewise known under the name of *Rivière à la Biche*.

Athabasca Lake, frequently called the Lake of the Hills, is situated about 170 miles south-west of the great Slave Lake. It is of an elongated shape, lying in a direction nearly east and west. It is nearly 200 miles long, but its general width, which gradually decreases towards its eastern extremity, does not exceed fourteen or fifteen miles. The northern shore of this lake is high and rocky; and to this circumstance it owes its title of Lake of the Hills. The rocks here mentioned are composed of sienite, over which a thin soil is spread, which is sufficient for the support of a variety of firs and poplars, as well as many shrubs, lichens, and mosses. The south shore of the lake, near to the forts, is quite level, and consists of alluvial soil. Lying between the different mouths of the Elk River, it is marshy in many parts and subject to be flooded. Advancing towards the east, the shore rises into barren sandy hills, incapable of supporting vegetable life; and still further in the same direction, near the mouth of Stone River, the soil is composed of primitive rocks. Fort Chipewyan, which, as already stated, is near the south western extremity of the lake, was observed by Franklin to be situated in 58° 42' N. lat., and 111° 18' W. long.

This establishment is conveniently situated for communicating with the Slave and Peace Rivers, from whence the canoes of the traders assemble in the spring and autumn. In the spring they bring the collection of furs that has been made at the different out-ports during the winter; and in the autumn they receive a supply of stores for the equipment of the Indians during the hunting season.

The residents of the two establishments at Athabasca Lake depend for subsistence almost entirely upon the fish which it supplies. The kinds which are most abundant are trout, carp, pike, methye, and attihawmegh. These are usually taken in sufficient abundance throughout the winter, at the distance of eighteen miles from the stations. On the thawing of the ice, the fish remove into some smaller lakes and the rivers on the south shore, where they are nearer to the forts; but the mode of transport by water being less certain than over the ice, it sometimes happens that the residents are kept without a supply of food for two or three days together.

The traders are also supplied with the flesh of the buffalo and moose deer by the hunters, who find these animals at some distance from the forts, and convey the meat there in a dried or pounded state.

(See Franklin's *Journey to the Shores of the Polar Sea*; Bouchette's *Statistical Survey*; McGregor's *British America*.)

ATHALIAH. The name אֶתְלִיָּה, or אֶתְלִיָּה, means *whom the Eternal remembered*.

Athaliah is considered to be the daughter of Ahab, king of Samaria (who 'did evil above all that were before him'), and of his wife Jezebel, the daughter of Ethbaal, king of the Zidonians. She is also called the daughter of Omri who was the father of Ahab; but by comparing the various passages, it seems that she was the daughter of Ahab, and grand-daughter of Omri.

Athaliah became the wife of Jehoram, king of Judah, who walked in the idolatrous ways of the house of Ahab, for 'he had the daughter of Ahab to wife, and he wrought that which was evil in the eyes of the Lord.' Jehoram died in the year B.C. 885, and the kingdom devolved upon Ahaziah his youngest son. Ahaziah reigned one year. Athaliah, who possessed much influence in the government of her son, used it for bad purposes. On the untimely death of Ahaziah, Athaliah conceived and executed the horrid purpose of a general massacre of all the male branches of the royal family. 'She arose and slew all the seed-royal of the house of Judah;' thus, by imbruing her hands in the blood of her grand-children, she completed the work of devastation which Jehu had begun.

Athaliah ascended the throne which she had thus rendered vacant B.C. 884, and reigned during six years. In the seventh year of her reign the sound of rejoicing within the precincts of the temple reached her ears, and the acclamations of the soldiers and priests proclaiming a king, brought Athaliah in person to the scene of tumult. She there found, to her great consternation, a son of Ahaziah with a crown upon his head, and acknowledged as sovereign of Judah by the assembled multitude. Jehosheba, the daughter of Jehoram, king of Judah, sister of Ahaziah (2 Kings xi. 2) and wife of Jehoiada the high-priest, had saved an infant from the general slaughter of the royal race, and had concealed him during six years within the temple, guarding him so carefully that no notice of his existence had reached Athaliah. When Joash had attained the age of seven years, Jehoiada assembled the priests and soldiers, and producing Joash before them, anointed him king. Athaliah, on reaching the crowd, endeavoured to excite a reaction in her own favour, by raising a cry of 'treason;' but in vain, for Jehoiada gave instant orders that she should be removed from the sacred inclosure and slain. The command was immediately obeyed, B.C. 878. (See 2 Kings ix. 25; xi.; 2 Chron. xxi. 5, 7—12; xxii. 2—10; xxiii.) The discovery of Joash is the subject of a fine tragedy of Racine, written by command of Madame de Maintenon, to be performed before Louis XIV. by young ladies of well-reputed families, educated in the seminary established by Madame de Maintenon at St. Cyr. The tragedy was composed for the express purpose of affording a combination of poetic beauty and dramatic interest with purity of moral sentiment and the inculcation of religious instruction.

ATHANAGILDE, a captain of the Spanish Goths, revolted against his king, Agila, and being joined by a Roman force from Gaul, sent by the emperor Justinian, defeated and killed Agila, near Seville, A.D. 554. Athanagilde was then proclaimed king of the Goths in Spain. He afterwards quarrelled with his Roman allies, whom he endeavoured, but not successfully, to drive out of Spain. He reigned, however, fourteen years over that part of the country which was occupied by the Visigoths, and his administration has been spoken of by the historians as firm and judicious. He had two daughters, one of whom, Galsuinda, he gave in marriage to Chilperic, the French king of Soissons; and the other, Brunehaut, married Siegbert, king of Metz, or Austrasia, and became famous in French history. [See BRUNEHAUT.] Athanagilde died at Toledo in 567. After an interregnum, he was succeeded by Liuva. Mariana, in his *History of Spain*, mentions a village near Guimaraens, in Portugal, which was still in his time called Athanagilda, having been built during the reign of this king.
